1819.
HIBISCUS, in Botany, designates a Greek name, of unknown derivation, for the **Acanthus** of Theophrastus, supposed to be the Marsh Mallow, or something very near it; hence the word was chosen by Linnaeus to designate a genus of that family, which had hitherto received only barbarous or ill-constructed appellations.—Linn. Gen. 356. Schreb. 468. Willd. Sp. Pl. v. 3. 806. Mart. Mill. Dict. v. 2. Ait. Hort. Kew. v. 2. 454. Cavan. Dic. fusc. 3. 143. Jull. 273. Lamarck. Illus. t. 584. Gurt. 134 (Ketmia; Tourn. t. 26.)—Clais and order, **Monadelphia Polyandria**. Nat. Ord. Columnifera, Linn. Malvaceae, Fluct.

Gen. Ch. Cal. Perianth double; the outer permanent, of many linear, sometimes fpatulate, leaves, rarely united into one at their base; inner of one leaf, cup-shaped, either five-cleft half-way down and permanent, or with five teeth only and deciduous. Cor. Petals five, roundish-oblong, narrow, at the base, spreading, attached below to the tube of the flamos. Stam. Filaments numerous, connected in their lower part into a tube, in whose upper part, both at its summit and fides, they become separate and lax; anthers kidney-shaped. **Pist.** German superior, roundish; style thread-shaped, longer than the flamos, five-cleft in its upper part; stigmas five, capitate. **Peric.** Capsule of five cells and five valves; the partitions double, contrary to the valves. **Seeds** one or more in each cell, kidney-shaped inclining to ovate.

Eff. Ch. Calyx double; the outer of many leaves or segments. Stigmas five. Capsule of five cells, with several seeds.

The species constituting the genus **Hibiscus** are a numerous tribe of the largest and finest plants of the malvaceous order. They are 36 in Syd. Veg. ed. 14th. 66 in Willdenow; yet of the former, **H. prominus**, **spinifer**, **cancellatus**, and **seyanicus**, are removed to the new genus **Pavonia**, and **H. Malvaceus** to the **Acanthus** of Banks and Solander, well marked by its convoluted corolla, ten stigmas, and pulpy fruit; see **Acanthus**. Scarcely any of them are natives of Europe. They generally grow between the tropics, yet some are found in North America, and some have been brought from the Cape of Good Hope. Though so numerous, they are not capable of being distributed into any well-defined sections or sub-divisions.—The stem is generally fburly or arborescent; rarely herbaceous with an annual root, and still more rarely so with a perennial one. Leaves alternate, flaked, simple, more or less lobed, with a pair of narrow stipulas at the base of the footstalk. Pubescence generally soft and fellated, sometimes brilfly and simple, sometimes wanting; in **H. polifolius** fealy, but this was, with great reason, thought a distinct genus by Dr. Solander. Flower-flalks axillary or terminal, all simple and single-flowered. Corolla usually large, red, purplish, or yellow with more or less of a purple spot, for the most part very ornamental; sometimes variable according to the age of the flower. The fibres of the stem are tenacious like hemp, and the juices of the whole plant very mucilaginous, sometimes accompanied by an unpleasantly fcented secretion. We do not recollect any fragrance in the blossoms, at least of those few which it has fallen to our lot to examine alive in the gardens or flovres of Europe.

The following are among the species most worthy of notice.

flowering without some artificial heat. The root is perennial.

Stems annual, about two feet high, perfectly unbranched, leafy, round, and nearly smooth. Leaves three or four inches long, two or three broad, pointed, ovate, serrated, often with two small lateral points. Flowers globose, smooth above, tody hairy beneath. Flowers large, rose-coloured, darker i the centre. Stamens and petal yellow. Siliquas very large and globose. The flower-stalks are truly axillary, not united for some distance to the footstalk of the leaf, by which it is supposed to be distinguished from H. Mofheliana; but we think, with Dr. Sims in Curtis's Botanical Magazine, that these two species are hardly to be considered as more than varieties. The latter is reprobated in Cavan. Diff. t. 65. f. 1, whatever may be the Alcea rosea perennis, s. f. 69. f. 1. (Pariti; Rhoeas Malab. v. t. 53. t. 59. Novella; Rumphi. Amb. v. 2. 218. t. 72.)—Leaves roundish-heart-shaped, undivided, pointed, crenate. Stem arborescent. Outer calyx in ten segments united half way up.—One of the most common plants in every part of the East Indies, thriving in all forts of situations and soils, and cultivated for the fake of its shade, even more than the beauty of its flowers, in towns and villages, and by road sides. The foliage resembles that of the Carolina Lime, Tila pulexens: The flowers expand in an evening, and are pale yellow, with a dark purplish stain in the bottom. A coarse cordage is made of the bark; the wood is light and white, useful for small cabinet work; the mucilage of the whole plant is applied to some medical purpures.

H. Roja-Sinensis. Linn. Sp. Pl. 977. Sm. Spicil. 7. t. 8. Curt. Mag. t. 138. Cavan. Diff. t. 69. f. 2.) Schen-erarii; Rumphi. Malab. v. 2. 25. t. 77, with a double flower, as also Flos flabellati; Rumphi. Amb. v. 2. 24. t. 8.)—Leaves ovate, pointed, serrated, smooth. Stem arborescent. (The native country of this species is uncertain, but no plant is more generally cultivated in China and the East Indies for ornament, especially the double-flowered kind, which is used on all occasions to decorate the houses, temples, &c., as roses are in England. Their shape and brilliant red colour have acquired them the appellation of the China Rose. The single flower, with its long pendulous column of flaments, and vivid crimson stigmas, is in our opinion much more elegant than the double, but is rarely seen in collections, though the latter is considered as almost essential to every hot-house. The tree is said to be as large as a hazel. The leaves are of a fine green, and smooth. Flowers large, crimson. They ferve the Europeans in India for the ignoble purpose of blackening their shoes, being rubbed upon the leather, when, which it has received a sufficient degree of colour, is polished with the hand.

H. mutabilis. Linn. Sp. Pl. 977. And. Repof. t. 228. Cavan Diff. t. 62. f. 1. (Roja-Sinensis; Ferrari Flor. 479. t. 487—499. Merian. Surin. 31. t. 31. Hina-pariti; Rhoeas Malab. v. 2. 69. t. 38.—42.)—Leaves heart-shaped, angular, five-lobed, pointed, toothed. Outer calyx of eight leaves. Capsule villose. Stem arborescent. (Native of China, Japan, and various parts of the East Indies, where, as well as in the West Indies, it is much cultivated for the beauty of its flowers, most generally double, which are white at first opening in the morning, but become rose-coloured before they fade at night. The leaves from that resemble thistle of the vine, and are roughish, variable in the length of their points. Ferrari and Rhoeas have illustrated this fine plant by an unusual profusion of plates in their several splendid works.

H. syriacus. Linn. Sp. Pl. 978. Curt. Mag. t. 83. Cavan. Diff t. 69. f. 1. (Alcea arboreeens; Camer. Hort. t. 34. Althea arboreeens; Ger. em. 935. A. frutes; Park. Parad. 369. t. 367. f. 5.)—Leaves ovate, somewhat wedge-shaped, the lobed, cut, smooth. Outer calyx of about eight leaves, as long as the inner. Stem arborecent. (Native of Syria and Carniola; a hardy shrub in our gardens, where it is popularly known by the name of Althea frutescens. It is perhaps the last shrub that comes into leaf with us, and one of the latest in flowering. The blossoms are handsome, rose-coloured with a crimson eye, produced in abundance, and liable to variations in colour which render them still more desirable. They have no scent. H. fruticosus. Cavan. Diff. t. 57. f. 1. (Leaves ovate, entire, bluish, ribbed, smooth; occasionally three-lobed. Outer calyx five-lobed, very short. Stem arboreous. Gathered on the woody mountains of the ile de Bourbon by Commeron, who, thinking it a distinct genus, intended to call it Cremonta. The above characters mark it sufficiently. The flowers are large, not much expanded, purplish, externally silky and whitish. Few of the genus are more striking either in their blossoms or foliage. The French call it Fleur de St. Louis. H. frutescens. Ait. Hort. Kew. v. 2. 456. Curt. Mag. t. 369. (Leaves deeply palmate, smooth: their segments lanceolate, somewhat serrated. Stem, stalks, and calyx smooth. (Native of Carolina, nearly hardy with us, being perennial, with an annual herbaceous stem. The flowers are peculiarly showy, being of a rich scarlet, and larger than most of their family.

H. Adelphoeina. Linn. Sp. Pl. 980. Cavan. Diff. t. 62. f. 2. (Flos mofchatus; Merian. Sur. 42. t. 2.)—Leaves with seven angles, serrated; somewhat peltate and heart-shaped at the base. Stem broadly.—Native of the East and West Indies, chiefly remarkable for the rich mufky taint of its seeds, known by the name of Bannia mofchata, for which they are cultivated in the East. The plant is shrubby, very hiripid. Leaves very deeply divided. Flowers large, yellow. Capsule two or three inches long.

H. Trinum. Linn. Sp. Pl. 981. Curt. Mag. t. 209.—Leaves in three very deep divisions, cut, somewhat pinnatid. Calyx inflated, membranous, hairy. (The beautiful Vene- tian Mallow, or Flower of an hour, is one of the few European species of Hibiscus, and also one of the few that are annual. It is commonly cultivated for the elegance of the flowers, which are sulphur-coloured, with five purple external stigmas, and a violet eye, contrasted with the yellow anthers. The purple hairy stigmas too are remarkable, as well as the bladdery hircid inner calyx. Hibiscus, in Gardening, contains plants of the shrubby and flowering exotic sorts, among which the species chiefly cultivated are, the Syrian shrubby hibiscus, or allthea frutescence (H. syriacus); the bladder hibiscus, bladder ketmia, or flower of an hour (H. trinum); the China rose hibiscus (H. rosa-fuens); and the changeable rofe hibiscus (H. mutabilis), or Martinico rose.

The first species has several varieties, as with pale purple flowers, having dark bottoms; with bright purple flowers, and black bottoms; with white flowers, and purple bottoms; with variegated flowers and dark bottoms, termed painted lady albea frutece; with pale yellow flowers, and dark bottoms; and with variegated leaves, and double flowers.

The second of the second species there are varieties, with erect purplish stems, and larger flowers, with a deeper colour: and with large paler-coloured flowers.

The last species has also a variety with double flowers, from which the single is often produced; but the seeds
of the single rarely afford plants that vary to the double fort.

Maiden of Culture.—The first species is capable of being multiplied either by seeds, layers of the branches, or cuttings of the young shoots.

In planting by seed, it should be procured from seed, and be sown in the early spring season, either in pots filled with light earth, or on a border in a warm exposure; but the former is the better method. The pots must be plunged in a gentle hot-bed, in order to bring the young plants forward. Afterwards the plants should be watered during the summer season in a moderate degree, and be protected in the winter from the effects of frost.

After the plants have had the growth of about two years they may be planted out in nursery rows, or in the places where they are ultimately to grow.

Where the layer mode is employed, the branches should be laid down into the ground in the autumnal season, sticking the shoots on the back parts at one or two of the joints, and placing them well in the earth. They must be kept pretty well rooted in the course of ten or twelve months, at which time they may be taken off, and placed out in their situations.

In using cuttings the young shoots should be preferred, which should be planted in pots of light earth early in the spring, plunging them in a mild hot-bed. They may also be planted in a shady border in the summer season. As soon as the plants are become fully rooted, they should be taken up with great care, and planted out where they are to grow, which may be done either during the autumn or in the spring.

The second species may be increased by sowing the well-ripened seeds in the autumn or spring, in patches of several seeds together, in the situations in which they are destined to grow and flower. As soon as the plants are come up, and have attained some growth, they should be thinned out to two or three plants in each patch.

The last two species are also capable of being multiplied, by sowing the seeds, when perfectly ripened, in the early spring in pots of rich light earth, plunging them directly in a moderate hot-bed, under glass frames, or, which is much better, in the bark-bed of the hot-houses. As soon as the plants have made their appearance, and acquired some few inches in growth, they must be removed separately into small pots, giving them water freely, and then replanting them in the hot-bed, where they are to be preferred.

In some cases they are likewise capable of being raised by planting cuttings made from the young shoots in pots filled with the same sort of mould, either in the spring or summer, affording them water immediately, and then placing them in the bark hot-bed. The after-management is the same as in the other sorts.

The first two species, which are hardy, afford an excellent effect in the clumps and borders, in mixture with other plants of the flowery sort; while the last two, which are tender, display considerable variety in collections of the rose and conservatory kinds, by the beauty of their flowers.

HIBISI, in Geography, a town of Asiatic Turkey, in Caramanian; 80 miles W. of Satalis.

HIDRAHIM, or St. Mary, an island in the Indian ocean, near that of Madagascar; 50 miles long and 14 wide. S. lat. 16° 56'. E. long. 51° 56'.

HIBRETPOUR, a town of Hindostan, in Lahore; 27 miles N. of Peshawar.

HICETAS, the Syracusan, in Biography, an ancient philosopher and astronomer, who flourished at an unknown period. He was probably the first person who taught that the sun and stars were fixed and permanent bodies, and that the earth had a rotatory motion. It is even said that Coper- nickus derived from this philosopher the first hint of his true system of the universe.

HICHTAT, in Geography, a town of West Florida, near the Apalachicola. N. lat. 31° 43'. W. long. 85°.

HICK, in Nautical Affairs, signifies the handle or lever of the rudder of a barge, called also the tiller.

HICKERY, in Geography, a town of America, in the state of Pennsylvania, on the Allegheny; 20 miles N.E. of Fort Franklin.

HICKES, George, in Biography, was born at Newham, in Yorkshire, in the year 1642. He was educated at North-Allerton, from whence he was admitted a scholar at St. John's college, Oxford. Soon after the Restoration, he removed to Magdalen college, where he took the degree of B.A., 1662. He went to Lincoln college in 1664, was elected fellow, and in the following year commenced M.A. He was admitted to holy orders, and undertook the office of a tutor to the college, the duties of which he discharged with great satisfaction till the year 1675, when he was obliged to seek for some change, in order to recruit his health, which had been injured by severe labour. He accompanied Sir George Wheeler on a tour on the continent, and at Paris he learnt that it was the intention of the court to revoke the edict of Nantes. In 1675 he returned to Oxford, obtained some preferment, and was soon after appointed domestic chaplain to the duke of Lauderdale, whom he attended to Scotland. Here he accepted the degree of doctor of divinity. From this period he received other preferments in the church, and among others, the deanery of Worcester, and would probably have been made bishop of Bristol, but the death of the king, while the subject was in agitation, put an end to all his future hopes of ecclesiastical promotion. He had already discovered great zeal against the principles of popery, that he could expect no favour from James II; nevertheless, he was so much of a churchman, and so stedfastly attached to the Stuart family, that he refused to take the oaths of allegiance to king William and queen Mary, was suspended, and in 1696 was deprived of his benefices. Before he quitted poli- tiiction, however, upon seeing it announced in the Gazette that the deanery of Worcester was granted to Mr. William Talbot, he drew up a claim of right to it, which, in 1691, he fixed up, in his own handwriting, over the great entrance into the choir. This paper was called by the secretary of state "Dr. Hickes's manifesto against the government," and drew upon the author a prosecution from the officers of the crown. This he anticipated, and very wisely quitted the country for concealment in the metropolis. Here and in its neighbourhood he remained unmolested till the year 1699, when the lord high chancellor Somers, out of regard for his great erudition, and as an encouragement to him in writing his dictionary of the old Northern languages, procured an act of council, by which the attorney-general was ordered to enter a noli prosequitur to all proceedings against him. He died in 1715, in the seventy-fourth year of his age. His principal works were "Institutiones Grammaticae Anglo-Saxonicae et Mediae Gothicae," 4vo; and "Antique Literature Septentrionalis, Libri duo," folio. This last is reckoned the author's master-piece, and is still held in high estimation. He was author of three volumes of sermons, and of a multitude of tracts in defence of himself, and the other non-jurors and their principles, an account of which may be found in the
the Biographia Britanica. Dr. Hickes was unquestionably a man of great learning, and very conversant in the writings of the Christian fathers, whom he regarded as the bell exponents of the Christian religion. Other authorities afford abundant evidence, by the sacrifices to which he submitted, rather than suffer his conscience to be violated, and his moral conduct is said to have been unexceptional and exemplary. Biog. Brit.

HICKES's Bay, in Geography, a bay on the N.E. coast of New Zealand, discovered by Capt. Cook in 1769, so called from Mr. Hickes, the lieutenant of the Endeavour ; 41 miles W.W.N. of Cape Runaway.

HICKES's Keys, a cluster of islets and rocks, in the bay of Honduras, near the coast of Mexico. N. lat. 17° 10'. W. long. 88° 54'.

HICKFORD, in Geography, an English dancing-master, whose school-room, in Brewer'sstreet, succeeded that in York-buildings for benefit concerts and musical performances, during the early part of the last century.

In 1731, Gimminiani Martini, the celebrated performer on the hautbois, and Arrigoni, the hautbois, had a weekly subscription concert at Hickford's room; where Carabelli, Dubourg, Clegg, and Veracini had likewise their benefits, as had all the second-rate opera singers. About the year 1744, Hickford himself established a weekly subscription concert, of which Teligny was the leader, Vincent the hautbois, Wiedman the German flute, Miller the bafion, Coreper the violoncello, and Frafi, with some Italian singers from the opera, the fingers.

This concert continued in high favour till the decease of Teligny and establishment of Gardini in this country.

HICKMAN, in Geography, a settlement of America, in Fayette county, Kentucky, on the N. fide of Kentucky river; 10 miles N. of Danville.

HICKSFORD, a post-town of America, in Greeneville county, Virginia; 209 miles from Washington.

HICKUP, Hitchcock, or Hicough, in Medicine, terms which have probably originated from the peculiar sound issued in the affection which they are used to denote, signify a rapid, convulsive, and ungenerous inspiration, effected by the motion of the diaphragm, and generally connected with irritation of the stomach. It is the ἐφαρμ. or ἐφαρμος of the Greeks, and the fingulus of the Latins.

This troublesome painmodi affection is too well known to require any minute description here. Some have considered it as a disorder of the stomach exclusively; while others more correctly assert, that the action of the diaphragm is principally concerned in producing it. It is obvious, indeed, that the peculiar distressful sound, produced during the spasm, commonly arises from an affection of some of the organs of respiration, and this is not leis obviously the diaphragm. This painmodic contraction of the diaphragm, however, is most excited in consequence of some irritation within the stomach, and especially about the upper orifice of the heart. Thus a large quantity of food, taken without drinking, or a small portion of very dry food, such as bread, will often bring on the hiccup; but it is speedily appeased, in such cases, by a draught of any liquid. Dilution of the stomach by a very copious meal, or by food imperfectly masticated, will also frequently induce a hiccup; which, of course, is easily prevented by an opposite course, temperance, and food eating. Certain acid substances, swallowed, or generated in the stomach, are apt to excite the convulsive action of the diaphragm, which constitutes hiccup. Thus various spices, especially when taken copiously, and other pungent matters, such as garlic, &c. are often produce it; and the acids, and other irritating fluids, which result from imperfect digestion, and occasion a sense of heat and uneasiness about the heart, or heart-burn, frequently excite the hiccup. Of these accounts, it may be added, the hiccup is an unpleasing symptom, and many persons have been almost as much troubled by it, as by many severe disorders.

On the other hand, hiccup is often observed to arise from the opposite state of the stomach to that of over-dilition, namely, from inanition. It is not so easy to account for this variety of the disorder, unless we suppose that the fluids, secreted within the stomach, become, during its empty state, a source of irritation adequate to excite the sympathetic action of the diaphragm. Hiccup is also apt to occur, after great evacuations by purging and vomiting, as in cholera, and after hemorrhages. And it often accompanies inflammation, or other severe irritation, in the viscera, especially those of the abdomen, in phrenitis, or inflammation of the brain, in apoplexy, in obstructions of the bowels, &c. It is very common in almost all disorders of the organs connected with digestion; thus it is generally one of the symptoms of a chronic state of the liver; and is sometimes found in simple jaundice, in which the biliary ducts are obstructed, although the liver itself is found. Sometimes it is one of the fore-runners of the epileptic paroxysm. Heberden's Comment.

From some one or other of these causes, hiccup will sometimes continue to distress the patient, not only for several months, but even for some years, at times with great constancy, and at other times with considerable intermissions. In some instances, this troublesome symptom has been known to harass a person during the space of many months, without any other signs of ill health. (See Heberden, Comment, De Morbor. Hist. et. Curat. cap. 81.) The final cause of the hiccup has been supposed to be the removal of any irritating substance from the lower part of the aetoplacous, or from the upper orifice of the stomach to a less fermentable part of that organ by the concurrence of the whole.

The hiccup, in its most ordinary form, where no particular disease is present, is a trifling affection; but when it is a symptom of other diseases, and especially of acute or febrile diseases, it is often itself a severe complaint, by the irritation which it produces, and very often indicative of danger, or of the approach of dilution. Hippocrates has founded several of his prognostic aphorisms upon this symptom. In inflammation of the bowels (enteritis), in long continued colic, in Strangulated hernia, in laceration of the rectum, intus-luscepatio, or other impediment to proper evacuation of the canal, hiccup ensues towards the close of the disease, and, when accompanied by great fulness and tension of the abdomen, with debility of the pulse, languor, and prostration of strength, is to be considered as a most unfavourable symptom. In all acute fevers it is an unpleasant symptom, implying generally a morbid condition of the abdominal viscera, or of the brain, which it is to be apprehended will terminate unfavourably. The symptom, however, has sometimes preceded a favourable change of the fever; so that the older physicians have remarked, that an exception from its indication of danger arises, when appearances of an approaching crisis concur with it. Hippocrates observes that hiccup is a bad symptom in old people after a feverous purging. (Aphorism 41. sect. 7.) It is unfavourable, indeed, after every feverous evacuation of this sort; but more particularly in the aged, whose strength is necessarily impaired. He remarks, too, that hiccup is a bad symptom in inflammation of the liver (Aph. 35. sect. 5—17. sect. 7), and that a freezing, supervening during a hiccup, removes it. Aph. 7. sect. 6.
HID

HIDDE, in Geography, a town of Arabia; 10 miles E. of Jidda.

HIDDENSON, an island in the Baltic, near the W. coast of Ueisham, about ten miles long and two broad. N. lat. 54° 35'. E. long. 13° 10'.

HIDE, in Commerce, the skin of a beast; particularly that of a bullock, cow, or horse. See Skin and TANNING. We have hides of divers denominations, according to their flate, quality, &c.

HIDE, Curried, is that which, after tanning, has passed through the currier's hands, and has thus received its last preparation, and is fitted for use. See CURRING.

HIDE, Raw, or Green Hide, is that which has not undergone any preparation; being in the same condition as when taken off the carcase.

HIDE, Salted, is a green hide, seasoned with sea-salt and alum, or salt-petre, to prevent its spoiling and corrupting, either by keeping it too long in cellars, or in transporting it too far in a hot season.

There are also hides dried in the air, sent from America; particularly those of buffalos.

HIDE, Tanned, is a hide either green, salted, or dried, farther dressed and prepared by the tanner, by paring off the hair, and steeping it in pits of lime and tan. See TANNING.

Tanned hides are commonly carried along with the artillery of an army. They are used in the fire-works for, covering powder or charged bombs from the rain or from sparks of fire. They are also used on batteries, or in a laboratory.

HIDE, or Hyde, Hyde, in our Ancient Curses, denoted a meature or quantity of land, containing so much as could be yearly tilled with a single plough.

Beda calls the hide of land familia, and defines it to be so much as was sufficient for the ordinary maintenance of one family. In other authors it is called manjum, manje, carucate, &c.

Crompton, in his juridiction. fol. 322, says, a hide of land contains one hundred acres, = 10 ares = 10 square furlongs = 4 virgates = 8 b pawres or ox-gangs = 8 nooks = 200 obolata = 400 rods = 15,000 perchs or poles = 1000 square chains = 100,000 square fathoms = 10,000,000 square links = 484,000 square yards = 1,742,000 square paces = 4,356,000 square feet, &c.: he adds, that eight hides make a knight's fee. In ancient manuscripts, the hide is fixed at 120 acres. But Dr Edward Coke notes, that a knight's fee, a hide or plough-land, a yard-land, and an ox-gang of land, do not contain any certain determinate number of acres. See CARRUCATE.

HIDE, in Geography, a river in America, which runs into the Mississipp, N. lat. 43° 24'. W. long. 92° 2'.

HIDE and Gain, in our Old Writers, signified arable land; to gain the land being as much as to till it.

HIDE-bound, a disorder of a horse or other beast, wherein his skin sticks too tight to his ribs and back, as not to be loosed from it with the hand.

The disorder is sometimes owing to poverty and bad keeping; at other times to over-riding or a sufficit, the horse being suffered when he is hot to fland long in the wet; or to a morbid dryness of the blood, which, not having its natural

HIDALGO, q. d. a son of birth, in Modern History, a title given in Spain to all who are of noble family.

HID

It is scarcely necessary to speak of the cure of kickup, since it is either fo light an affection, in general, as to require no medical assistance, on the one hand; or a symptom of some other disease, to which our attention must be chiefly directed, on the other. In the former case, it usually ceases spontaneously in a short time, or is readily removed by a little warm fluid, as tea, coffee, and the like. When it arises from over-dilution of the stomach by a too copious supply of food, or from the use of certain spices or other acid substanices, it will be in the patient's power to avoid any return of it in future from the same causes. When the kickup is more permanent and troublesome, moderate doses of the antispasmodics will commonly relieve it; probably by blunting the sensibility of the nervous coat of the stomach, and invigorating its muscular fibres. Thus a little opium or conium (cicut of the old pharmacopoeias), or a few drops of the tincture of opium and of sulphure ether, will frequently remove the paroxysm at once. When the kickup appears to be connected with the generation of acid in the stomach, it may be alleviated by magnesia, chalk, and the alkaline waters, at the same time, a light and moderate diet, with occasional laxatives, and aromatic bitters, may be used with a view to unload and strengthen the stomach. This, like many other spasmatic actions of muscular parts, may be often removed by drawing the attention of the patient strongly to any particular object, or by exciting any mental emotion; a fact, which popular observation has evinced. When the kickup is merely a symptom of some other disease, the treatment of it is a matter of very secondary importance; our efforts being of necessity directed chiefly to the removal of the primary, with the effusion or alleviation of which the kickup will of course cease or be alleviated, according to the old maxim, "substanca non est etiam materia." The treatment of such primary diseases will of course be elsewhere detailed. See Sanctorius, Med. Pract. lib. iii. part 2. lext. 2. cap. 10. Hoffmann, Syll. Med. Rat. Heberden, Comment. cap. 81. Sauvages, Noise. Method.

HICKWALL, in Ornithology, the name of a small species of wood-pecker, called by authors Priorius minor; a small bird of not above an ounce weight, very beautifully variegated with black, white, and brown. The head in the female of this species has a white spot on the crown, and in the male a red one. It clings trees like the common large wood-pecker, and like it feeds on worms and other insects which it finds there. See PECIES MINOR.

HID ISLAND, in Geography, an island of the N.W. territory of America, in Plen river, the northern head-water of the Illinois.

HIDAGE, or HYDAGE, an extraordinary tax, anciently payable to the king for every hide of land. See HIDE.

"Sunt etiam quaedam communes præfationes, quale servitio non dicuntur, nec de consuetudine veniunt, nisi cum necessitas intervenerit, vel cum vexer erat; factum habet hidagin, coragia, & caragia, & alia plural de necessitate, & ex confusum communis totius regni introducunt, & qua ad dominum non pertinet," &c. Braetan, lib. ii. cap. 6.

King Ethelred, in the year of Christ 994, upon the landing of the Danes, at Sandwich, taxed all his lands by hides. Every 310 hides of land, on this occasion, found one ship furnished, and every eight hides found one jack and one fadle, for the defence of the realm. William the Conqueror took six shillings for every hide of land in England.

HIDAGE is also used for being quit of that tax; otherwise called hide-gild.

HIDALGO, q. d. a son of birth, in Modern History, a title given in Spain to all who are of noble family.
natural course, causes the skin to shrink up and cleave to the bones.

Among the Hindustan, trees also are said to be hide-bound when the bark flakes too close.

Hind-Sind Land, in Agriculture, a term used in some districts to denote tough, poor swaid land, which has mostly been badly laid down to grass.

HIDEL, in our Ancient Statutes, signifies a place of protection or sanctuary.

HIDGILD, or Higgild, in the laws of king Canute, is explained by *peritum redemptionis forcii*; the price by which a servant was to redeem his skin from being whipped.

The word is formed from the Saxon *hild*, skin, and *gild*, payment. "Si liber felix debus operatur perdut libertatem; si servus corum perdans vel Hidgildam, *i.e.* let him be whipped (which was the punishment for servants), or let him pay for his skin; by which payment he is to be excused from whipping.

HIDRA, in Geography, a town of Africa; 110 miles W.S.W. of Tunis.

HIDRO, a mountain of Naples; 15 miles W.S.W. of Otranto.

HIDROA, *hidroa*, in Medicine, from *hidro*, sweat, signifies an eruption of milky pustules on the skin, occurring chiefly during the summer, in the south of Europe. The complaint was entitled *hidamina* and *papula hidron* by the Romans, *hidor* signifying also *sauceat*; whence we may infer their opinion of its connection with the perpiration, which the hot weather produced. It appears to be nearly the same disease as that which occurs in tropical climates during the hottest months, especially to European settlers, and is designated, from the effusion accompanying it, the *prickly heat*. See Heat, prickly.

HIDROCRITICA, a term used to express the judgments passed by physicians on their patients, on observing the sweat that have attended the disease.

HIDRONOSOS, a name given, by some authors, to that terrible disease the fudor Anglicanus, or sweating fiecks.

HIDROPYRETOS, of *hidor*, sweat, and *pyretos*, fever, the sweating fever, a name given by some to the fudor Anglicanus, or sweating fevers.

HIDROTONS, or HIDROTICS, in Medicine, the name with fudorics.

The word is composed of the Greek *hidria*, sweat.

Contrary to Oliver's *Hidroton*, *sweat-water, guaiacum, angelica, &c.* are of the number of hidrotics, or hidrotic medicines.

HIEL, in Geography, a small island of Denmark, in the Cattegat, near the coast of Jutland. *N. lat. 56° 8'. E. long. 10° 39'*

HIELMAR, a lake of Sweden, in the province of Sudermanland, about 70 miles in circumference; 62 miles W. of Stockholm.

HIELM, in Geography, a small island of Denmark, in the Cattegat, near the coast of Jutland. *N. lat. 56° 8'. E. long. 10° 39'*

HIELMAR, a lake of Sweden, in the province of Sudermanland, about 70 miles in circumference; 62 miles W. of Stockholm.

HIEMALIA, in Antiquity, the name with brumala.

HIEN, in Geography, a town of China, of the third rank, in the province of Pe-tche-li. 12 miles S. of Ho-ken.

HIEN-YAN, a town of China, of the third rank, in Chan-li; 12 miles W.S.W. of Shang-han.

HIEOU-KI, a town of China, of the third rank, in Fokien; 26 miles S of Yen-ping.

HIEOU-NHING, a town of China, of the third rank, in Hui-quang; 40 miles S. of Ou-ning.

HIERA, in Ancient Geography, one of the Cyclades, an island of the Archipelago, situated between Thera and Tharsis. This island, called the "Sayed island," was dedicated to the gods of hell, because it had been seen to shine, all on fire, from the bottom of the sea, as the effect of a volcano. Pliny says that this event took place 150 years after that which had separated Thera from Tharsis. M. de Choiseul affirms, according to father Hardouin, that there is a mistake in the dates, and that it was not till 40 years after that the island of Hiera made its appearance. In the year 1956, B. C., says Justin (l.xxx. c. 4.), there was seen to shine, after an earthquake, an island between Thera and Tharsis, which was called "Sacred," and which was dedicated to Pluto. Dion Cassius mentions the sudden appearance of a small island near that of Thera, during the reign of Claudius. Syneculus mentions it in the 56th year after Christ, and places it between Thera and Tharsis. But it appears that, some time after, there arose another island, called This, which disappeared, or was united to the "Sacred" island. Mention is made of it Pliny (l. iv. c. 12.), in Theophrastus, and in Drietius (vol. ii. p. 236.). Nothing remarkable happened afterwards till 1427, when a great explosion produced a rather great and very destructive increase to the island of Hiera, of which mention is made in some Latin verses engraved on a marble at Suse, near the church of the Jesus. In 1573 was formed, after a fresh explosion of some continuation, the "Little Kammen," such as we see it at the present day. The island Hiera, called "Old Kammen," to distinguish it from "New Kammen" (see Kammen), is upwards of a mile in length, and appears to be nothing but a mass, without regular form, of volcanic substances, and particularly of rocks of basaltic. It is covered with a little earth, mixed with pumaceous and volcanic ashes, which have given rise to the vegetation that has been there long established. This island is defore and uncultivated. In the summer only affes and mules are sent thither to graze. On the part, supposed to have been added to it at a later period, there is not as yet any trace of vegetation, and this part remains less elevated than the rest of the island. On Hiera are observed clefits somewhat considerable, which take the direction of its length, and extend almost from the one extremity to the other. These have, without doubt, been occasioned by the earthquakes which have very frequently occurred in these countries. Olivier's Travels in the Ottoman Empire.

HIERACHIOIDES, in Botany, a name given by Vailant to a genus of plants, since called by Linnaeus *Crepus*; which see.

HIERACITES, Hieracites, in Ecclesiastical History, a sect of ancient heretics, at the close of the third century, denounced, from their leader Hierax, a bookbeller of Leonium, and eminently distinguished by his extensive learning, and a venerable air and sanctity of virtue.

He absolutely denied the resurrection of the body, maintaining, that the soul alone rose again; and that the resurrection was altogether spiritual. Epiphanius furnishes us with he might have imbibed this error from Origen.

The same Hierax, and his followers, likewise condemned the use of flesh, wine, and marriage; being of opinion that they were only allowed under the Old Testament, and till the coming of Jesus Christ; but that under the new law they were prohibited, as incompatible with the kingdom of God.

St. Epiphanius produces the passages of scripture whereon he founded this doctrine. He says, that Hierax did not adopt Origen's opinion with regard to the Trinity, but allowed the Son to be really and truly begotten of the Father. He was also orthodox with respect to the Holy Ghost, excepting for some peculiarities received from the Melchisedecians, on which he had refined, maintaining that Melchisedec was the Holy Ghost. He also excluded from the kingdom of heaven children, who died before they had arrived to the use of reason.
reason. He lived a very austere life, and promoted the fame among his followers; but, after his death, they degenerated very rapidly.

HIERACIUM, in Botany, from ἱερακιός, a hawk, because hawks were suppos'd to sharpen their sight by the application of its juice to their eyes. The absurdity of the idea proves the venerable antiquity of the name. Hawkweed.—

Gen. Ch. Common Calyx imbricated, ovate, of many linear, very unequal, longitudinal and incumbent scales. Cor. compound, imbricated, uniform; the florets hermaphrodite, numerous, equal, each of one petal, ligulate, linear, abruptly, with five teeth. Stam. Filaments five, capillary, very short; anthers united into a cylindrical tube. Pil. Germen nearly ovate; style thread-shaped, the length of the flaments; filizmas two, recurved. Peric. none, except the closed, ovate, permanent calyx. Seeds solitary, short, obtusely quadrangular; down calyptral, feminine. Recept. nearly naked.

Ob. This genus is far more comprehensive in Tournefort than in Linnaeus, embracing various species of Crepis, Hypochaeris, Pilosella, &c. The Hirudinae of Vaillant have all branched items; that author separating from them, by the name of Pilosella, such as have simple radical flower-stalks.

Thirty-five species are defined in the 14th edition of the Systema Vegetabile, 70 in Wildenow's Species Plantarum, though many of the former are now sent away, by the last-mentioned author, to his Agraria and other genera. Some indeed are removed by him into this genus from Leontodon and Crepis, but its chief incease is derived from new discoveries in the mountainous parts of Europe.

The whole are commodiously and naturally divided into three sections: 1. Fl., flanks radical, single-flowered; 2. Fl., flanks radical, many-flowered; 3. Fl., item leafy.

They are, almost, without exception, perennial herbaceous plants, Hieracium glaucescens only having an annual root, and Hier. fruticosum, Wilden. n. 69, a thorny fleshy. Their herbage is commonly hairy or rough, especially the calyx and top of the flower-flanks, which are in many inferences clothed with dense, black, partly glandular, prominent, soft hairs. The leaves are simple, fine, and then spotted, unarmed, entire in such species as are but little or not at all caulifere, more or less deeply toothed, or even pinnatifid, in the leaf. Those placed on the fleshy are alternate, fleshy, or frequently clasping that part by their arrow-shaped or heart-shaped base. The flowers are diurnal, of a full golden yellow, in a very few instances orange or lemon coloured, and in still fewer pink or purplish. Though the head-down is properly described as simple, it is very generally rough, often verging towards a feathery structure.

Examples of the first sect are,

Hier. alpinum. Linn. Sp. Pl. 1124. Fl. Lap. n. 283. Lightf. Scot. 434. t. 18. Engl. Bot. t. 1110. (H. villosum alpinum, flore magno sanguine, caul. nudo; Dill. in Raff. Syst. t. 6. f. 2.) Leaves obtuse, undivided, entire or notched. Stalk alnifoliate, single-flowered. Calyx hairy.—Found on all the highest mountains of Europe, in rocky places, flowering in July. It is remarkable for its large foliaceous leaves, whose calyx is black, clothed with long dense tawny hairs. The leaves vary much in the number and depth of their marginal incisions.—Willdenow quotes for this Jacobin's Fl. Auffr. t. 191, which he had properly cited as the species immediately preceding as H. alpestris of that author, very distinct from the alpinum, in its downy more flordy calyx, regularly toothed leaves, and taller stem.

Hier. Pilosella. Linn. Sp. Pl. 1125. Curt. Lond. falc. 4. t. 54. Eng. Bot. t. 1093. Bulliard. Fr. t. 279. (Pilosella repens; Ger. em. 658.) Leaves elliptical, entire, downy beneath. Scions creeping. Stalk single-flowered, leafless.—Very common throughout Europe in dry exposed places, on gravelly banks, sunny lawns, and the tops of park walls, where it blooms from May to the end of July, expanding its bright fulgur-coloured flowers, elegantly striped at the back with crimson, to the meridian fun, “while the surrounding herbs, and even its own foliage, is withered and burnt up." The flowers close early in the afternoon. The leaves are beft with long rigid bristles, and singularly white beneath. The plant spreads widely by means of its long trailing leafy runners; on the Hills they are shorter, and the flowers larger. There is also an alpine variety, whose leaves are white on both fides.

Whether Willdenow has done right in referring the Linnean Leontodon bulbosum hither, the only species we have of that rare plant will not enable us to decide, but every character in its outward appearance shews that it ought not to be generically separated from L. tuberosa, which he reckons an Agraria.

In the second section (flanks radical, many-flowered), are H. dulcium. Linn. Sp. Pl. 125. Fl. Brit. 828. Tr. of Linn. Soc. v. 9. 226. (H. Auricula; Fl. Dan. t. 1111. H. Pilosella; Hall. Helvet. v. t. 22. Pilosella major pr.; Tabern. Kreuterb. 507.) Leaves elliptical-lanceolate, nearly entire, hairy. Scions creeping. Stalk with feather flowers. Native of rather moist mountainous pates. Mr. Hudson and Mr. Woodward are both mentioned as having gathered it in the north of England, and we have from the Cambridge garden roots, said to be natives of Scotland. It differs from the last chiefly in having the leaves green on both sides, and the flowers two, three, or four, on each stalk, of a sulphur colour underneath as well as above. Some botanists have confounded the synonyms of the present with the following, on which subject copious illustrations may be seen in the Transactions of the Linnean Soc. v. 9. 225.

H. Auricula. Linn. Sp. Pl. 1126. Fl. Brit. 829. (H. dulcium; Fl. Dan. t. 844. H. n. 52; Hall. Helvet. v. 22.) Leaves lanceolate, entire. Scions creeping. Stalk nearly leafless, many flowered, umbellate.—On mountains in various parts of Europe, especially in the most lofty situations about the Glaciers of Switzerland. Mr. Hudson mentions gathering it on Dalbed, not far from Graffiti, Wellmoreland, though sparingly. We never fix a British species. What is shown for it in the botanic gardens is a rare variety of the last. The present has fewer runners, perfectly lanceolate leaves not dilated into a round or obovate shape, except one or two of the lowest, and smaller flowers, of a deeper, almost orange colour, with a far more hairy calyx.

H. aurantiacum. Linn. Sp. Pl. 1126. Jacq. Auffr. t. 410. Don. Herb. Brit. fac. 2. 41. Sm. Eng. Bot. t. 1169. (H. hortense latifolium, five Pilosella major; Ger. n. 635.) Leaves elliptical, entire. Stem nearly leafless, simple, hairy, bearing a corollam of many flowers.—Found in mountainous woods in France, Italy, Switzerland, and Germany, but it was not known to be a native of Britain till Mr. G. Don discovered it in several woods in Banffshire, and at Craigton, near Turref, North Britain. In gardens it has long been known by the name of Grin or the Collier.
Several more species of this section are found on the continent, and many of them in Britain. The latter, as far as botanically determined, are *H. murorum*, Engl. Bot. t. 2082; *maculatum*, t. 2121; *sylvaticum*, t. 2431; *Lacunfons*, t. 2203, which we are rather inclined to place here on account of its affinity to the red, though (like *murorum* indeed,) it has but one or two stem-leaves; *paludum*, t. 1094; widely different from *murorum*, notwithstanding the fulgence of *Linneas*; the item is hollow; whole plant intensely bitter; *cerinboides*, Linn. Sp. Pl. t. 1129, found in the Highlands, by Mr. G. Doyle; *mollis*, Engl. Bot. t. 2210; *villosum*, Jacq. Autr. t. 871; *sambudum*, Engl. Bot. t. 340; *maculatum*, t. 2122; *pontana*, t. 2255; and *uncialatum*, t. 1771. We have imperfect specimens of several more, either varieties or species, from Scotland, but they require to be cultivated and observed in different climates, before they can be finally settled, this being one of the most difficult of European genera, in which it vies with *Saxifraga* and *Potentilla*. S.

*Hieracum*, in Gardening, contains plants of the herbaceous hard, flowering perennial sort, of which the species most usually cultivated are, the orange-flowered hawkweed (*H. aurantiacum*); and the gum-fennecory hawkweed (*H. chondriboides*). The former is frequently distinguished by the name of golden mouse-ear, and when of a dark colour by that of Grim the collier. And it varies in the colour of the flower from red to orange, as well as for shades of yellow.

Method of Culture.—These different species of plants are capable of being increased by means of sowing the well ripened seeds early in the spring upon a bed or border of fresh earth, which has an exposure towards the east. As soon as the plants have a few inches growth, they must be removed into other beds in order to stand until the autumn, when they should be planted out where they are to remain. A better practice is, however, that of setting them where they are intended to continue.

They are also capable of being multiplied by means of slips from the roots, which should be planted in the summer or spring in the places where the plants are to remain. In each of these modes of increasing them, they should have plenty of ful supplies of water in dry seasons.

When planted in such soils as are neither too rich, nor too much filled with moisture, the roots will continue for a great number of years.

These plants give variety in the clumps, borders, and other parts of pleasure grounds, in which they should constantly be placed towards the fronts.

*Hieracium*, in *Ancient Geography*, a town of Asia, in Syria, situated to the east of the gulf of Ilissus, between two chains of mountains.

*Hieracum*, a town of Upper Egypt, in the Thebaïde, placed in Antonine’s *Itinerary* between 116v and Pefia; 20 miles from the former and 28 from the latter.

*Hieracurra*, in *Geography*, a town of Hidostan, in Golconda; 35 miles S.E. of Hydrabad.

*Hieræa*, in *Ancient Geography*, a small country of Libya.

*Hieracium Picra*, in *Pharmacy*, originally a kind of elektuary, first described by Galen, composed of aloes, camomile, arzarah, pica nard, saffron, and mastic, made up with honey, or myrrh of violets and honey.

It is denominated from the Grec *Iperos* *fater*, *babia*, because of its rare virtues; and *mens*, *amanu*, *bizer*; *aloe*, which is the base thereof, rendering it extremely bitter.

It was used to purge and cleanse the stomach, remove obstructions,
obstruction, promote the menses and hemorrhoids, and slavent the blood; but its chief use among us is in powder, for making the tintura facra.

Besides this simple littera picta, there is a compound, called 

diaconolobus facii, because coloeeyth is the base of the mixture; and it was first used, with good success, by Pachius of Antioch, in divers obliterant diseases. It is composed of coloeeyth, opoponax, aristolochia, rosinada, agaric, and other ingredients. It is used in epilepsy, apoplexy, palpitation, and lethargies; and to excite the senses, and promote the expulsion of the afterbirth.

There is also a third form of littera, called Lb ranis; but rarely used. Dr. Quincy says, it is one of the most ridiculous medicines ever contrived. It passes for a cordial, &c.

HIERA PICTA. Tractatus de. See TINTURA SACRA.

Hierapolis, or Hieropolis, in Ancient Geography, a town of Phcenicia, in the Cyrrhetic territory. Ptolemy.

—Allo, a town of Asia, in Phrygia, Ptol. —Steph. Byz. places it between Phrygia and Lydia, and says, it had hot baths and several temples. —Allo, a town of the island of Crete, which was episcopal. —Allo, a town of Caria.

—Allo, an episcopal town of Arabia, under the metropolis of Babbas, in the Moabite territory. —Allo, another episcopal town of Arabia, under the metropolis of Bothra. —Allo, a town of Asia, in Syria, called "Bambveys" and now "Mambrayy." S. W. of Zemagna, at an equal distance from a chain of mountains and the Ephrates, or two days' journey N. E. of Aleppo.

The worship of the great Syrian goddess, called "Atragat." was established in this town; but no traces now remain of her temple. The only remarkable monument is a subterraneous canal, which conduces the water from the mountains of the N. for the distance of four leagues.

The name of Hierapolis still subsists in that of another village, called "Yerabados," situated on the Ephrates.

Hierapumnal, in Geography, a town of Meckley; 60 miles S. of Munnpour.

Hierapytina, in Ancient Geography, a town of Crete, called also "Cyrrhia," "Pytna," and "Camynos," and supposed to be the same place which Ptolemy calls "Hiera Petra," or the Sacred Rock. The ruins of this city are still visible on the coast over-against the rocks called by the ancients the "Iles of Afes." Hierapytyina was one of the strongest places on the island, when Meteles undertook the conquest of Crete; but it is at present only a village known by the name of "Girapetc."
and poets, are mentioned as ornaments of his literary and philosophic pursuits. Unit. Hist. Bayts.

Hiero II. king of Syracuse, was son of Hierocles, a descendant of Gelon. His mother was a female slave, and the father was so ashamed of his offspring, that he is said to have ordered him to be exposed in the woods, where he was casually nourished with wild honey. His escape from the fangs of death was regarded as little short of a miracle, and he was on that account brought home and very carefully educated. He soon became distinguished among his companions, as well by his dexterity in all manly exercises, as by his readiness in reception of instruction. As a warrior he served in his youth under Pyrrhus king of Epirus, and at the age of twenty-five he was regarded as one of the ablest commanders of his army. On the departure of Pyrrhus from Sicily, Syracuse became a prey to the feitious. Hiero, at the head of his men, entered the city with his colleague, and assumed the reins of government. To strengthen his interest among the people he married the daughter of Leptines, a person of great authority, and committed the domestic management to his father-in-law, while he was absent in the field. There were at this time large bodies of mercenaries in pay, whose lustful and mutinous spirit was the source of constant disturbances. Hiero freed himself from these by a stratagem which was more successful than honourable. Leading the whole army against the Mamertines, a ferocious body of adventurers who had seizes upon Meletia, he formed two separate divisions of the mercenaries and Syracusians, and ordered the former to attack the enemy, pretending that he meant to support them with the latter. They entered on the conquest with the utmost degree of valour, and were in the end almost entirely cut to pieces. When Hiero saw that he had nothing now to fear from his allies, he supplied their places with the Syracusian military, who without difficulty gave the Mamertines a signal defeat, and made himself master of the surrounding country. On account of this success he was unanimously raised to the throne of Syracuse about the year 265 B.C. In a short time he offered terms of peace and alliance, which were readily accepted; and he ever after continued thefriendliest of all the foreign friends of the republic, and as a reward of his confidence he enjoyed a long and prosperous reign of almost uninterrupted tranquility. His mild and equitable rule extinguished party animosities among his people, while his attention to the interests of agriculture enabled him to patronize all the arts by which a nation is made flourishing. He undertook, and with the aid of Archimedes accomplished, some public works of great magnificence. He encouraged commerce, and fitted out numerous fleets of trading vessels to convey the superfluous harvests of Sicily to other countries, and, it is said, that the commercial spirit of Hiero was fully allied to the liberality of princely opulence. He relieved the Rhodians, after a most disastrous earthquake, with a hundred talents in money, and many other valuable donations. After the fatal battle of Thapsus, in the second Punic war, he sent a fleet laden with provisions to the port of Olympos, and directed his ambassadors, after condolences expressed in the most pathetic terms, to offer to the republic these and whatever other supplies it might stand in need of; and also for the sake of the Augury to accept of a truce of Victory of pure gold, weighing three hundred pounds. The senate was highly gratified with this mark of attachment at such a period, and decreed that the Victory should be placed in the temple of Jupiter. Hiero, notwithstanding his zeal for the cause of the republic, first intimated the express wish of his aged father to a passive acquiescence in his measures, had he not been carried off by a sudden illness. Hiero died about the year 213 B.C., in the 59th year of his age, and the 54th of his reign. He was universally regretted, and the inhabitants of Sicily showed by their lamentations, that they had lost a common father and an affectionate friend. He was a liberal patron of literature, and wrote a book on agriculture.

 Hiero. See Ferro.

Hiero's Crown, in Hydstatics. The history of this crown and of the important hydrostatical proposition, to the discovery of which it gave occasion, is as follows: Hiero, king of Syracuse, having furnished a workman with a quantity of gold for making a crown, suspected that he had been cheated, and that the workman had used a greater alloy of silver than was necessary in the manufacture of it. He therefore applied to Archimedes for a discovery of the fraud. This celebrated mathematician was led by chance to a method of detecting the imposture, and of determining precisely the quantities of gold and silver of which the crown was composed; for he observed, whilst he was bathing in a tub of cold water, that as heimmerged his body in it, the water ran out; and he immediately concluded, that the water which ran out, when his whole body was immersed, was equal in bulk to his body. It is said, that he was so pleased with the discovery, as to run about naked crying out, ευπρεπες, ευπρεπες, I have found it; and others affirm, that he offered a hecatomb to Jupiter for having inspired him with the thought.

On this principle he procured a ball of gold and another of silver, exactly of the weight of the crown, conjecturing that if the crown were altogether of gold, the ball of gold would be of the same bulk as the crown, and when immersed in water, would raise the water just as high as the crown immersed; but if it were wholly of silver, the ball of silver, being immersed, would raise the water no higher than the crown immersed; and if the crown was of gold and silver mixed in a certain proportion, this proportion would be discovered by the height to which the crown would raise the water higher than the gold and lower than the silver. Accordingly, let A M L B (Plate VIII. Hydstatics, fig. 3;) be a vessel filled with water to the height D C, and let the masts of gold, equal in weight to the crown, on being immersed into the water raise the surface of it to E, and the masts of silver raise it to G; then if the height of the vessel above D C be divided into equal parts, and D F = 11, and D G = 19, it is plain the bulks of gold and silver will be as D F to D G, and the specific gravities in the inverse proportion of these quantities, or as D G to D F. If the crown be immersed, it will raise the surface of water to E; whence the proportion of the bulks of the gold and silver in the crown may be determined. For since the difference of the specific gravities of the gold and silver is D G = D F = F G = 8, if the bulk of the crown is divided into eight equal parts, it is evident, that since the specific gravities of the debased and pure gold crowns will be as the bulks inversely, that is, as D F to D E, we can easily find the point H, which will express the specific gravities of the former; for D E : D F :: D G : D H. This point H always divides the difference F G into two parts G H, H E, which have the same proportion as the parts of silver in the crown to the parts of gold; for as the point E ascends, the point H descends, and when H coincides with G, H falls upon E, and the crown becomes wholly silver; to the contrary, when E descends to F, and H ascends to G, the crown becomes wholly gold; therefore, F H will be every where to H G as the parts of gold to the parts of silver.
silver in the crown. Consequently, in the present case, because the crown, when immersed, raises the water to the height D E, and H is three divisions below G, it shews that three of the eight parts of the crown are silver, and the other five parts gold, as H is five of the divisions above F. Hence, the bulk of the gold in the crown is to that of the silver as 3 to 1. In some such method as this Archimedes deduced his proposition, viz. that the difference of the specific gravities of the compound and lighter ingredient, i.e. 5, (supposing the specific gravity of gold to silver as 19 to 11, and the specific gravity of the king's crown to be 16,) is to the difference of the specific gravities of the heavier ingredient and the compound, i.e. 3, as the bulk of gold to that of silver made use of; so that if the whole crown were divided into eight parts, the gold would consist of five, and the silver of three; and the magnitudes 5 and 3, multiplied by the specific gravities 19 and 11 respectively, will give the numbers 95 and 33, expressing the proportion of the weight of the gold to that of the silver.

This proposition of Archimedes may be demonstrated analytically in the following manner: let the magnitudes of the gold and silver in the crown be A and B, and their specific gravities as a and b; then since the absolute gravity of any body is compounded of its magnitude and specific gravity, the weight of the gold is a A, of the silver b B, and of the crown a A + b B = c × A + B, supposing c to be the specific gravity of the mixture. Hence a A = c A = b B + b B; and consequently, c = (a - c) : A : B, as before. Cotes's Hydrostatical, &c. Lectures, p. 81. Martin's Phil. Brit. vol. i. p. 305, &c. See "Specific Gravity and Equation."

**Hierobotane**, in Botany. See Vervain.

**Hierobulum**, a name given by the ancients to the colchicum.

Some have wondered that the medical writers of those times should give this name, which signifies the "sacred root," to a thing that was generally allowed to be a poison; but Wedelius has proved that it may be given, under proper regulations, with safety and great success, in malignant and petechial fevers, and in the worst kinds of the small-pox and measles. The manner he gave it was in a mixture with bezoar and plantane-root, and this he called his artecum duplicatum catholicum, or pelletinal albipharicmic. The ancients had a custom of wearing this root about their necks, by way of an amulet, to prevent infection; and it was probably from this that it obtained the name of the sacred bulb.

**Ictercyce**, in Mythology, the chief of the sacred heralds in the mysteries of Ceres, whose office was to exclude all improper persons, to preserve order in the celebration of these mysteries, and to recite the formule of initiation. The hierocyce represented Mercury, and was distinguished by the same attributes; the office was perpetual, and belonged to the family of the Cercys, the descendants of Cerys, the last son of Eumolpus.

**Hierochloe**, in Botany, from ἱερός, sacred, and κληρός, a gift or græce, named by Gmelin, because this grass has a familiar appellation in Prussia, and is there found before the church-doors on festival days, being considered as sacred to the Virgin Mary. Locel calls it Grawna Alaris. Its scent, when it begins to dry, is that of Woodruff, or the most fragrant new hay.—Gmel. Syst. v. 1. 101. Brown. Prodr. Nov. Holl. v. 1. 208. (Diarrenhenum ; Billard. Nov. Holl. v. 2. 82. See Disarrenhenum.)—Clas and order, Triandria Dignata. Nat. Ord. Gramina.

Gen. Ch. Cal. Glume of two valves, containing three florets; its valves ovate, acute, membranous, unequal. Cor. of two valves; the outer ovate, coriaceous, ribbed, often rough, sometimes shortly awned; the inner smaller, membranous, naked, emarginate, with flexed edges. Stam. Filaments three in each of the lateral florets, capillary, recurved, shorter than the corolla, two in the central or terminal one; anthers pendulous, linear, forked at each end. Fjl. in the central floret only; German superior, ovate, small; style short, approximated; stigmas longer than the corolla, linear, downy. Peric. none, except the permanent corolla. Seed solitary, ovate, pointed, small, not attached to the corolla.

Eff. Ch. Calyx of two valves, containing three florets; the lateral ones male, with three stamens; central one hermaphrodite, with two. Corolla of two valves.

A genus of smooth grasses, which in drying acquire the sweet scent of Woodruff, or new hay, approaching, to the bitter-almond flavour. The flowers are panicled; their central floret mostly without awns, the lateral ones often awned. It contains many species, according to Mr. Brown, natives of the colder parts of both hemispheres.—Examples of *Hierocloe* are

**Hierocyce**, Brown 209. (Diarrenhenum antarcticum; Billard. Nov. Holl. v. 2. 83, t. 232.)—Panicle loose, somewhat drooping. Glumes hale-ribbed, with an even keel. Lateral florets awned, downy, fringed at the margin and keel with curved hairs; central one pointed. Leaves flat.—Native of Van Diemen's Land.—Mr. Brown remarks, that *Holcus redolens*, Forst. Prodr. 52. n. 563, taken by that author from Solander's manuscripts, appears by the Bankian herbarium to be very nearly related to the above, differing only in having the inner glume of the calyx furnished with three ribs at the base, and the hairs which fringe the edges and keel of the lateral florets longer and brighter. This was found in New Zealand, and we presume it may safely be deemed a variety only. *Aira antarctica*, Forst. Prodr. 8. n. 41, suspected by La Billardiere to be his *Diarrenhenum antarcticum*, is found by Mr. Brown, on examining an authentic specimen, to be very different, and to belong to the genus *Avena*.

**Hierocyce**, (Holcus redolens; Vahl. Symb. falc. 2. 162.)—Panicle loose. Keels of the glumes bevel with little scattered teeth. Florets bearded at the base; fringed at the margin and summit. Leaves involute.—Native of Terra del Fuego. Rather larger than the foregoing, with awns as long as the corolla, whose edges are strongly fringed, and its extremity abrupt. The colour of the corolla is a rich brown; that of the calyx paler but not quite white.

Other species are the *Holcus borrelius* and *euphrasii* of Schroder's Fl. Germ. v. 1. 253, 253., included by Linnaeus in his *H. odoratus*, Sp. Pl. 14. 5; and *H. elipinatus*, sent us by Dr. Swartz as described by himself in Schroder's Journal, but we have not been able to discover it in the volumes we possess. This last has a small, dense, ovate, copper-coloured panicle, awns nearly equal to the corolla, and involute leaves. Not having access to the whole of the species of which we have incomplete information, we cannot safely attempt to define even those that we know, because we cannot contrive the whole together.

**Hierocles**, in Biography, governor of Bithynia and prefect of Alexandria, flourished about the year 303, and distinguished himself as an adversary and persecutor of the Christians. He was a man of letters, and wrote "Two Books," addressed "To the Christians," of which Lactantius has given an account (Infl. I. v.), and which have been answered by Eusebius of Caesarea. (Cont. Hier. ad Calc. em. C. 2 Evangel.)
Evangel.)—In these books Hierocles endeavoured to shew, that the sacred scriptures abound with inconformities and contradictions. He also reviled Peter and Paul, and the other disciples, as men ignorant and illiterate, some of whom got their livelihood by fishing, and propagators of falsehood. He also affirns, that Christ was banished by the Jews, and afterwards assembled a band of 900 men and committed robbery. We are also informed, that Hierocles made a comparsion of Christ with Apollonius of Tyana, giving the preference to the latter. From the account of the work of Hierocles, which is given by Laëntnianus and Euseb. Dr. Lardner, do the following conclusions:—that Hierocles had read the scriptures of the New Testament, if not of the Old likewise; that he bears testimony to the existence of the several parts of the New Testament, the Gospels, and the Epistles; that he did not dispute the genuineness or antiquity of the writings of our apostles and evangelists, but merely endeavoured to disprove them; that he did not deny the truth of our Saviour's miracles, but endeavoured to depreciate them by ascribing them to magical arts; that the respect shown to Jesus by vast numbers of men, though he was defamed by many, and though he was crucified, is a demonstration, that he was not a man of a bad character, for robbers and other malefactors, who suffer for their crimes, are never defiled nor much respected after their death; it appears also, that Hierocles was the first, who had formed a comparsion of our Saviour with Apollonius. Lardner's Works, vol. vii.

Hierocles, a Plutonic philosopher of Alexandria, flourished about A.D. 450. He was cruelly scourged at Constantinople for his adherence to the Pagan superstitions; and it is said that, in the midst of his torture, when he received force of the blood into his own hand, he threw it upon the face of his judge, repeating the following verse from Homer (Odys. i. x. 347):

κοτηλος, εις τον ουρανον, ηπειρειν ζωντανη ωτητα χειρ.

"Cyclops! since human flesh has been thy food,
Now drain this goblet, potent to digest."—Pope.

It appears, however, that notwithstanding this unjust treatment by the Christians at Constantinople, he afterwards philosophized at Alexandria in his usual manner; and hence we may infer, that the severities which the Gentile people, and particularly their learned men and philosophers, were treated, were not extremely rigorous. Hierocles wrote a treatise "On Providence," of which Photius has given large extracts, and in which he appears to be an advocate for the Eclectic philosophy, labouring to reconcile the doctrines of Plato and Aristotle concerning providence, the origin of the world, the immortality of the soul, and other subjects. He pursues the same method of philosophizing in his book "On Fate," and in his "Commentary on the Golden Verses of Pythagoras," which is still extant. Besides these, there are large fragments of other works preserved in Stobæus, and generally published together with the works above-mentioned. All these are valuable, tending to recommend and promote virtue; but not with that force which flows from revelation, enjoying every part of moral righteousness by divine authority, and with the assurance of recompenses in a future state. Lardner's Works, vol. ix. Brucker's hist. Phil. by Enfield, vol. ii.

Hierocoraces, g. d. sacred cows, in Mythology, were ministers of Mithras, or of the Sun, which the Persians worshipped under this title.

Hieroglyphic, 1. a symbol or mystic figure, used among the ancient Egyptians to cover or conceal the secrets of their theology.

The word is composed of the Greek iepi, facer, holy, and x. ev, σεμίποω, σαμίποω, to engrave; it being the custom to have the walls, doors, &c. of their temples, obelisks, &c. Engraven with such figures.

Hieroglyphics are properly emblems or signs of divine, sacred, or supernatural things; by which they are distinguished from common symbols, which are signs of sensible and natural things.

Hermes Trismegistus is commonly esteemed the inventor of hieroglyphics; he first introduced them into the Hebrew theology; from whence they have been transplanted into the Jewish and Christian. See Hieros.

Sacred things, says Hippocrates, should only be communicated to sacred persons. Hence it was, that the ancient Egyptians communicated to none but their kings and priests, and those who were to succeed to the priesthood and the crown, the secrets of nature, and the secrets of their morality and history; and these they did by a kind of cabbala, which, at the same time that it instructed them, only annulled the rest of the people. Hence the use of hieroglyphics, or mystic figures, to veil their morality, politics, &c. from profane eyes. (Sp.) This author, it may be observed, and many others, do not keep to the precise character of a hieroglyphic, but apply it to prose as well as divine things.

Hieroglyphics are a kind of real characters, which do not only denote, but in some measure express the things. Thus, according to Clemens Alexandrinus, Strum. v. a lion is the hieroglyphic of strength and fortitude; a bullock, of agriculture; a horse, of liberty; a sphinx, of subtility, &c.

Such is the opinion that has generally been embraced both by ancient and modern writers, of the origin and use of hieroglyphics; it has been almost uniformly maintained that they were invented by the Egyptian priests, in order to conceal their wisdom from the knowledge of the vulgar. But the late bishop Warburton hath, with much ingenuity and learning, endeavoured to shew, that this account is erroneous.

According to this writer, the first kind of hieroglyphics were mere pictures; because the most natural way of communicating our conceptions by marks or figures was by tracing out the images of things; and this is actually verified in the case of the Mexicans, whose only method of writing their laws and history was by this picture-writing. But the hieroglyphics invented by the Egyptians, were an improvement on this rude and inconvenient effay towards writing; for they contrived to make them both pictures and characters; in order to effect this improvement, they were obliged to proceed gradually, by first making the principal circumstance of the subject stand for the whole, as in the hieroglyphics of Horapollo, which represent a battle of two armies in array by two hands, one holding a shield, and the other a bow; then putting the instrument of the thing, whether real, or metaphorical, for the thing itself, as an eye and sceptre to represent a monarch, a chip and pilet the governor of the universe, &c. and finally, by making one thing stand for or represent another, where their observations of nature or traditional superstitions led them to discover or imagine any resemblance; thus, the universe was designed by a serpent in a circle, whose variegated spots denoted the stars; and a man who had nobly turmoimed his misfortune was represented by the skin of the hyaena, because this was supposed to furnish an invulnerable defence in battle.

The Chinese writing, he observes, was the next kind of improvement.
improvement in the use of hieroglyphics; the Egyptians joined characteristic marks to images, the Chinese threw out the images, and retained only the contracted marks, and from these marks proceeded letters. The general concurrence of different people in this method of recording their thoughts, cannot fail to be the effect of imitation, steady views, or chance; but must be considered as the uniform voice of nature, speaking to the rude conceptions of mankind; for not only the Chinese of the East, the Mexicans of the West, and the Egyptians of the South, but the Scythians, like wise, of the North, and the intermediate inhabitants of the earth, viz. the Indians, Phenicians, Ethiopians, &c. used the same way of writing by picture and hieroglyphic.

The bishop farther shows, that the several species of hieroglyphic writing took their rise from nature and necessity, and not from choice and artifice, by tracing at large the origin and progress of the art of speech. He proceeds to shew how, in process of time, the Egyptian hieroglyphics came to be employed for the vehicle of mystery. They used their hieroglyphics two ways: the one more simple, by putting the part for the whole, which was the cariologic hieroglyphic; and the other more artificial, by putting one thing, of resembling qualities, for another, called the tropical hieroglyphic; thus the moon was sometimes represented by a half circle, and sometimes by a cynocephalus. They employed their proper hieroglyphics to record openly and plainly, their laws, policies, public morals, and history, and all kinds of civil matters; this is evident from their obelisks, which were full of hieroglyphic characters designed to record singular events, memorable actions, and new inventions; and also from the celebrated inscription of the temple of Minerva at Sais, where an infant, an old man, a hawk, a fish, and a river-bird, expressed this moral fortune; All you who come into the world and go out of it know this, that the gods hate impiety. However, the tropical hieroglyphics, which were employed to divulge, gradually produced symbols which were designed to secrete or conceal; thus Egypt was sometimes expressed by the crocodile, sometimes by a burning censer with a heart upon it; where the simplicity of the first representation and the abstruseness of the latter shew, that the one was a tropical hieroglyphic for communication, and the other a tropical symbol invented for secrecy.

Enigmatical symbols were afterwards formed by the assemblage of different things, or of their properties that were less known; and though they might have been intelligible at first, yet, when the art of writing was invented, hieroglyphics were more generally diffused; the people forgot the significance of them, and the priests, retaining and cultivating the knowledge of them, because they were the repositories of their learning and history, at length applied them to the purpose of preserving the secrets of their religion.

Symbols were the true original of animal worship in Egypt, as sir John Marham conjectured, Can. Cron. p. 53. because in these hieroglyphics was recorded the history of their greater deities, their kings, and lawgivers; represented by animals and other creatures; the symbol of each god was well known and familiar to his worshippers, by means of the popular paintings and engravings on their temples, and other sacred monuments; so that the symbol presenting the idea of the god, and that idea exciting sentiments of religion, it was natural for them in their addresses to any particular god, to turn to his representative mark or symbol; especially when we consider further, that the Egyptian priests feigned a divine original for hieroglyphic characters, in order to increase the veneration of the people for them.

These would of course bring on a relative devotion to these symbolic figures, which, when it came to be paid to the living animal, would soon terminate in an ultimate worship.

Another consequence of the sacredness of the hieroglyphic characters was, that it diffused the more superstitions to deceive them on gems, and wear them as amulets or charms. This magical abuse seems not to have been much earlier than the established worship of the god Serapis, which happened under the Ptolemys, and was first brought to the general knowledge of the world by certain Christian heretics and natives of Egypt, who had mixed a number of Pagan superstitions with their Christianity. These gems, called abraxas, are frequently to be met with in the cabinets of the curios, and are engraved with all kinds of hieroglyphic characters. To these abraxas succeeded the talismans. Warburton’s Divine Legation of Moses demonstrated, vol. ii. paffim.

Hierogrammatei, a form of the Ancient Egyptians, were the priests appointed to explain mysteries of religion, and to direct the performance of the ceremonies thereof; and for this purpose they had a kind of sacred alphabetical character, different from the political one, and which the writer, cited in the last article, considers as one of the four kinds of Egyptian writing. This, as well as the epigraphic, used in civil matters, was formed by the letters of an alphabet; and, from its being used only in religious matters, was called hierogrammatic. The other two species of writing were the hieroglyphic and sambolic.

The hierogrammatei invented and wrote hieroglyphics and hieroglyphical books, and occasionally explained them, together with other matters relating to the doctrines of religion. If we may believe Suidas, they were all prophets; at least, he relates, that a hierogrammateus foretold to an ancient king of Egypt, that there would be an Ifrachel of great wisdom, virtue, and renown, who should humble Egypt. The hierogrammatei were always near the king, to assist him with their communications and counsels; the better to fix them for this, they made use of the skill and knowledge they had acquired in the arts and the motions of the heavenly lights, and even of the writings of their predeceusers, wherein their functions and duties were delivered. They were exempted from all civil employments, were reputed the first profans in dignity next the king, and bore a kind of sceptre in form of a plough-share.

After Egypt became a province of the Roman empire, the hierogrammatei sunk into neglect.

Hierology, denotes a discourse on sacred things. Among the Jews and Greeks, this term was used for the nuptial benediction.

Hieromantia, the art of divination, in Antiquity, a general name for all kinds of divination, made from the various things offered in sacrifice to the gods. They first made conjectures from the external parts and motions of the victim; then from its entrails, from the flame in which it was consumed, from the cakes and flour, from the wine and water, &c. Vide Pott, Archzol. Græc. lib. ii. cap. 14. tum. i. p. 314.

Hieromenia, the art of divination, in Ancient Chronology, a name given to the month in which the Nemean games were celebrated. It was the same with the Athenian month Bedromion, and answered to the latter end of our August and beginning of September.

Hieronmenon, among the Ancient Greeks, signified a delegate chosen by lot, and sent to the great councils of the Amphicyons, where he was to take care of what concerned religion. The hieromenones were reckoned more honourable than the other members of that assembly;
HIE

the general meetings of which were always summoned by their names prefixed to the decrees of
by that council.

Hieromnemone, composed of ἵ glare, and ὑμεν, see ψαντον), em et al., an officer in the ancient
Greek church, whose principal function was to stand behind the patriarch at the sacraments, ceremonies, &c. and Ilew him the prayers, psalms, &c. which he was to rehearse.

He also clothed the patriarch in his pontifical robes, and
affixed the places of all those who had a right to be around
him, when seated on his throne, as the master of the cere
monies now does to the pope.

The hieromnemone was commonly a deacon when he was in the priest's orders, as it sometimes happened, he was ex
cuted from drolling the patriarch in his pontifical habits.
Whether he were deacon or priest, he had always under him an officer named episcopus. He had also the keeping of the
book entitled "Contation," or book of ordination; and that
called the Prooforhnismonnos, which was a sort of a ritual.

Hieromnemone, in the Writings of the Ancients, was also
the name of a stone said to have been used in divination,
and called by others a tooth and amphioc. There is no
definition left us of it by the ancients, from which we may
guess what stone it was, or from whence it was brought.

Hieronemos, in Ancient Geography, an island of the
Mediterranean, between Sicily and Africa. Phyl.

Hieronymites, composed of ἵ glare, holy, and εἰς, eis,
names of St. Jerom. See Jeronymites.

Hierophantes, or Hierophanta, from ἵ glare, holy,
and ἐφ, eph, I appear, in Antiquity, a priest among the
Atheneans.

The hierophantes was properly the chief priest that officiated in the Eleusinia, that great solemnity sacred to
Ceres.

This office was first executed by Eschylus, and continued in his family for twelve hundred years, though, when any
person was appointed to this dignity, he was required always
to live in celibacy.

St. Jerom says, that the hierophantes extinguished the fire of
lust, by drinking cincta, or the juice of hemlock, or even
by making themselves emaciated. Apollodorus observes,
that the hierophantes instructed persons initiated into their
religion in the mysteries and duties thereof, and that it
was hence he derived his name: for the same reason he was
called prophetae, the prophet. He had officers under him
to do the same thing, or to assist him therein, who were also
called prophetae et axieta, i.e. explainers of divine things.

To the hierophantes it belonged to dress and adorn the
statues of the gods, and to bear them in processions and
solemn ceremonies.

There were also women employed in the ceremonies of the
Eleusinia, and named Hierophantides.

Hierophylax, of ἵ glare, sacred, and ἔφι, ephi, keeper of
φιλαξ, I keep, an officer in the Greek church. His func
tion is that of guardian or keeper of the holy things, uten
tils, vestments, &c. answering to our sacrist or sexton.

Hieroscoy, Hierocroa, formed of ἵ glare, sacred,
and ἐξω, exo, I view or consider, a kind of divination performed
by considering the victim, and observing every thing that
occurs during the course of the sacrifice.

Hieras, in Geography, a town of France, in the de
partment of the Charentes, and chief place of a canton, in the
district of Angouleme. The place contains 593, and the can
ton 11,112 inhabitants, on a territory of 205 kilometres, in
14 communes.

Hiering, or Letting, a sea-port of Denmark, situated
at the mouth of the Wadre, with one of the best
harbours in N. Jutland; 22 miles N.W. of Ripe. N. lat.
55° 29'. E. long. 8° 27'.

Hiertlanda, a town of Sweden, in the province of
Smalond; 30 miles N. of Wexio.

Hiertaniem, a town of Sweden, in West Bothnia;
24 miles N. of Tornez.

Higanqued, a town on the E. coast of the island of
Mindanao. N. lat. 9° 26'. E. long. 125° 51'.

Higden, Ralph, in Biography, one of the English
chroniclers, was a monk of St. Werburg's, in Chelten,
where he died in the year 1377. His hiliaral work was
titled "Polychronicon," originally written in Latin, but
translated into English by John de Trevifa, and printed by
Caxton. It is in seven book, and extends from the creation
to the year 1377. This author is valuable as having pre
served several documents relative to the times of the ancient
Britons and Saxons, from chronicles now lost. The best
edition is that of 1642. fol.

High, Altius, a term of relation applied to a body, con
sidered, according to its third dimension, or its elevation
above the horizon, or even above the ground.

High is also used to denote a person in power, dignity,
&c.

High Chancellor, Lord. See Chancellor.

High Court. See Council.

High-Bearing Cock. See Cock.

High Commission Court. See Commission.

High Constable. See Constable.

High Court of Parliament. See Parliament.

High and Dry is a phrase, among Semites, denoting
the situation of a ship when she has run aground, so as to be
seen dry upon the strand.

High Dutch is the German tongue in its greatest purity,
as spoken in Mifnia, &c. See Teutonic, &c.

High, in Mysic, is sometimes used in the same sense with
local, in opposition to hew; and sometimes in the same sense
with acute, in opposition to grace.

High Operation, in Surgery, is a method of extracting the
stone; thus called, because the stone is taken out at the upper
part of the bladder.

For the method of performing the high operation, see
Lithotomy.

The high operation is said to have been first practiced by
Roffetus: others say by Franco, a surgeon of Lauffante.
It was retrieved by Mr. Douglas, and practiced with good
successes by Mr. Ckefeld and others.

High-Peak of Derbyshire, in Geography, has too often
been mentioned as denoting some particular precipice, or
frightly rugged district, instead of being only one of the
hundreds of the county, and including a great portion of
well cultivated and populous tracts. What further shews
this mistake, as Mr. Facer observes in his "Report on
Derbyshire," is, that the Low Peak hundred, or precipitate
of Wirkworth, includes all the high and rugged lands on
the west border of Derbyshire, from Ashburnham, almost to
Whaley bridge, including Axe-edge, and others of its
highest hills.

High Places. See Grove.

High Point, in Geography, a cape on the N. coast of the
island of Barbadoes. N. lat. 13° 22'. W. long. 58° 32'.

High Priory. See Pontiff.

High Relic. See Relic.

High Sea, or ocean, is that far from land. See Sea.

High Steward, Lord. See Steward.

High Taper, in Botany. See Mulelein.

High Town, in Geography, a town of America, in the
state of Georgia; 112 miles W. of Tuglebo.

High
High Tor, at Matlock, is the name of a very high and perpendicular rock of lime-stone alternating with toad-stone, amygdaloid, or bafalt, close on the E. side of the Derwent river, about 3½ miles S.W. of Matlock church; a portion of the flat-topped hill from which this remarkable cliff may be found in the Philosophical Magazine, vol. xxxii. plate 2.

High Treason. See TREASON.

High Treasurers. See TREASURER.

High Water, is that state of the tides when they cease to flow up, or the greatest height of the flood-tide. See Tide.

High-aged Cockles, in Natural History, is the name of a species of follic-shells, found in great numbers in the Bath free-stone, on King's Dawn, near Bath, along with other shells, called piddocks, and two other kinds. Mr. Walcott, in his admirals found near Bath, figure 39, represents this shell, and describes it as having many ribs from the hinge to the hinges; beak-pointed; margin with a high wave; and says that it is common on the ploughed fields of some farms backlands.

High Way, Via Regia, a free passage for the king's subjects on which account it is called the king's high-way though the freehold of the soil belongs to the lord of the manor, or the owner of the land. (2 Inst. 205.) Those ways that lead from one town to another, and such as are drift or cart-ways, and any for all travellers in great roads, or that communicate with them, are high-ways only; and their repair is under the care of surveyors. A nuisance in a high-way is a common nuisance, and punishable by indictment; but a way to a parish-church, or to the common fields of a town, or to a private-houie, or, perhaps, to a village which terminates there, and is for the benefit of the particular inhabitants of such parish, house, or village only, may be called a private-way, but not a high-way, because it belongeth not to all the king's subjects, but only to some particular persons, each of whom, as it seems, may have an action on the road for a nuisance therein. (1 Hawk. 201.) So if I have a private way without a gate, and a gate is hung up, an action lies upon the cause, for I have not my way as I had before. (Litt. R. 267.) So if one grants me a way, and afterwards digs trenches in it to my hindrance, I may fill them up again. (Godb. 53.) All private ways are to be repaired by those who use them.

A river that is common to all men, is also called a high-way. 1 Hawk. 201.

Where a high-way lies within a parish, the parish is bound to repair it, unless it appears that the same ought to be repaired by some particular person, either by reason of tenure or prescription. At common law it is said that all the country ought to make good the repairs of a high-way, where no particular persons are bound to do it, because the whole country have their cause and passage by that way.

If a high-way leading through a field is out of repair, travellers may justify going out of the track, though there be corn fowed; and in case a high-way is not sufficient, any passerby may break down the inclosure, and go over the land adjoining, until a sufficient way be made. All kinds of injuries to high-ways, that render them less commodious to travellers, are deemed nuisances; such as laying logs of timber in them, erecting gates, or making hedges across them, permitting boughs of trees to hang over them, &c. By Stat. 13 Geo. III. cap. 78, no tree or bush is to be allowed to grow or stand within fifteen feet of the centre of the high-way, on forfeitures of 10l. by the owner. The possessors of land next adjoining shall cut, prune, or plash their hedges, and let trees growing in or near such hedges, or be liable to a complaint of the surveyor, after ten days notice; and the justices at a special session shall order such hedges to be cut or plashed, and such trees to be lopped; and the possessor, who refuses to comply within ten days after notice of such order, shall forfeit 21. for every twenty-four feet in length of such hedge, and 21. for every tree; the surveyor shall order the same to be done, and the possessor, beside the penalties, shall pay the charges of doing the same, to be levied by diff'rents, by warrant of one justice. The occupiers of such lands shall keep their ditches, drains, and water-courses, in proper order, on forfeiture of 10l. after ten days notice given by the surveyor. No fome, timber, foil, or other matter, shall be laid in the high-way, so as to obstruct or prejudice it, and remain there five days after notice by the surveyor, on forfeiture of 10l. and if such fome, &c. shall be laid within fifteen feet of the centre of the high-way, the owner of the adjacent lands, after five days notice, may remove and dispose of the same to his own use. Persons making encroachments on the high-way by any fence, or breaking up the soil, within fifteen feet from its centre, shall forfeit 40l. to the informer, and the surveyor shall cause the damage to be repaired by the offender; and one justice may levy the penalty and expense by diff'rents. The surveyor is required to give written notice to those who offend in these respects; and if they do not comply within twenty days after such notice, he shall proceed to remove nuisances, &c. to cleanse ditches, &c. and to cut hedges, &c. at the expense of the offender, who shall besides forfeit for his neglect one penny for every foot in length. If the high-way be wilfully obstructed by carriages or implements of husbandry, the person offending shall forfeit 10l.

It is farther enacted by the same statute, 13 Geo. III. cap. 78. that no driver of any cart, dray, or waggon, shall ride upon such carriages, without having some person on foot to guide the same, excepting such carriages as are conducted by persons holding the reins of any horse or horses drawing them; or damage or obstruct the passage of any person or carriage in the street or high-way, or quit the high-way, or wilfully be at such a distance from his carriage, so that he cannot have the government of the horses, &c. drawing the same; or refuse or neglect to make way for loaded carriages; or drive a carriage not having the owner's name, and refuse to disclose it, under the penalty of forfeiting any sum not exceeding 10l. if the driver be not the owner of the carriage; and if he be the owner, any sum not exceeding 20l. on conviction by confession, view of the justice, or oath of one witness, before one justice. Owners of carriages are also required to have their names and places of abode painted in large legible letters on some conspicuous part; and the owner of every flag waggon, or cart, shall, moreover, have the following words, common-flags waggon, or cart, as the case may be, under the penalty of a forfeiture not exceeding 5l. nor less than 20l. And no ale-houses shall be kept by toll-collectors at any public bridge, under a penalty of 5l.

It is also enacted by the same statute, that the justices shall inflict their precept to the surveyor, requiring him to erect polls or stones in places where several high-ways meet, with inscriptions on them in large legible letters, containing the names of the towns or chief villages to which the several ways lead; and also in places subject to floods, inscribed with marks denoting the greatest depth of the water: and if he shall neglect or refuse for three months, he shall forfeit 20l. And if any persons remove or destroy polls, blocks, banks, &c. set up for the security of horse and foot.
HIGH-WAY.

sumptuaries, or the battlements of bridges, or destroy, or even deface any mile-stone, or direction-poll, they shall forfeit, on conviction on the oath of one witness, before one justice, or upon view of the justice, a sum not exceeding 5s. nor less than 10s. and on default of payment be committed to the house of correction for any term not exceeding one month, nor less than seven days.

The same statute farther enjoins, that no waggon, the fellows of whose wheels are nine inches broad, shall be driven with more than eight horses, nor carts of the same dimensions with more than five horses; and no waggon, the fellows of whose wheels are six inches broad, and rolling on each side a surface of nine inches, shall be drawn with more than seven horses; and no waggon rolling a surface of six inches only, with more than five horses; nor cart, the breadth of whose wheels is six inches, with more than four horses; nor waggon, the fellows of whose wheels are of less breadth than six inches, shall be drawn with more than five horses, nor cart of the same breadth with more than three horses: the owner that offends against these regulations shall forfeit 5s. and the driver, not being the owner, 10s. for every horse above the proper number, to the use of the informer. But carriages moving upon wheels or rollers, of the breadth of sixteen inches on each side with flat surfaces, shall be allowed to be driven with any number of horses. No regulations affecting the number of horses, and wheels of carriages, shall extend to carriages used in carrying one flone or block of marble, cable rope, piece of metal, or piece of timber, or to such ammunition and artillery as may be required for his majesty's service. For all the purposes of this act two ovens, or horned cattle, shall be considered as one horse.

By the common law, no high-way can be changed without the king's licence first obtained, upon a writ of ad quod damnum. In aid of the common law, and to render the changing of high-ways less troublesome and expensive, power is given by 13 Geo. III. cap. 78, to the justices of the peace to widen, divert, and change high-ways, as they shall judge most convenient. And it is enacted that the surveyor shall make every public cart-way leading to any market town, twenty feet wide at the kail, and every public horse-way or drift-way eight feet wide at the kail, wherever the ground between the fences shall admit of it; or on the view of two justices, it shall be widened or diverted at their pleasure, provided that its breadth exceeds not thirty feet, and that no houses or buildings are pulled down, or any garden, park, court, or yard, taken away; and the owners of the ground, which shall be laid into the high-way, or through which it shall pass, shall be compensated for it, and every injury occasioned. The expenses of making, repairing, &c. high-ways, are defrayed by equal affiements, made by the warrant of a justice, at a special sessions, on all occupiers of lands, tenements, woods, tithe, and hereditaments; provided that no such affisment in one year shall exceed six-pence in the pound. In extraordinary cases another affisment may be made, provided this and the preceding shall not in any one year exceed the rate of nine-pence in the pound.

By the same statute the justices are enjoined to hold a special sessions for the high-ways, in the week next after the Michaelmas general quarter-sessions yearly; and notice shall be given to the countyies of the respective parishes at least ten days before it shall be held. Surveyors of the high-ways are to be chosen yearly, for a life of proper persons, not being the householders, affiements to any parochial or public rate, by the justices at their sessions; and their number shall depend on the extent of the parishes, &c. But no person is liable to be appointed to serve this office within three years from the time of his having served it, without his own consent. Those who refuse to serve, after having been nominated by the parish and justices, shall forfeit 5s. and if they were only nominated by the justices, they shall forfeit 5s. In this case, the justices may appoint a proper person to this office, with a salary not exceeding one eighth part of what shall have been raised by affiement of six-pence in the pound for the use of the high-ways in the district where the affiement hath been raised; and they shall also appoint one substantial inhabitant of such parish, &c., for assistance to such surveyor, till the next annual appointment, whose refusal infects a forfeiture of 5s. And if a second person refuse, he shall also forfeit 5s. and a third shall be appointed, with a salary. Special surveyors returned to the justices by two parts out of three of those who have the choice, with a fixed salary, may be appointed by them with the said salary. In case of the death of a surveyor, two justices at a special sessions may appoint another in his room.

It is the business of the surveyor to preserve high-ways in proper repair, &c. For this purpose it is enacted by the statute (34 Geo. III. c. 74.), that every person keeping a team, draught, or plough, &c., who keeps a waggon, cart, wain, plough, or tumbrel, and three or more horses or beasts of draught, shall fix days in the year, fifteen one wain, cart, or carriage, and other necessaries, and two able men, on the day and place appointed by the surveyor. Those who occupy lands of 50l. a year shall do the same; and in like manner for every 50l. a year respectively. Those who occupy lands under 50l. shall pay to the surveyor, in lieu of the duty, for every 22s. above the annual value of 50l. and less than 100l. Persons keeping a team, but occupying land of the yearly value of 50l. shall be obliged to send only one labourer with such team. Persons not keeping a team, but keeping one or more cart or carts, and one or more horses, shall send one labourer with each cart; and persons keeping a wheel-carriage, but no team, nor occupying 50l. a year, in the parish, township, or place where he resides, shall pay to the surveyor 12s. in respect of every day's statute duty, for every horse which he shall use in such carriage. Every inhabitant eighteen years of age, and upwards, but under sixty, nor chargeable in any other way for 4l. a year, or upwards, and not being an apprentice or member of any particular craft, or having served or compounded in any other place for that year, shall go in person, or send a labourer, at the expense of the owner or occupier, to the surveyor, in the same manner as before stated. Carriages shall be changed, at the discretion of the surveyor, for men, three being allowed for each team, or 5l. 6s. shall be paid in lieu of them. Persons liable to perform statute duty may compound at six-pence rates as the justices shall think fit, not exceeding 6s. nor less than 5s. for each team, for each day, or, in default of their paying the same, the sum of 4s. 6d. for every cart and one horse 22s.; for every cart with two horses 5l. in lieu of each day's duty. And every inhabitant liable to perform that duty, and not chargeable in any other respect, may compound for 4l. each day. The surveyor shall give four days notice to those whose attendance is required, and they shall bring with them their own tools, continue at work for eight hours in each of the appointed days; and defaulters in failing a team, &c., shall forfeit 10s. those in sending a cart with one horse and man, 21s. for not sending a cart with two horses for one man, 5l. and for each labourer 12s. 6d. Surveyors for neglect of duty, where no particular penalty is imposed, shall forfeit a
fam not exceeding 5l. nor less than 10s. at the discretion of the justices. All defects of repairs of high-ways shall be presented in the county where they lie; and the indictment must shew, that they are high-ways; also the places from and to which they lead: where the nuisance was done, and how far it extends; it must likewise state the fact clearly. Justices may present on their own view. For the farther regulations relating to high-ways, the principal of which have been already accounted, the reader is referred to 13 Geo. III. cap. 78.

High-ways, turnpike. See Turnpike.

High-way men are robbers on the high-way; for the apprehending and taking of whom, a reward of 40l. is given by the statute of 4 W. c. 8. to be paid within a month after conviction by the sheriff of the county; to which the statute 8 Geo. II. cap. 16. superadds 10l. to be paid by the hundred indemnified by such taking.

HIGMAM FERRERS, in Geography, a borough, market-town, and parish in the hundred of the same name, in the county of Northampton, England, is a place of considerable note, and is situated on a rocky elevation, abounding with springs, about half a mile from the northern banks of the Nen. Northward of the church, is a space called the Castle-yard, the site of a castle, which is supposed to have been erected by one of the Ferrers's family. But it more probably owes its origin to Thomas, earl of Lancaster, son of Edmund, the younger son of Henry III., who obtained this lordship in the fifteenth year of that monarch's reign. This nobleman, in the fifth of Edward II., was at the head of the affocation, which, under the pretext of supporting public liberty, demanded and obtained the dymsifi of Piels de Gavefon, the royal favourite. The Castle-yard is divided into two parts, by a deep fos, running from east to west. That on the south side contains about two acres: the only remains are hollows, heaps of ruins, and foundations of walls. The northern division, both in extent and strength, appears to have been the most considerable work. It comprises nearly four acres, having on the east side a very large moat, about fifty feet wide, and five hundred long; and another on the south side of similar dimensions. This, it is conjectured, was the site of the castle: and the space to the south, the situation of the advanced and outer works. The church is a quadrangular structure: at the west end of the nave, on a handstone embattled tower, is raised a finely proportioned hexagonal spire; the western front of the tower displays some curious architectural features; at the base is a pointed archway, with two openings for doors beneath it. The church is adorned with sculpture of figures, foliage, &c. On each side of the chancel are ten stalls; one ornamented with a carved head of archbishop Chichele; another with his arms; the rest with various enigmatic devices. In the chancel is an inscription to the memory of the archbishop's parents. This prelate founded a college here in the year 1425, for eight secular canons. The building, now in a ruinous state, was some years since converted into an inn. A portion of the revenues forms the endowment of the present free-school. He also founded and endowed the Alms, or Bead-houfe, for twelve poor men and one woman.

Higham is a borough by preceptive right, and was incorporated in the reign of Philip and Mary. The corporation comprises a mayor, seven aldermen, thirteen capital burgesses, and other inferior officers. The aldermen are chosen out of the burgesses; and the mayor annually elected from the body of aldermen. The mayor has a right of holding a court every three weeks, for determining actions for debt, in any suit under forty pounds. The borough,

by virtue of the same charter, returns one member to parliament; the elective franchise being vested in all the inhabitants not receiving alms. The town is small, consisting of two streets, a lane, and what is here called the market-place, in which stands a cross, bearing a cube at the top, and on the four sides are carved in stone different figures, emblematic of the crucifixion. By the returns under the population act, the number of houses is 125; of inhabitants, 726. From its formerly having had three weekly markets, it was probably then much more populous. Thence kept on Monday and Thursdays have long been disused, and the one held on Saturday is much deserted; though here are still seven well accustomed fairs. The distance from London is 64 miles. Higham is particularly noted as the birth place of Henry Chichele, who was archbishop of Canterbury in the reigns of Henry V. and VI.; of whose love of learning and liberal encouragement for its diffusion, the noble inclusions he founded and endowed are strong and lasting monuments. Bridge's History of Northamptonshire, 2 vols. 4to.

HIGHGATE, a populous hamlet, principally in the parish of Hornsey, and hundred of Offerton, Middlesex, England, occupies, as its name partly implies, a high situation. It is about four miles north of London, and its buildings are irregularly dispersed over a large extent of ground, along the ridge, and down the sloping declivities of a hill. This place is said to derive its name from a gate-house, or gate, that was formerly standing at the top of the hill, and belonged to the bishops of London, who exacted toll from all persons with carriages, horses, cattle, &c. that passed through it. Before this toll-bar was raised and road formed, the road from London to Barnett and northwards, was through Hornsey-park to Colney Hatch, &c., but this being very "myri and deep in winter," as Norden states, it was agreed between the bishop of London and the landholders in this part of the country, that a new road should be formed "through the park, at Highgate Hill," by the former, and that he and his successors should be authorized to collect toll from all passengers. At the time Norden wrote, this toll was farmed for 40l. annually; and in 1701 it was rented at 150l. a year. The gate-house was "taken down in 1799, when the road was opened at the joint expense of the Ilfington and Whetstone trusts," as expressed on a board attached to a tavern built on the site of the old toll-house. Tolls are still demanded for cattle, loaded carriages, and horses for sale. Near the gate-house is the parochial chapel, one of which was erected in 1565, and the other at a later period. It contains two or three monuments with busts, &c., and in it some persons of eminence have been interred. Among whom the following names occur: William Platt, esq., who died in 1637; Lewis Atterbury, Ll. D. obit. 1731; Sir Francis Pemberton, died 1697. Connected with the chapel is a free-school house, which owes its erection to Sir Roger Cholmeley, knight, chief justice of the Queen's Bench in 1562, who also bequeathed a legacy to defray the education of poor boys of Highgate, and to support a master, &c. The school-house occupies the feite of an ancient hermitage. Highgate is noted, among the lower classes of the community, for a linny, burlesque, nugatory eash, which the inhabitants of some of the public-houses occasionally administer to their visitors. A pair of large horns is placed on the head of the peron, and he is required to swear "that he will not eat brown bread when he can get white; will not drink small beer when he can get strong; will not kiss the maid when he can kiss the milkstress," &c. This absurdity was probably invented by a running publican, to attract customers, and his scheme at first gave considerable publicity to the
House and village, but is now seldom employed. Highgate is a great thoroughfare to the northern parts of England and Scotland. Hence a vast number of coaches, waggons, &c. pass through it daily. The hill, from Holloway to the chapel, is long and steep. To avoid this steep, at least four different schemes have been proposed at different periods, but hitherto all that has been effected to obviate the evil, or lessen its force, is a removal of some feet of earth from the summit of the hill, and placing it at the bottom. In the year 1838 a new and novel scheme was proposed by Mr. Robert Varie, an engineer, to form an arched subterraneous tunnel, for a public road, through Highgate-hill, and this plan is now prosecuting with avidity.

Highgate, a township of America, being the north-wellermont except Albany, in Vermont, Franklin county, containing 724 inhabitants.

Highland Creek, a river of America, in Kentucky, which runs into the Ohio, N. lat. 37° 32'. W. long. 83° 22'.

Highland Point, a cape on the N. E. coast of New Zealand, at the entrance of Lowland bay. S. lat. 37° 48'. W. long. 18° 16'.

Highlands, a mountainous tract of country in America, on the banks of Hudson's river, in the state of New York, between 40 and 60 miles N. of New York city. The passage on the river, through these highlands, for the distance of about 18 miles, is very grand and romantic. In these highlands are situated the important fortries of West Point, Fort Montgomery, and Stone Point. These mountains abound with iron ore.

Highlands, a natural division of Scotland, formed by the Grampian mountains, and including the northern and mountainous provinces, and applied to this part of the country in contra-distinction to the "Lowlands," which comprehend the southern districts. The appellation of Highlands is more strictly confined to Argyllshire, the coast of Perthshire, and of Inverness, and the entire counties of Ross, Sutherland, and Caithness, extending also to the Hebrides or Western isles. The whole of this district is wild, rugged, and mountainous, separated by vales, from which the direct rays of the sun are for some months intercepted by the elevated mountain, and into which the rivers flowing from them are precipitated. The three principal rivers, formed by numerous streams and torrents issuing from the hills, are the Tay, the Spey, and the Forth. Before the commencement of the last century, little or no communication subsisted between the Highlands and Lowlands, as they were unconnected by regular roads and bridges, and the entries from the one to the other, were, for the greater part of the year, impassable. In order to facilitate an intercourse between these different parts of the country, general Wade, under a commission from George L., travelled, in 1724, to the most difficult and dangerous pails of the mountains, and projected the bold undertaking of forming spacious roads in these rugged districts. In 1726 he began the work, and by means of five hundred soldiers, employed under proper officers, in the summer season, he completed it in 1737. These roads were two hundred and fifty miles in length, and from twenty to twenty-five yards broad, guarded from the injuries of the rains and torrents to which they were subject, by aqueducts and side-drains. The huge stones raised out of the ground by means of engines, are set up by the road side, to serve as guides in deep snows; and at each interval of five measured miles, pillars are erected, on which the number of miles is inscribed. The roads enter the mountains at three different parts of the low country; one at Crieff, 24 miles N. of Stirling; another at Dunkeld, 12 miles N. of Perth; and the last goes along the side of Loch-Lomond, in Dunbartonshire, by Luss. Since the period in which Gen. Wade finished his operations, the military roads have been further extended, and a ready communication has been opened with every part of the country. Before the period to which we have now referred, the Highlands of Scotland were in a state somewhat similar to that of England before the Norman conquest.

The inhabitants, who were a branch of the ancient Celtiz, probably the first inhabitants of Britain, and who have since been called Caledonians, were divided into tribes, called clans. Those of the inferior order were vassals of particular chiefs, to whom they were attached, and on whom they relied for that safety which the laws could not afford them. On the other hand, the security and confidence of a chieftain depended on the number and fidelity of his servants and retainers; who, on account of their relation to him, affirmed a dignity, and acquired in their manners a degree of politeness, to which other uncivilized nations are strangers. The rents of farms which these vassals occupied were inconsiderable, and were chiefly paid by military service: so the value of a proprietor's land was estimated, not by the money it produced, but by the men whom it could feed into the field; and that the number of dependants might be increased, the farms or allotments of land were small, and barely sufficient for a scanty subsistence to the tenants. As an inconsiderable proportion of the country was cultivated, and as no intercourse subsisted between the inhabitants and any other nation, little time was employed in agriculture and commerce. The greatest part of it was consumed in indolence or amusement, unless when their superior summoned them to avenge on some neighbouring tribe an insult or injury. No more grain was raised, nor was any more rainftn manufactured by any family than that which barely sufficed itself. Villages and hamlets, situated in valleys for shelter, were rudely constructed of turf and stone. In spring the natives ploughed or dug some adjacent patches of soil, in which barley or oats were sown; in summer they prepared and collected turf and peat for fuel; in autumn they gathered in their scanty crops of grain and hay; and the residue of the year was devoted to pastime or predatory excursions. In winter evenings, around a common fire, the youth of both sexes generally assembled for the song, the tale, and the dance. A tale for music was prevalent among them. Their vocal strains were plaintive and melancholy; their instrumen-
try have been handed down from remote ages, and recently moulded into Oral poems, of which we have a specimen in the poems of Ossian. Since the extinction of the order and office of bards, the Gaelic poetic stories and tales are in a great measure lost or adulterated. The language of the Highlanders is still the Gaelic (see GAELIC); and the genius and character of its poetry are well known; being tender, simple, beautiful, and sublime. Strangers, who have ventured to penetrate into the fastnesses of the Highlanders, have been received and treated in the most hospitable manner; but, as for themselves, they seldom wandered, except for the purposes of devilment or plunder. The dref of the country was the kilt, remains of the Roman habit in Europe, well suited to the nature of the country and the necessities of war. It consisted of a light woollen jacket, or tartan, wove in figures of various colours, in which red, green, blue and black are most prevalent. The feil-bag, or kilt, is a short petticoat of the same stuff, reaching to the knees; and the hose, or short stockings, are woven in diamonds of red and white, tied under the knee with garters, often beautifully ornamented: the Highlanders have generally a pouch made of the skin of a badger, fox, or other animal, hanging before, in which they keep their tobacco and money, and this part of their dres is generally adorned with silver buttons and tassels; their plaid is also of tartan, consisting of twelve or thirteen yards of cloth, wrapped round them in a graceful manner, fastened round the middle by a belt, falling to the knees behind, and confined by a broach or silver pin to the top of the left shoulder: this is often their only cover, but with gowns, and when obliged to repose in the field. The trun or trews, which are a sort of tartan pantaloons, are only worn by the gentry, instead of the kilt. Indeed, sir John Sinclair contends, that the trews were the most ancient drefs of the Highlanders, and that the kilt is of comparatively modern introduction. The Highlanders generally affected to have their dres of the colour of the heath on which they repose, probably from a principle of security in time of war, or that they might not be discovered while they lay in the heaths, waiting for their game. Their ancient arms were the broadsword and target, Lochaber axes, (now only used by the town-guard of Edinburgh,) and a dirk (short dagger), to which, before the act for disarming the Highlanders, in 1746, the pilof stuck into the girdle had been added. Always armed with a dirk and pilof, they were ready to repel an assault, or engage in a long conversation as soon as it was given. This circumstance contributed to render them polite and guarded in their behaviour to one another. When embarrassed by their chieftain, they were armed with a broadsword, a dagger, a target, a mufket, and two pilofs. In close engagement, and in broken ranks, they were irresistible. The only foe they dreaded was cavalry. As soon as the battle was over, most of the troops dispersed, and returned home to difpofe of their plunder, and to provide for their families. Their religion was deeply tinctured with superition. They believed in ghosts and apparitions; by appearances in the heavens they predicted future events; they practiced charms and incantations for the cure of various diseases; and to some individuals they thought the divinity had communicated a portion of his preeminence.

The state of Society in the Highlands has been greatly changed and ameliorated since the rebellions in 1715 and 1745. The Roman dres and the use of arms were prohibited by government; roads, as we have already observed, constructed at vast expense, opened an easy communication with the low country; and the courts of barons were suppressed by the jurisdiction act. The heads of clans have now ceased to be petty monarchs; and the services of their val- fals are no longer requisite for their defence or agrandizement. Directed of their legal authority, they now endeavour to preserve their influence by wealth. With this view their attention is directed to the improvement of their estates. Their ancient mode of living is also entirely altered; and the Highland gentleman, in every respect, differs little from a proprietor of the like fortune in the southern country. A spirit of industry has been excited among the tenants, while, in many places, arts and manufactures are encouraged; and the lower classes are, in consequence of the establishment of schools, provided with the means of education.

"The Highlanders (see Eneclyt Br. art. Highlanders), are of a quick and penetrating genius, strongly tinctured with a curiosity or thirst of knowledge, which disposes them to learn any thing very readily. They are active and industrious, where opprobrium does not discourage them by excluding even the hope of thriving. They are remarkably bold and adventurous, which qualifies them for being excellent leamen and soldiers. They are generally of a middle size, rather above it than otherwise: their eyes are bright and lively, their features distinctly marked, and their persons tall and well made. Their countenance is open and ingenuous, and their temper frank and communicative." HIGHLANDERS, in Rural Economy, a term frequently applied to the highland, and some other parts of Scotch cattle.

HIGHMORE, Joseph, in Biography, one among the most successful portrait-painters in England from the time of sir Godfrey Kneller (under whom he is said to have studied, and who particularly noticed him, by distinguishing him as the "Young Lawyer"), till the days of Hudson, and his incomparable pupil Reynolds. He was the third son of Mr. Edward Highmore, a coal-merchant in Thames- street, and nephew of Mr. Highmore, fresquaint-painter to king William, with whom Mr. (afterwards sir John) Thornhill served his apprenticeship. He was born in the parish of St. James, Garlickhithe, June 13th 1692, and was first intended for the law, and articled to an attorney in 1707; but he left it for painting, to which his inclination had always attached him, and was much employed. His leisure hours had been uniformly devoted to the art of designing, and to the study of geometry, perspective, architecture, and anatomy; and he made great proficiency in thefe several branches of knowledge than books. Afterwards, indeed, he had an opportunity of attending the anatomical lectures of Mr. Cef- felden, and he entered himself at the Painter's Academy, in Great Queen-street, where he drew for 10 years. It was in the year 1715, on the expiration of his clerkship, that he commenced the practice of painting as a profession, and settled in the city. In this year Dr. Brook Taylor pub- lished his "Linear Perspective," whose theory our author adopted, and upon which he grounded his subheltent prac- tice; and it has been allowed that few, if any, of the profession were so well acquainted with that excellent, though in some respects intricate, lityem. As his reputation and business increased, he removed from the city to Lime- stone-Fields, in March 1723, where he had an opportunity of introducing himself to the nobility, by engaging with Mr. Pope, the engraver, to make drawings for his prints of the knights of the Bath. In the summer of 1732 he visited the continent; and at Antwerp he had peculiar pleasure in contemplating the works of Rubens, his favourite master. In 1734 he made a similar excursion to Paris, where he had the satisfaction of being feen by cardinal de Polignac, his famous group of antique statues, the court of Lycceum, then just brought from Rome. In 1750 he had the misfor- tone
tune to lose his excellent wife, daughter and heiress of Mr. Anthony Hiller, of Effingham, in Surrey, whom he had married in 1716. On the first institution of the Academy of Painting, Sculpture, Architecture, and the Professors, an honour which, in account of his numerous avocations, he was under a necessity of declining. His principal works were the portraits of the knights of the Bath, on the revival of that order in 1725. In 1754 he published "A critical Examination of those two Paintings (by Rubens) on the ceiling of the banqueting-house at Whitehall, in which Architecture is introduced so far as relates to perspective; together with the discussion of a question which has been the subject of debate among painters," viz. "Whether parallel perspective be at all times just?" Another literary work gained him more applause, viz. "The Practice of Perspective, on the Principles of Dr. Brook Taylor," &c. written many years before, but not published till 1753. In 1765 he published, without his name, "Observations on a Pamphlet, entitled Christianity not founded on Argument." He also published, with his initials, J. H. two small volumes of "Effays, Moral, Religious, and Miscellaneous, with a Translation, in Prose, of Mr. Brown's Latin Poem on the Immortality of the Soul." He also communicated to the public, through the medium of the Gentleman's Magazine, for 1769, "A natural and obvious Manner of contrasting Sun-dials, deduced from the Situation and Motion of the Earth with respect to the Sun;" and in that for 1778, his remarks on colouring figured, by way of a note on the "Epitile to an eminent Painter." Of his numerous portraits, during an extensive practice of 40 years, several of which have been engraved, our limits will not allow us to give a minute detail. Some of the most capital of his performances in the historical branch were "Hagar and Ishmael," a present to the Foundling hospital; "The good Samaritan;" "The finding of Moses;" "The Harlowe Family," as described in Clarissa; "Clarissa;" "The Clementina of Grandison; and the "Queen-mother of Edward IV. with her younger Son, &c. in Westminster Abbey." In 1761 he retired from business, and in 1762 removed to the house of the Rev. Mr. Duncombe, who had married his daughter, at Canterbury, where he passed the remainder of his life, without ever revisiting the metropolis. His mind, however, retained its powers of activity, and he was always usefully as well as agreeably employed. A strong constitution, habitual temperance, and constant attention to his health in youth, as well as age, prolonged his life, and preferred his faculties to his 88th year; and he may be said to have fallen asleep on March 3, 1780. He was interred in the south aisle of Canterbury cathedral, leaving one son, Anthony, educated in his own profession, and a daughter, married to Mr. Duncombe. His talents and character will be repected by all who have a taste for the arts and for principles of religious virtue, exemplified by a corresponding practice. One of his grandsons, Anthony Highmore, esq., is now an eminent solicitor in London, and traces the footsteps of his ancestor by his general conduct.

Highmore, Nathaniel, a physician and anatomist, was born at Fordingbridge, in Hampshire, on the 6th of February 1653. He went to Oxford, where he was elected a scholar of Trinity College in 1652, and took his degree of M.D. in 1652. He settled at Sherborne, in Dorsetshire, where he obtained a considerable share of reputation in the practice of his profession. He died on the 21st of March 1685, at the age of 71, and was buried at Clandon-purces in that county, of which place his father had been rector. Dr. Highmore, though with limited opportunities of instruction, pursued the study of anatomy with zeal, and his name has remained attached to some discoveries not strictly his; as that of the antum minillare, of which he obtained a view from an extracted tooth, which suggested the operation of piercing it from the jaw, practised by Cober. Cafferiis had mentioned the cavity under the name of antum gene. His principal work is, "Corporis humanui Diqstitialis Anatomica," printed at the Hague in 1651, in folio. The defcriptions in this work are too brief, and the reasonings unnecessarily copious; and the figures chiefly copied from Vellusius. His other writings are, "Exercitationes duum, quum prior de passione hysterica, altera de affcciione hypochondriaca," Oxon. 1660. These dissertations abounded with physiological remarks and hypotheses, some of which are ingenious, but were attacked by Dr. Willis. In consequence of this, Highmore printed, in 1675, "De hysterica et hypochondriaca passione, Rejoynon Epiftolaris ad Willium." He likewise published "A History of Generation," 8vo. 1651, which has some good figures of the embryo in the egg, during the state of incubation. Gen. Biog. Elov. Dict. Hist.

HIGHNESS, a quality, or title of honour, gives to princes.

The kings of England and Spain had formerly no other title but that of highness; the first, till the time of Henry VIII. and the second, till that of Charles V. See King.

The petty princes of Italy began first to be complimented with the title of highness in the year 1635. And the duke of Orleans assumed the title of royal highness, in the year 1634, to distinguish himself from the other princes of France.

The duke of Savoy, afterward king of Sardinia, bore the title of royal highness, on account of his pretensions to the kingdom of Cyprus. It is said that the duke only took the title of royal highness, to put himself above the duke of Florence, who was called great duke; but the great duke has since assumed the title of royal highness, to put himself on a level with the duke of Savoy.

The prince of Conti first took the title of most serene highness, leaving that of simple highness to the natural princes.

At present, all the sons of crowned heads are styled royal highness, as the electors of Germany are called electoral highnesses.

HIGHWORTH, in Geography, a market town and parish, in the hundred of the same name, and county of Wilts, England, is situated on a hill, whence its name appears to have been derived. It was formerly called a borough, but at present has no other privileges than the right of electing a mayor and aldermen, who possess some nominal powers. The parish of Highworth consists of about 2200 acres of land, and comprises several chapels and hamlets. The principal of the site is Seven-hampton, a chapel annexed to this vicarage. In this the Warneford family long had a seat; and built for themselves a private oratory, or a monumental chapel, on the south side of Highworth church, wherein there are some pieces of ancient armour. In the same church is a mural tablet to the memory of Sir John Croft, bart. of Dunstan Park, Berks, who died in 1797. Against one of the pillars is a table, containing a long list of charitable donations to the poor. The petty feoffments, for the division of Highworth, are held at this town, and a fixed poylary is preserved in the market place. Here are a small weekly market on Wednesdays, and three annual fairs. About three miles W. of the town, in the tything of Broad-hill, is an ancient encampment, on an eminence called Calle Hill, near which a Roman road from Spinea to Corinium, passed. Two miles southward of Highworth is Cold-hill-houe,
HIL

Hil-houfle, the seat of lord Falkland. The house was built from the designs of Inigo Jones. Highworth contained 234 houses in the year 1801, and 1493 inhabitants. Britton's Beauties of Wiltsire.

HIGLER is a name frequently mentioned in our statutes for a person who carries from door to door, and sells by retail small articles of provisions, &c. They are laid under various restrictions by the statute laws. See Hawkens.

HIGUERA, in Geography, a town in Spain, in Extremadura, 12 miles north of Xeres de los Caballeros.—Alfo, a town of Mexico, in the province of Cñaloa; 28 miles E. of Cñaloa.

HIGUERA, Cape, a cape of Spain, on the coast of Biscay.

N. lat. 45° 22', W. long. 1° 55'.

HIGUEY, or Yiguey, Alto Grecia, a city in the S.E. part of the Spanish division of St. Domingo, the most easterly of all the settlements in that island, celebrated formerly for its fertility, and for the quantity of sugar which it produced. It has now only about 500 inhabitants, and is distant about 40 leagues E. of St. Domingo.

HIIA, a town of Abuhana, 40 miles E. of Azum.

HIIAR, or Ikia, a town of Spain, in Aragon; 25 miles S.H. of Saragossa.

HIII Testibus, g. d. thep. winnefer, in Loar, a phare anciend added in the end of a deed, written in the same hand with the deed; upon which the witnesses were called, the deed read, and then their names entered. See Witness.

The clause of luss testibus, in subject's deeds, continued till, and in, the reign of Henry VIII. but it is now omitted.

Coke on Littleton.

HIKE, in Rural Economy, a term implying to strike with the horn, in the manner cattle often do.

HILARIA, in Antiquity, feasts celebrated every year, by the Romans, on the eighth of the calends of April, or the 25th of March, in honour of Cybele, the mother of the gods: as is observed by Macrobius, lib. i. cap. 15. and Lampridius, in his life of Alexander Severus.

The hilaria were celebrated with great pomp and rejoicing. Every person drest himself as he pleased, and took the marks or badges of whatever dignity or quality he had a fancy for. The statues of the goddesses was carried in procession through the streets of the city, accompanied by multitudes in the most splendid attire. The day before the festival was spent in tears and mourning. Cybele represented the earth, which, at this time of the year, begins to feel the kindly warmth of the spring; so that this sudden transition from sorrow to joy was an emblem of the vicissitudes of the seasons, which succeeded one another.

The Romans took this feast originally from the Greeks, who called it ἠλαρία, q. d. αἰόνιος χορός; the eve of that day they spent in tears and lamentations, and thence denominated it ἀλαριαῖα, δεισφαταί.

Afterwards the Greeks took the name ἱλαρία, from the Romans; as appears from Photius, in his extract of the life of the philosopher 11odore.

Cafbon ton, maintains, that beside this particular signification, the word hilaria was also a general name for any joyful or festival day, whether public, or private and domestic. But Schreber does not allow of this.

Triton, tom. i. p. 482, differentiates between hilaria and hilarities. The former, according to him, were public rejoicings; and the latter, prayers made in consequence thereof; or even of any private feast or rejoicing, as a marriage, &c. The public holidays of old days, during which all mourning and funeral ceremonies were suspended.

HILARION, in Biography, the founder of the monastic life in Palestine, was born at Gaza, in 291, of a pagan family, but quitting the errors of his fathers and embraced Christianity. He distributed all his property among the poor, and withdrew into a desert, where he passed his time in solitude and devotion, and acquired a high character for piety and devotion. The number of his disciples soon became very numerous, whom he distributed into different establishments throughout Palestine and Syria, over which he exercised a most vigilant superintendence. He died in the year 317. at the island of Cyprus.

HILARIUS, Joseph, an eminent antiquary and medallist, was born at En,Laudia, in Lower Austria, in 1737. He was educated among the Jesuits, and afterwards became an eminent teacher of grammar and rhetoric at Vienna, of which college he was appointed praepositus rei mariae.

In the year 1770 he renounced the vows of his order, and in a short time after was appointed professor and director of the Imperial cabinet of ancient coins. He was likewise dean of philosophy and the fine arts. He died in 1798, leaving behind him a high character for extensive knowledge, irreproachable morals, and great wit.

HILARODI, ἤλαρος, compounded of ἢλαρις, joyful, and αὐς, song, in the Ancient Music and Poetry, a sort of poets and the Greeks, who went about singing little merry dirge-like poems or songs; though somewhat graver than the lonic pieces.

The hilarodi appeared drest in white, and were crowned with gold. At first they wore shoes; but afterwards they assumed the crepida, which was only a sole, tied over the foot with tippets.

They did not sing alone, but had always a little boy or girl to attend them, playing on some instrument.

From the streets they were at length introduced into the tragedy, as the magosti were into comedy.

The hilarodi were afterwards called Simodi, from a poet named Simus, who excelled in this kind of poetry.

HILARODIA, a poem, or composition in verse, made or sung by a kind of rhapsodists, called hilarodi.

HILARO-TRAGEDIA, a dramatic performance, partly tragic or ferious, and partly comic or merry.

Scaliger holds, the hilaro-tragœidia and hilarodia to be one and the same thing. Others rather take the hilaro-tragœdia to have been pretty nearly what we call a tragi-comedy. Others, again, will have it to have been a mere tragedy, only terminating with a happy catastrophe, which brings the hero out of a wretched into a fortunate state. But the first opinion seems the most probable, and the best warranted.

Suidas mentions one Rhinthon, a comic poet of Tarentum, as the inventor of this kind of poem; whence it was also called Rhiatonsia fabula.

HILARY, in Biography, was bishop of Poictiers in Aquitaine, and flourished about the year 354. He is placed by Jerome among his illustrious men, from whom we learn that, after his conversion to Christianity from the pagan religion, he became a zealous champion for what was then deemed the orthodox faith against the Arians, labouring to confute them by his writings, and condemning their opinions by the councils which he caused to be assembled at Poictiers. His twelve books on the Trinity, his treatise concerning fyoed addressed to the bishop of the Gauls, and his Commentaries upon the Psalms, the Gospel of St. Matthew, the Book of Job, and the Canticles, are mentioned by Jerome as his principal works. Of these the last and belt edition is that of the Benedictines at Paris, in 1695. Hilary died at Poictiers, in the reign of Valentinian and Valens, about the year 366. In his Prologue to the Commentaries on the Psalms, Hilary gives a catalogue of the books of the Old Testament.
HIL

he appears to have received the Epistle to the Hebrews, though it was not universally received by the Latin Christians, and he often quotes the book of the Revelation, and ascribes it to John the apostle.

HILARY, deacon of Rome, was born in Sardinia, and appointed to his office about the year 354. He is mentioned by Jerome in his account of ecclesiastical writers, who represents him as a zealous Homoiolax, and afterwards a rigid Luciferian; and he pleadsly calls him another Deuel, as if he would bring again an universal delugue on the world, because he was for rebaptizing Arians, and other heretics, when they came over to the church. Differing from other Christians in this particular, he separated from the church, and wrote treatises in favour of his opinion. Cave ascribes to Hilary the "Commentary upon Thirteen of St. Paul's Epistles," usually joined with St. Ambrose's works, which he supposes to have been written before the year 384, and this learned writer considers him also as the author of "Questiones in Vetus et Novum Testamentum," written about 370, and usually joined with St. Augustine's works. Several other writers concur with Cave in ascribing the first work to Hilary, but differ with regard to the latter; and many works are much interpolated by Hilary, and ascribed to the author of the Commentaries, &c. quotes most books of the Old and New Testament. Lardner's Works, vol. iv.

HILARY, a faint in the Roman calendar, born at Arles in 401, of noble and very opulent parents, was distinguished while very young by his proficiency in knowledge and the brilliancy of his talents. Having been persuaded by his relation Honoratus, to devote himself to the religious life, he sold his patrimonial estate, distributed the money arising therefrom among the poor, and entered into a monastery, where he subjected himself to the austerties of the cloister, and applied with diligence to theological studies. He was promoted to the see of Arles in the year 439, which forced him from his cloister into the more active scenes of life. Having entered upon the episcopal duties of his see, he discharged them with uncommon zeal and assiduity, setting before his flock an illustrous example of the virtues which he recommended to their practice. He was an eloquent and impreverse preacher, and freely reproved the vices of the great, without being moved by a dread of their displeasure. He presided in a council at Orleans in 441, and died in 449, at the early age of 40. His works are (1) "Homilies;" (2) "The Life of St. Honoratus;" (3) "An Heroical Poem on the early part of the Book of Genesis;" and "A Short Letter to Eucherius bishop of Lyons," which may be found in the seventh volume of the Bibloth. Patrum. Moret.

HILARIUS, or HILARIUS, pope, was a native of Sardinia, and while he was only a deacon in the church, he was sent, with the character of pope Leo's legate, a later, to assist at the general council summoned to meet at Ephesus, in the year 449, for the purpose of deciding on the questions at issue between Eutyches and Flavians, patriarch of Constantinople. In that council he embraced the interests of Flavians, and protected with great firmness and intrepidity against the sentence of his deposition. His conduct on this occasion led him into difficulties, and withdrawing unexpectedly from Ephesus he travelled by night, and in roads not usually frequented, till he thought he had perfectly escaped the power of Dioscorus, who had preceded at the council. After this he was raised to the archiepiscopal see of the Roman church, and from this station he was elevated, in the year 461, to the papal dignity. No sooner was he ordained, than he devoted his principal care to the exten-

HIL

sion of the power and authority of the Roman see. In the year 462 he held a council at Rome, at which he enacted such decrees as suited his own views, having met with no opposition from the bishops who were assembled at this time. So submissive were the prelates to the edicts of Hilarius, that he had an opportunity of extending his own authority every day, and making them entirely dependent upon him, by favouring the pretensions sometimes of one and sometimes of another. In the year 465, an opportunity offered of acknowledging the bishop of Rome for the successor of St. Peter, "whose primacy ought to be loved and feared by all." Hilary, in the year 467, violently opposed a design of the new emperor Anthemius, to grant leave to the fevral sects of Christians to assemble publicly by themselves, to open openly the doctrines which they held, and to serve God in the manner which they believed most agreeable to him. This noble design was fuggled to the emperor by one of the heretics, who was appointed to the important office of the pope, but whose authority such a measure must ultimately prove fatal, obliged the emperor to relinquish his design, and to take an oath that he would suffer no schismatics to assemble to be held at Rome. Hilary died in the course of the same year, having presided at the head of the church nearly six years. Twelve of his letters may be found in the fourth volume of the "Collect. Concil." Moret.

HILARIUS, or HILARIUS, St. in Geography, the principal town in the island of Jersey, consists of several streets. It is protected from the north winds by high grounds, and is open to the sea on the south-west. Between the town and the hill is a tract of fine meadows, watered by a rivulet which descends from the hills, and passing in different channels through the town, is a pleasant and beneficial appendage to the place. Near the centre of the town is a large quadrangular area, surrounded by respectable houses, among which is the court-house, or seat of justice, called la Coluche Royale. St. Hilary is mostly occupied by merchants, shopkeepers, artificers, and dealers in liquor. For the accommodation of persons attending the market, which is kept every Saturday, there are different buildings and places adapted to their respective pursuits. For the dealers in corn there is a building, supported by pillars, and shambles for the butchers. The parochial church is large and commodious, and the service is alternately performed in French and English. Among the monuments it contains, is one to the memory of major Pearson, who was killed in defending the town in Jan. 6, 1781, when a party of French, under Baron de Ruland, had invaded the island. The garrison and the lieutent-governor had capitulated, but the major, with a few soldiers, rallied, and, though the former lost his life, he was the cause of saving the island; for the French commander was killed and his soldiers taken prisoners. The harbour is protected by a strong castle or fort, the residence of the governor, or lieutent-governor of the island. It occupies the whole of a small island, at the distance of about half a mile from the town, and is accessible by a caufeway as low-water. On the top of a high rocky hill, near the town, was discovered, in the year 1785, a mass of stones ranged in a circular form, some perpendicular, and others lying horizontally on the former. It was called a Druidical temple, and was completely covered with earth at the time of discovery. General Conway, then governor, had the stones removed to Park Place, in Berkshire, where they were again erected and disposed in their original
HIL

original form. The circle is 66 feet in circumference, and
contains of forty-five stones, some of which are seven feet
in height. (See Jersey.) Gough's Camden, and Fall's
Account of Jersey.

HILARY Terni, in Law. See Term.

HILAU, or UAB, in Geography, a town of Peru, in
the diocese of La Paz; 23 S.W. of Chicente.

HILAY, a small island in the Pacific ocean, near the
coast of Peru; S. lat. 16° 50'.

HILBERG, a town of Norway, in the diocese of Dron-}
theim; 11 miles W. of Romidal.

HILBURGHAUSEN, a town of Germany, and cap-
ital of a principality, belonging to a branch of the house
of Saxony, called Saxe-Hilburghausen, separated from
Coburg in the year 1672; the town is leant on the Werra,
and is the usual residence of the duke; 32 miles E. of
Erfurt. N. lat. 50° 15'. E. long. 10°.

HILCONAUR, a town of Hindoostan, in Bednore; 10
miles N.N.E. of Simoguri.

HILDANUS, in Biography. See William Fabricius.

HILDEGARDE, a female saint in the Roman calen-
dar, was born in the county of Spanheim, in the Palat-}
inate, in the year 1068. She was at an early period
devoted to a religious life, and in process of time was
chosen abbess of St. Rupert's Mount, near Bingen, on
the Rhine. Here she acquired a character for a high degree
of sanctity, and assumed the pretensions and powers of a
prophetess, divinely instructed, in dreams and visions, to
announce to mankind the will of God. Her claims were
well adapted to the dark and superstitious age in which she
lived, and occasioned an immense refor to her of credulous
persons of all ranks, who confuted her as an oracle, and
respected her decisions as the commands of the most high
God. Several of the popes, to further their own objects,
pretended to credit her miraculous powers, and were among
the number of her correspondents, as were the archbishops
of Mentz, Cologne, Treves, and other prelates on the contin-}
ent. To all their letters she returned answers in a mys-
tical and prophetic style. She died in the year 1180,
leaving behind her many works which were at the time in
high estimation; of these a part of the following are now to
be met with in the Biblioth. Patrum: "Seleva, fea Ful-}
onum five Revolutionum, lib. iii. 1513; fol. " Vita
S. Roberto Confessoris Binglorum Ducis; " Epitola,
xxxvii.; " Quesiones Variae in Scrip. Sac.; " et Ex-
polito Regna S. Benedetti." Moreni.

HILDESHEIM, in Geography, lately an ecclesiastical
state of Germany and a princely bishopric, bounded on the N.
by the dukedom of Luxemburg, on the E. by the duky of Wolfen-
bütel, and the principality of Halberstadt, on the S. by the
principality of Calenbarg, and on the W. by Calenbarg,
and extending from E. to W. about 40 miles, and 32 from
N. to S. The soil of the greater part of this state is fit
for tillage, and produces corn, flax, hops, and legumes in
abundance; but its breed of cattle, horses, sheep, and
swine is merely sufficient for the consumption of the inhabi-
tants. The south part is hilly, and is for the most part cov-
ered with oak, beech, ash, and birch, and where it is defi-
tive of wood, it has mines of iron. This state contains 12
towns, the chief of which are Hildesheim and Pansa, and
243 villages; its principal rivers are the Leine, Innerfiz,
and Oker. The bishopric was founded by Charlemagne
in 822. The inhabitants are partly Lutherans and partly
Roman Catholics. In 1803 this bishopric was secularized,
and given among the indemnities to the king of Prussia, but
in 1807, after the peace of Tilsit, it was transferred to the
new kingdom of Westphalia.

HILDESHEIM, formerly one of the Hanseatic towns, a city of
Westphalia, to whom sovereign it was surrendered in 1807,
situated near the Innerfiz, is an old-fashioned, large, irregular-
town, divided into the New and Old towns, which were
built in 1523; the inhabitants, are Lutherans; the rest are Roman Catholics, who are in
possession of the cathedral; but the Protestants have eight
churches; 26 miles W.S.W. of Brunswick. N. lat. 52° 12'.
E. long. 10°.

HILDESLEY, Mark, in Biography, an English pre-
late, was born at Markton, in Kent, in 1698, and educated
at the Charter House, from whence he went to Cambridge,
where he was chosen fellow, in the year 1723. Being
admitted into holy orders, he was appointed one of the
preachers at Whitehall, and was afterwards made chaplain
to the lords Bolingbroke and Cobham. In 1731 he obtained
the living of Hitchin in Herefordshire, and shortly after
he was inducted to the living of Holwell in Bedford-
shire, where he distinguished himself as a diligent parish
priest. On the death of Dr. Wilton, bishop of Sodor and
Man, he was appointed his successor, but before his consecra-
tion he was created doctor of divinity by archbishop Herring.
During the period of seventeen years, in which Dr. Hildsley
preached over the diocese of Man, he took every method
in his power to promote the interests of the people over whom
he was placed. He procured an entire translation of the
Old and New Testament to be made into the Manx lan-
guage. This work had been begun by his predecessor
bishop Wilton, who, at his own expense, had printed the
psalms of St. Matthew, and had prepared for the prebend
the other evangelists, and the Acts of the Apostles. Dr. Hilde-
ley was enabled to indulge his own liberal spirit in this design,
as well by the assistance which he received from many persons
of rank and eminence, as by an income which he derived
from the manner of Sherburn hospital, presented to him
by the bishop of Durham, and which he held with the
bishops till his death. The worthy prelate had this work
do so much at heart, that he frequently said, with the feelings
of an humble but anxious mind, "he only wished to see it
finished, and that then he should be happy, die when he
would." On the 28th of November 1772, he received
the last part of the translation, when in the presence of an afec-
tionate and congratulating family, he sung with pious emo-
tion, "Nunc Domine Dimitis!" On the next day he
officiated in his own chapel, and preached with unusual energy
on the uncertainty of human life, and on the following day
he was attacked by a stroke of apoplexy, which soon deprived
him of his intellectual powers, and proved fatal to him in a
very few days, when he was in the seventy-fourth year of his age.

HILEA, or HALE, in Geography, a town of Africa,
in the country of Sugulmea.

HILL, Joseph, in Biography, was born at Bromley, in
Yorkshire, in 1625, and received his college education at
St. John's, Cambridge, after which he became fellow of
Magdalen college, from whence, on account of his noncon-
formity, he was ejected in the year 1662. He died pastor
of a congregation at Rotterdam in 1707. He published an
enlarged edition of Schrevelius's Greek Lexicon, and was
author of "Discussions on the Antiquity of Temples and
Churches."

HILL, Aaron, an English poet, was born in London in
1688, and was left almost wholly unprovided; before he had
attained the age of fourteen, by the death of his father. He
had naturally an adventurous spirit, and at the age of fifteen
took a voyage to Constantinople, where his relation, lord
Parget, was ambassador from the English nation. He was
received.
received with surprize, but treated with great kindness, and a tutor provided for him, under whose care he travelled through Palæstine, Egypt, and various parts of the East. In 1705 he returned to his own country with lord Paget, with whom he has continued with him, but the death of his lordship deprived him of all hopes from that quarter. In due time afterwards he travelled for three years with Mr. W. Wentworth on the tour of Europe. In 1709 he appeared before the public as an author, by "A History of the Ottoman Empire," partly from materials which he collected in that country: in the same year he published a poem in favour of the earl of Peterborough, which introduced him to the favour of that nobleman, and to the notice of the heads of the Tory party. He now became manager of the Drury Lane theatre, for which he wrote his Elfrid, or the Fair Inconstant. Upon some difference with the duke of Kent, who was lord chamberlain, Hill threw up his theatrical management, which he had conducted entirely to the satisfaction of the public. He was a man of warm feelings, and a good deal given to projects. He obtained a patent for extracting oil out of beech mast, and a company of subscribers was formed for the purpose of carrying the undertaking into effect. The trial was fairly made, but experience shewed the folly of the scheme, and after three years it was abandoned. He became master of the Opera house, and wrote for it the opera of Rinaldo, the first which Handel composed in England. About the year 1718, he published a poem, entitled the Northern Star, or a panegyric on Peter the Great, for which the empress Catherine sent him a gold medal. He died in February 1750, in his sixty-eighth year, and was interred in the cloisters of Westminster Abbey. His character has been given by one of his biographers in a few words: "He was a great schemer as well as a poet, but as in the former character he never acquired riches, so in the latter he never rose above mediocrity." His works were published in four volumes 8vo. after his death. He was a man of active and extensive benevolence: he was kind and affectionate in all the relations of society, and few men have been more beloved. Of his various plays, two of them, viz. Zara and Meropen, are still occasionally brought forward with applause; but a dramatic writer and poet cannot claim a high rank, whose best pieces are translatons.

Hill, in Geography, a hill of eminence or elevation on the surface of the earth, with respect to height and extent, than a mountain; which see.

To find the height of a hill, see the latter part of the article Leveling.

On the structure of hills it may be proper to observe, that the far greater part of the hills on the surface of the earth are occasioned by the excavation of an adjacent valley, (see that article,) and such hills have the edges of the strata composing them only visible towards or in the flanks of such valleys; another class of hills, and which frequently form ridges of considerable length, is occasioned by the out-crop, boulder, or ending of rocks and other thick and hard strata, (see that article,) and such hills only exhibit the edges of their strata on one side, which is more commonly their W. or N.W. side than any other, and which Mr. A. Aikin calls their escarpment, facing of which there usually is a plane or comparatively flat country: to the hills of this class are to be referred the edges of denuded tracts, like those of chalk which surround the woods of Suffolk, Kent, and Surrey, the grit-slopes which surround the valley of the Haver, or the central lime-hill of brick in Derbyshire, the red marle which surrounds the Ashby-de-la-Zouch coal-field in Derbyshire and Leicestershire, the first grit rock which, like a lengthened horse-shoe, surrounds three sides of the great internal lime-rose tract of Derbyshire and Staffordshire, &c.; it being extremely rare, that faults or vertical demergements, or what M. De Luc calls angular motions of the strata, has occasioned hills or cliffs. A third class of hills has recently been denominated Hummocks by Dr. W. Richardson, (see that article,) and these are composed of junks of pebbles, &c., left in the area of a surrounding denudation, or abruption, just as labourers leave dead-men or bines in removing tracts of ground, in order for their matters to see and thereby measure the quantity of earth which has been removed: these various hills are not peculiar to the isolated knowles of low tracts, but after the hummocks of strata which have been removed for miles all around, form the highest points in the district. In the hill of hills with the top stratum, at least, has its edges on all sides exposed, as otherwise it would belong to one of the former classes, though frequently more edges of strata are to be seen on one side than on the other, particularly if the strata in the hummock have a considerable dip or inclination, and such are called by Mr. Jameson hill-formed strata. (Geognofy, vol. iii. p. 64.) Gravel or other alluvial matters are often heaped upon hills, so as to form caps or hummocks thereon; and sometimes, though very rarely, hills may be found composed wholly of heaps or hummocks of gravel or alluvia. It remains to mention only one other class of hills, which are composed of unstratifed masses, like those of Charnwood forest in Leicestershire, and numerous other anomalous masses or nodules in the red-earth or marle of England, the limestone-flake and others of the British series of strata, and of other parts of the world. On the height of British hills, we must refer to the ample lists given in Mr. Jameson's Geognofy, vol. iii. pages 313 to 322; and for the strata which are found on the top of each of about 700 hills in Derbyshire and the adjoining counties, to Fairey's Derbyshire Report, vol. i. p. 16.

Hill, in Geography, a town of America, in Virginia, on the Rappahannock; 17 miles N.N.W. of Urbanna. Hill's Bay, a bay in Chesapeake bay. N. lat. 37° 32'. W. long. 76° 20'.

Hill Creek, a river of America, which runs into the Ohio, N. lat. 38° 57'. W. long. 84° 45'.—Allo, a river of Maryland, which runs into the Potomack, N. lat. 39° 49'. W. long. 78° 23'.

Hill and Trough, in Mining, are used to denote strata which alternately rise and fall in parallel lines, similar to the surface of ridges and furrows in some ploughed fields, hence called ridge and furrow, or ridge and furrow, by the colliers, where the floor of their coals assume this shape, which sometimes, though rarely, is the cause. The floor of the fuller's earth, at Hogfyned, in Wavendon, Bucks, near Woburn, lies in ridge and furrow. The cause of these and other deviations from planes in the strata, undisturbed by faults, is deserving of great attention from geological observers.

HILLARY, in Geography, a town of Sweden, in the province of Smalnad; 42 miles S.W. of Wexio.

HILLEBECK, a town of Norway, in the diocese of Aggerhus; 13 miles S.W. of Christiania.

HILLEBRUN, a town of Sweden, in the province of Gefricia; eight miles N. of Gefile.

Hilleburg, a town of Hindooftan, in Bednore; 40 miles S.E. of Simbrobin.

Hillel, called Pallo by Josephus, in Biography, was one of the most eminent men that ever existed among the Jewish doctors, for birth, learning, authority, and piety. As to his birth, he was by his mother the seed of David; with
with regard to his learning in the Jewish law and traditions, the Jewish writers, by an unanimous suffrage, align him the first rank among all the ancient doctors of their nation: as to authority, he occupied the highest station of honour among his people during a succession of 40 years: for so long he filled the chair of president of the Sanhedrim at Jerusalem, with singular reputation and honour, rivalling in wisdom and justice his remote predecessor Simon the Just: and with respect to his posterity, he was succeeded in his high office, as well as in his learning and general celebrity, by his lineal descendants to the tenth generation. His immediate successor was his son Simeon, who is supposed to have been the same who took Ciriela in his arms, on his being first presented for election: and sang over him "Nunc dimittis." (Luke, ii.) After Simeon succeeded Gamaliel his son, who presided in the Sanhedrim, when Peter and the apostles were called before that council (Acts, v. 34.), and was the same at whose feet Paul was bred up in the feet and learning of the Pharisees (Acts, xxix. 3.) He was succeeded by his son Simeon, who perished in the destruction of Jerusalem. At a further distance in this line of descent was R. Judah Hakkadon, who is said to have composed the Mishna, and whose name on that account has been held in high estimation among the Jewish people. In the progression of this descent was Hillel the second, who was the compiler of the present calendar of the Jews. Hillel, as we have said, was succeeded on the side of his family by David, but by his father he was of the tribe of Benjamin. He was born in Babylonia, and at the age of 40 years he came to Jerusalem, where he devoted himself to the study of the law, and attained to such excellence, that after 40 years he became president of the Sanhedrim, being then 80 years old, and continued in that office for 40 years, so that according to this account he lived 120 years. He was the founder of a famous school at Jerusalem, in which he educated above a thousand scholars in the knowledge of the law. Among his disciples, Shammai was the most celebrated, and came nearest to his master in learning of all the Mishnaical doctors: and accordingly he was appointed vice-president of the Sanhedrim. When Herod took possession of Jerusalem, in the first year of his reign, (A.D. 27.) he put to death all the counsellors of the great Sanhedrin, except Pollio and Sames, i.e., Hillel and Shammai. When the latter became vice-president of the former, he did not always concur in opinion with his master. There were many points in which they differed; and this difference produced divisions and quarrels among their followers, so that two parties subdivided among the Pharisees of that period; and the contention proceeded so far, that several were slain on both sides. At length, however, the school of Hillel prevailed against that of Shammai; the determination, as it is said, having been given for the former by a "Eath Kol," that is, by a voice pretended to have come from heaven, and by this fiction all disturbances among them were appeased. Hillel was of a mild and peaceable temper, but Shammai was a violent person: and hence proceeded most of the disputes and conflicts that occurred between the schools of the two great doctors, of which Shammai being at length weary, consented to terminate them by the fiction we have now mentioned. Prid. Conn. vol. iv.

HILLER, Matthew, a learned German divine of the Lutheran persuasion, was born at Stuttgart in the year 1626. He finished his studies at Tubingen, where he took the degree of M. A. in 1669. He obtained some church preferment, and was professor of logic and metaphysics at Tubingen, and in 1692 he was appointed to the Hebrew professorship. After this he was created profeßor in ordinary of the Greek and oriental languages. He died in 1745, at the age of 79 years. He was author of "Sciagraphia Grammatica, Hebraica," and various other works.

HILLER, an ingenious and popular composer of comic operas at Leipzic, in the German language, the airs in which were in general favour among the lovers of simplicity and unlearned music, 30 years ago.

This worthy professor is a candid critic and biographer, and has been the careful editor of innumerable curious ancient and modern musical productions.

HILLEROD, in Geography, a town of Denmark, in the island of Zealand; burnt down in 1725, and rebuilt in the following year; 13 miles N. W. of Copenhagen.

Gen. Ch. Cal. Perrinath superior, of six oblong, acute, erect leaves. Cor. of one petal; tube cylindrical, forked, very long; limb in six oblong, flat, deep segments. Stam. Filaments fix, very short; anthers oblong, erect, within the throat of the corolla. Pet. Germen inferior, oblong, imperfectly hexagonal; file thread-shaped, the length of the tube; flowering very early. Captail oblong, compressed, of two cells. Seeds numerous, very small, pappose, affixed to the linear receptacle.

Eff. Ch. Calyx superior, of six leaves. Corolla fix-scut, very long. Berry inferior, with two cells and many seeds. Obs. Six little leaves stand under the germin, (within the two larger bracteas,) which Swartz considers as an inferior calyx, but this appears to us fo paradoxical that we prefer calling them bracteas.

1. H. longiflora. Swartz. Prod. 58. Curt. Bot. Mag. t. 721. Andr. Bot. Rep. t. 145. (H. parasitica; Linn. Sp. Pl. 1662.)—"Corolla of six lanceolate, revolute segments. Leaves ovate, acute." A native of moist shrubby places on the mountains of Jamaica, flowering in the summer. The plant is not strictly parasitical, though its roots creep amongst the mossy trunks and branches of old trees. Indeed the name parasitica has been supposed to have been bestowed on this plant in allusion to the literary character of the author, after whom the genus is named. It is a shrub about a fathom high, branching and smooth, with a flaming, cinereous bark. Leaves opposite, spreading, entire, fearfully nerveous, without veins; standing on round, smooth, footstalks. Flowers terminal, sessile, solitary, very long, white, and extremely fragrant; outer bracteas two, very large, tube of the corolla three or four inches long; anthers white. Stigma biftid, dark green.

2. H. tetrandra. Swartz. Prod. 58. Ind. Occ. v. t. 630.—"Corolla of four ovate segments. Stamens four. Leaves ovate."—Habitat the same as that of the last species. It flowers in August.—A shrub, three or four feet high. Roots creeping, and throwing out long fibres. Stem loosely branched, smooth. Leaves opposite, wedge-shaped at the base, somewhat reflex, of a bright green. Flowers terminal and axillary, sessile, solitary, yellowish-white.

These are the only two species known to us, and indeed the latter is adopted entirely on the authority of Swartz.

HILLIARD, Nicholas, in Biography, a portrait-painter, who studied and imitated the works of Hans Holbein. He was the son of Nicholas Hilliard, a tradesman at Exeter, and was born in that city in 1547. He had the honour of painting the two rival queens, Elizabeth and Mary, queen of Scotland. He never obtained the politdy...
and truth of Holbein in his works; his colour is weaker, and his drawing not so free nor true; yet he wrought with great neatness, enriched his pictures with pearls and jewels, touched with great delicacy and spirit; and the hair and beards of his portraits are painted in fine lines, and not, like Holbein's, soft and broad. He was very much employed by the nobility and gentry, and was admired and highly prized in his time. Enjoying his reputation to the age of 72, he died in 1619.

HILLICENHAVEN, in Geography, a town of the duchy of Holstein, situated on the Baltic; 37 miles N. of Lubeck.

HILLOCk, a name often applied to a small fort of hill, as well as to little ridges occasionally met with in fud¬land, that are caused by ants and other animals. See Mount.

Hillocks, are the conical heaps of rubbith drawn from the lead-mines, and which usually surround the tops of the shafts; the following mines in Derbyshire have prodigious large hillocks of freagh, or white vein-rufl, &c. Bondo¬hole, in Middleton, by Wirkworth; Gang, in Cromford; Gregory, in Overton; Hill-top, in Middleton, by W. Hucklow-edge, in Great Hucklow; Mosf-rake, in Brad¬well; Samuel, on Middleton moor, near Wirkworth, &e.; see Mr. Farow's list of mines, in his Report on Derbyshire, vol. i. The refuse of mines, or hillock-rufl, postous fossils kept on or near it, by the small particles of lead-ore which they pick up along with their food.

Hillocky, a term signifying full of ant-hills.

Hills, Lake of the, in Geography, a lake of North America, N. lat. 58° 50', into which the Elk river discharges itself. See Athenaas and Chepewyan.

Hillsborough, a market and post-town in the county of Down, province of Ulter, Ireland. It is a well built and thriving town, the property of the marquis of Downshire, who has a house in it. There is a magnificent church, built by the late earl of Hillsborough, grand-father of the present marquis, to whose exertions the town was much indebted for its flourishing state. It was formerly a borough which returned two members to parliament; but, like many others, lost its privilege on the Union. The magistrats are a sovereign and deputy sovereign, and the mar¬quis of Downshire, who takes from it his title of earl, is hereditary confable of the fort. Hillsborough is 601 miles N. by E. from Dublin, and 20 miles S.W. from Belfast. N. 'a. 54° 26'. W. long. 6°.

Hillsborough, an island on the Labrador coast, on a bay at the head of which is Nain. N. lat. 57° 20'. W. long. 61° 20'.—Alfo, a county of America, in New Hampshire, bounded N. by Grafton county, S. by the lake of Man¬chaulets, W. by Cleghire, and E. by Rockingham county; and containing 43,699 inhabitants, whose chief employment is agriculture. The chief towns are Amherst and Hopkin¬ton.—Alfo, a post-town in the before-named county, situated on the northern head branches ot Contecook river, about eighteen or twenty miles W. of Concord; incorporated in 1772, and containing 1311 inhabitants.—Alfo, a township in Somerset county, New Jersey, which contained, in 1795, 2201 inhabitants; 15 miles W. of Brunswick.—Alfo, one of the middle districts of North Carolina, bounded N. by the county of Virginia, S. by Fayetteville district, E. by Half¬fack, and W. by Salisbury; and comprehending the coun¬ties of Granville, Perion, Cadwell, Orange, Wake, Chat¬ham, and Randolph. It contains 80,012 inhabitants, of whom 22,108 are slaves. The chief town is Hillsborough.

—Alfo, the town last-mentioned, capital of the district of its name, situated in Orange county, on the N. side of Eno river, in an elevated, fertile, and healthy country, and containing about 80 houses, a court-house, a gaol, and an aca¬demy; 180 miles W.N.W. of Newbern, and 452 S.W. by S. of Philadelphia.—Alfo, a post-town in Lounford county, Virginia; 33 miles from Washingfom.—Alfo, a river of East Florida, which runs into the gulf of Florida, N. lat. 27° 36'. W. long. 81° 20'.—Alfo, another river of East Florida, which runs into the gulf of Mexico, N. lat. 28° 10'. W. long. 82° 30'.

Hillsborough Bay, a bay on the N. coast of the island of Dominica, formed at the mouth of a river of the same name. N. lat. 15° 42'. W. long. 62° 24'.—Alfo, a bay on the S. coast of the island of St. John, in the gulf of St. Lawrence. N. lat. 45° 10'. W. long. 62° 40'.

Hillsborough Cape, a cape on the N.E. coast of New Holland. S. lat. 25° 56'. E. long. 148° 44'.

Hillsdale, a post-town in Columbia county, New York, containing 4702 inhabitants; 15 miles E. of Hudson city.

Hilltown, or Hilton, a small town near the cen¬tre of Chester county, Pennsylvania; 28 miles W. of Phila¬delphia.—Alfo, a township of Bucks county, in the same state, having 1154 inhabitants.

Hilly Land, in Agriculture, that description of ground which is much raised into hills. This sort of land requires much care and attention in its cultivation, especially in the ploughing, fowling, and working of the more elevated parts.

See Husbandry, Fowling, and Tillage.

Hilo, in Geography, a river of Chinese Tartary, which runs into the sea of Japan, N. lat. 42° 54'. E. long. 134° 31'.

Hilongos, a town on the W. coast of the island of Leyte. N. lat. 10° 25'. E. long. 124° 40'.

Hilpoldstein, a town of Germany, in the territo¬ry of Nuremberg; 17 miles N.E. of Nuremberg.—Alfo, a town of Bavaria, in the principality of Neuburg; 27 miles N. of Neuburg.

Hilla, a town of Hindooflan, in Bahar; 17 miles W. of Bahar. N. lat. 25° 18'. E. long. 85° 28'.

Hillsbach, a town of Germany, in the palatinate of the Rhine; 20 miles E. of Spire.

Hillers, a town of Germany, in the bishopric of Fulda; 14 miles E. of Fulda.

Hilton, John, in Biography, an English musician and publisher of music during the reigns of queen Elizabeth, James, and Charles I.; who, though he furnished a madrigal in the "Triumph of Oriana," 1621, is found active as a composer and editor fifty years after.

He was a bachelor in music of the University of Cam¬bridge, organist of St. Margaret's Westminster, and also clerk of that parish. Though he began to flourish in the latter end of queen Elizabeth's reign, his genius for composition did not much expand, at least publicly, during the next reign; though early in that of Charles I., he published "A Fair" for three voices, and in 1632, an excellent collec¬tion of catches, rounds, and canons, for three and four voices, under the quaint title of "Catch that catch can!" among which there are many by himself, that were deferentially admired by his contemporaries, and which still afford great pleasure to the lovers of this species of ornamental and co¬vivial evocations. He died during the Protectorship, and was buried
buried in the cloister of Weidminister Abbey. He is said to have had an anthem sung in that church, before his body was brought out for interment; but as not only the clerical service was suppressed during this period, but the liturgy itself and every species of choral music, the fact seems unlikely and ill-founded.

Hilton Head, in Geography, an island of S. Carolina; W. and S.W., of which lie Pickney’s, Balls, Dawson’s, and some smaller islands; and between these and Hilton Head are Callabogue river and found, which form the outlet of May and New rivers.

Hilton’s Point, lies in Piscataqua river, New Hampshire, and is the spot where the united streams of Newchawanock and Cocheco rivers meet the western branch, and form the Piscataqua. The course of the river, from thence to the sea, being about seven miles, is so rapid, that the water never freezes.

HILUM, in Botany, the Sear or Eye, is that particular part of the seed attached to the seed-veil, through which nourishment passes for the support of the internal parts. It is extremely visible in the bean, and as all the vessels belonging to the seed are found to meet in this point, and to divercate from it, they must be intimately connected with the inner surface of the bilum. This point is often strongly cleft or split in colour with the rest of the seed, as is the case in Cardiogpernum, Doliocarp, &c. In describing the form or various external portions of any seed, the bilum is always to be considered as the base. When the seed is quite ripe, the communication through this channel is interrupted: it separates from the parent plant without injury; a scar being formed on each. Yet the bilum is so far capable of retaining its former nature, that the juices of the earth are imbibed through it previous to germination.”

HIMANGO, in Geography, a town of Sweden, in the province of Vasa; 25 miles N.E. of Gamla Karleby.

HIMANTIA, in Botany, from Ιμαντια, a strong, or rough. Per. syn. 703. - Cryptogamia Fungi. Nat. Ord. Fungi, Eff. Ch. Creeping, villous, branched and fibrous. 1. H. damascena. - Very large, brownish, inclining to violet, soft, coating into a membranous substance. This peculiar fungus is found occasionally in houses, infesting itself, sometimes to the extent of an ell, among wrought wood, which it defrays.

3. H. candida. - Parasitic on leaves, tender white, dilated like feathers at the top. - This is the Rvsia candida of Hudson, p. 607; B. tenerrima villana et elegantissime rana-lora; Dill. Muf. 71. 9. f. 15. A; frequent among decayed leaves, as those of Hawthorn, in mossy dells in winter. It much resembles Mr. Dillwyn’s Confere riva, syn. n. 39. C. - Per. synonce mentions a larger and more unconnected variety, found on dry branches.

4. H. lateritia. (Clavaria filiformis; Bulliard, t. 448.) - Wavy, somewhat branched, unconnected, red-brown; its fumunits swelling, whitish. - Found in France, on half-rotten leaves. It is described by Bulliard as sometimes brown, sometimes greyish-brown, but mostly of a brick colour.

5. H. umbra. - Fibrous, tender, villous, dark brown. - Found rarely on dry fir wood. - Distinguishes from Rhizomorpha corticalis

6. H. farinacea. - Red brown, dry, with a whitish powder; its fibres depressed. - Found on wood and branches of trees. Ludwigus.

HIMANTOPUS, Long-legged Pluvor, in Ornithology. See CHARADRIUS Himantopus.

HIMANTOSIS, in Surgery, a relaxation and lengthening of the tendons, which hangs down like a thong of leather, from which the word is deduced, having this latter signification.

HIMAS, the name as Himantofis.

HIMAUS, or Imaus, in Geography. See Himaleh.

HIMERA, in Ancient Geography, a town of Sicily. W. of Cenchrae, at the mouth of a river of the same name, now called Salso. It is said to have been founded by a colony of Zancians, about the year of Rome 144. It was destroyed by the Carthaginians under Hamilcar, who took the place by assault, razed it to its foundation, and treated the inhabitants with great cruelty, in the year of Rome 350. Near this city were baths, called “Himerae Termas.”—Alfo, a town of Libya.

HIMELA, L. A. in Geography, a town of Spain, in the province of Jaen; 12 miles E. of Ubeda.

HIMMALEH, anciently called Emodus, Himas, or Imaus, a range of mountains in Asia, extending from the Ganges, above Sirimagur, to Cashmere, and separating Cashmere and the dependencies of Hindoo-Koosh from Great Thibet, and Cashgar from Little Thibet. Himmaleh is a Sanscrit word, which signifies ’snowy’; and the ancient appellations were probably derived from this term, to which Pliny seems to refer, when he says, “Imas, incolatur lingua nivium significat.” This range of mountains appears to incline, in its northern course, towards the continuation of Hindoo-Koosh, and even to join it. Here then, we are to imagine, an extensive tract, of a triangular form, whose base of 250 miles or more, is a line drawn from Cashmere to the eastern confines of Anderab; and whose sides are the continuation of Himmaleh on the E., and that of Hindoo-Koosh on the W. This space contains, amongst other countries, those of Little Thibet (or Balti-Plan), and Sakita; the Byhe and Sace of the Ptolemies; and also Kutkure, which answers to the Comedia of the same geographer; it also contains the sources of the Indus. From the descriptions of Little Thibet and Kutkure (which see) we may conclude, that this whole space is mountains, and that its general level is far elevated above the countries on either side of it. We have no particular information, says major Rennell, respecting the position of the range of mountains which forms the base, or southern side of the triangle; but circumstances lead us to conclude, that the highest of these mountains are far removed from the northern frontier of the provinces, subject to, or commonly regarded as a part of Hindoo-Koosh; and that the mountains which properly constitute the boundary of Hindoo-Koosh, towards Kutkure (or Canerilan), commence in the parallel of Cashmere, or about 34 degrees; and extending westward from that celebrated country, separate Puckhool, Sewad, and Bijdore on the south, from Canerilan on the north; and advancing from thence to a junction with mount Hindoo-Koosh, in the line between Cabul and Anderab, separate Lunghian, which appears to have been the ancient frontier of Cabul, from those districts, which, after the time of Baber, were added to, and have since become a part of the province of Cabul; according to its defined limits in the Ayin-Acbaree. On the north of this range, the whole country may be regarded as mountainous; on the south the mountainous tract is confined chiefly to Sewad, Bijdore, and a part of Puckhool. (Rennell's Mem.) By Col. Crawford's observations, a peak of
of Himmaleh, seen from Patna, exceeds 20,000 feet above Nepal, which is probably 5000 feet above the sea. HimmUTNAGUR; a town of Bengal; 25 miles N.E. of Porneah. HIMIS, a town of Arabia, in the province of Lachfa, near the Persian gulf; 50 miles N. of Lachfa. HIMTABADS, a town of Bengal; 25 miles W. of Dimagepore. HIM TCHAN, a town of China, of the third rank, in Pe-teche-li; 50 miles S.W. of Pao-ting. HIN, a Hebrew mafeure, containing the sixth part of an epha; or one wine gallon and two pints. HIN, in Geography, a city of China, of the second rank, in Chem-n. N. lat. 38° 27'; E. long. 112° 22'. HINA, a town of Mexico, in the province of Yucatan; 12 miles N. of Campeachy. HINAGIE ISLANDS, three or four islands in the Indian sea, near the coast of Africa. S. lat. 6° 30'. HINATOA, a town on the E. coast of the island of Mindanao. N. lat. 8° 12'. E. long. 126° 18'. HINCHA, or St. Jean de Goava, a town in the island of Hilfamia. N. lat. 19° 14'. W. long. 72° 45'. HIN CHANG, a town of China, of the third rank, in Kiang-nan; 25 miles W.N.W. of Cheou. HINCHIN BROKE, CAPE, a cape so called by capt. Cook, on the W. coast of North America, at the entrance into Prince William's found; within which is an anchoring place, in eight fathoms water, with a clayey bottom, at about a quarter of a mile from the shore. N. lat. 60° 15'. E. long. 213'. HINCHIN BROOK ISLAND, one of the New Hebrides in the Southern Pacific ocean, a little to the north of Sandwich island; about six miles in circumference.—Also, an island in the S.E. part of Prince William's found, near the W. coast of North America. Its form is triangular; it has a large bay on its N. coast, and is above 28 miles in circumference. N. lat. 60° 24'. E. long. 213° 50' to 114° 24'. HINCKLEY, a market town and parish in the hundred of Sparkenhoe, Leicestershire, England, is situated near the borders of Warwickshire. Soon after the conquering it was created a barony, and held by Hugh de Grenteimalfin, who erected a flately castle and a parish church within this domain. “The ruins of the castle,” says Leland, “now long lying to the king, the same time to the earl of Leycester, be a five miles from Leycester, and in the borders of Leycester forest, and the bounds of the bishopric be famous and famous there.” Even the earth-works of the castle are now nearly levelled. The ditch and town-wall may however be traced in many places, and also the vestiges of what are called two Roman works: a mount near the river, and the ruins of a bath adjoining the church. A priory was founded here, according to Tanner, by Robert Blanchmaine, and according to Dugdale, by Boffin, the father of Robert; but Mr. Nichols controverts both these claims, and ascribes it to Hugh de Grenteimalfin, who gave the priory, with the approbation of the priory church to the abbey of Lira in Normandy. This priory, like all foreign cells, was often feigned by the crown during the wars with France, and was wholly suppressed by Henry V. The priory of Hinckley is of very great extent, and includes Stoke-Golding, Daddington, Wyken, and The Hyde, which, though distant villages, (the latter being in the county of Warwick,) are considered as hamlets of Hinckley. The town, under its original lords, certainly enjoyed the privileges of a borough; but being connected with the house of Luceaster, and taking a decided part on that side in the civil contest; those privileges, whatever their extent might be, became forfeited to the conquering monarch of the house of York. The town is now divided into the borough, and the bond without. The limits of the former were anciently thofe of the town; which has been extended by the succedive addition of four freects. The civil government is vested in the mayor, consil-
HIN

HIN

rimade or pickle, and moistened while it is roasting. See

Hunting.

HIND Hand, in the Mange. See HAND.

HINDAK, in Geograph., a town of Asiatic Turkey, in
Natalia: 25 miles S. W. of Boli.

HINDELOOPEN, a sea-port town of Holland, in the
department of Friesland, situated on the Zuider-see. It
has no walls, and its harbour is small. It is governed by
five burgomasters, and six exchequers. The inhabitants are
chiefly employed in fishing, and building small vessels; 21
miles S. W. of Leuwarden. N. lat. 51° 18'. E. long. 5°
23'.

HINDENI Homines, formed from the Saxon hindene,
a society or company, anciently signified a society, or chiefts of
men.

In the time of our Saxon ancestors, all men were ranked
into three classes: or hindenes; the lowest, the middle, and
the highest; and they were valued according to the clasys they
were in; that in case an injury were done by any one, sati-
faction might be made according to the value worth of the
man it was done to.

The lowest were those who were worth ten pounds, or two
hundred shillings; called cirri ducentini, or svecynhunden, and
their wives, scyndyndas.

The middle were valued at fix hundred shillings; and were
called svecynhunden, and their wives svecynsas.

The highest were valued at twelve hundred shillings; and
were called rauyhunden, and their wives the rauhyndus.

HINDENY, or ENRE, in Geography, a river of Hind-
doostan, which passes by Adoni, and betwixt Bifmgur and
the Kithnah, falls into the Toombuddra.

HINDERAA, a town of Norway, in the diocese of
Christiansland; 10 miles N. of Stavanger.

HINDERABI, or ANDARVIA, an island in the Per-
fian gulf, about three or four miles long, and one broad, se-
parated from the coast of Persia by a channel half a league
across, with depth of water from seven to fifteen fathoms, and
a muddy bottom. N. lat. 26° 44'. E. long. 54°.

HINDERSOE, a small island in the N. part of the gulf
of Bothnia. N. lat. 65° 38'. E. long. 20° 24'.

HINDIA, a circuit of Hindooistan, in Candideh, bounded
N. by Bupal, E. by Kerleh, S. by the Taptee river, and
W. by Bapour. Its chief towns are Hindia, Hurdah, Hustingabad,
and Barawany.—Also, the capital of the fore-
mentioned circuit, situated on the Nerbudda; six miles N. of
the town. N. lat. 22° 35'. E. long. 77° 10'.

HINDWIN, or HINGYIN, a large island on the Per-
fian, in the province of Segiistan, which lies from two widely
separated sources, one in the mountains of Gaur, a part of the
Hindoos-Kho, and the other far to the south from the
mountains of Gabelabad. These streams join not far to the
E. of Bod, whence the river pursues a westerly course, and,
according to the account of Otter, very soon divides into
many branches, which are lost in the central deserts of Per-
fia. Our geographers, on the contrary, suppose that the
Hindwim pursues its course by Zerang into the sea of Zerch. Pinker-
ton.

HIDNOE, an island in the North sea, near the coast of
Norway, about 150 miles in circumference. N. lat. 68°
35'.

HINDON, a market-town and borough in the county of
Wilts, England, noted in the annals of parliamentary his-
tory, and borough intrigues, for the contested elections that
have occurred here. It is deemed an open borough, and
the right of election vested in the bailiff and all the inhab-
ants paying rent and lot; the number of which amounts to
about 210. A notable scene of bribery and corruption,
respecting this borough, was developed before a committee
of the house of commons in 1775, when it was determined,
that out of four candidates, neither of them was duly elect-
ed a burgess, and that the speaker should not give his warrant
for their election without. The number of candidates was so
great, that it would be expedient to dis-franchise the said borough.
A bill was brought into parliament for this purpose, but was
thrown out on account of some items of informality. A
new bill was afterwards prepared, and read twice during the
sessions of 1775, but being strongly opposed by counsellors,
petitioners, &c. it was not passed that year. A third bill
was brought in early in the following sessions, which was
also relinquished, in consequence of the harassing opposition
made to it. A new writ was then issued, and two members
again returned for the borough. It is considered to be the
property, and under the influence of the Beckford family,
of Fonthill. A particular account of the preceding cafe,
and proceedings, is given in the History of Boroughs, vol iii.
The first time it returned members to parliament was in the
27th year of Henry VI. Hindon consists principally of
one long street, built on the declivity of a gentle hill; and
is surrounded by part of the Downs. Here is a small weekly
market held every Thursday, and two annual fairs. About
two miles S. of the town is Fonthill-Abbey, the seat of
William Beckford, esq. The building is singular, and its
situation, seclusion, and history, are also replete with singular-
larities. On the apex of a lofty hill, nearly the whole of
which is covered with plantations, is a large building,
affording the exterior forms and character of a cathedral
church. A lofty arched porch, an octagonal tower, with
turrets, pinacles, and gates, are seen rising above the
trees, and together constitute a mass which may be seen at
the distance of several miles in almost every direction. The
interior of this mansion is however more an object of cu-
riosity, and more calculated to excite admiration than the
exterior. All the rooms are fitted up in a stile imitative of
the elaborate carvings, tabernacle work, &c. of the most
decorated church architecture; to heighten the effect of
which, paintings, gilding, sculpture, and the most costly
articles in upholstery, &c. are all brought together. The
richest treasures of the fine arts, and literature, are also ca-
phined within the walls; yet these curiosities and rarities are
excluded from public view, and the whole plantations and
houe are enclosed by a high wall, furnished by a che-
veaux de frie de iron.

HINDOO-KHO, or INDUS CAVEFS of Alexander,
part of a long ridge of mountains in Asia, which forms the
N.W. boundary of Cabul, and separates it from Balk and
Badakhan. This range takes a N.E. direction, between
Bamian and Anderab, after which it passes off to the E.
and N.E., until it appears again at the sources of the Jihon,
or Oxus, at about 150 miles to the E. of the city of Ba-
dakhan; and from thence passing on to the N., it gives rise
alto the Sijan (or Jaxartes.) (See HIMMALI.)
The city of Cabul is situated near the foot of this moun-
tain. (See CABUL.) Between the mountains of Hindoo-
Kho and those of Candahar, the country takes the form of
an extensive valley, from Cabul to the borders of Korfan.
The river Heermund or Hirmund issues from the north of
these mountains, and the waters of Cabul from that eait.
Hindoos-Kho is continued westward, under the range of
Gaur (which see), and in position answers to Parnaini-
foe.

HINDOOS, the inhabitants of that part of India, deno-
minated.
HINDOOOSTAN.

HINDOOOSTAN, a country of Asia, which, by the people of modern Europe, has been understood to mean the tract situated between the rivers Ganges and Indus on the E. and W.; the Thibetian and Tartarian mountains on the S.; and the sea on the S. But strictly speaking, the extent of Hindoostan is much more circumfered; and the name was applied to that part only of the tract, which lies to the N. of the parallels of 21 or 22'. The Nerbuddah river is, indeed, the reputed southern boundary of Hindoostan, as far as it goes; and the southern frontiers of Bengal and Bahar compose the remainder of it. The countries on the S. of this line, according to the Indian geographers, go under the general name of Deccan; and comprise nearly one-half of the tract generally known by the name of the Mogul empire. But as the term Hindoostan has been applied in a lax sense to this whole region, it may be necessary to distinguish the northern part of it, by the name of Hindoostan Proper. This tract has indeed the Indus, and the mountains of Thibet and Tartary, for its western and northern boundaries; but the Ganges was improperly applied as an eastern boundary, as it intersects in its course some of the richest provinces of the empire; while the Burmamooter, which is much nearer the mark as an eastern boundary, was utterly unknown. In this circumfered state, the extent of Hindoostan Proper is about equal to France, Germany, Bohemia, Hungary, Switzerland, Italy, and the Low Countries, collectively; and the Deccan and Peninsula are about equal to the British islands, Spain, and Turkey, in Europe. See Deccan.

The learned Mr. Wilkins affliured major Rennell, that no such words as "Hindoos," or "Hindoostan," are to be found in the Sanscrit dictionary. The people among whom the Sanscrit language was vernacular, styled their country "Bharaata." The Hindoos, however, call their country "Medhyana;" and they pretend that it was the portion of "Bharaat;" one of the nine brothers, whose father had the dominion of the whole earth. (See Asiatic Researches, vol. i. p. 419.) It is then probable, that the word "Hind" furnished that of India to the Greeks; and the termination "Sta," signifying country in the Persic, is of more modern date. It has happened, on this as well as similar occasions, that the name "India" has been applied not only to the country originally designed by it, but to others adjacent to and beyond it; for the countries between Hindoostan and China came to be called the further India, or India extra Ganges; whereas Hind, or India, properly belonged only to the country of the people called Hindoos; or those of India intra Ganges. The name is as ancient as the earliest profane history extant; and this circumstance serves, as well as others, to prove the high antiquity of the Persian language. For other appellations of the Hindoos and Hindooistan, see Gentoo.

HINDOOOSTAN, History of. Hindooistan, under one appellation or another, has laid claim to very high antiquity; but the earlier period of its history is involved in great obscurity and uncertainty. If we may credit the relations of some historians, the enterprising ambition of Sefoliris, supposed king of Egypt about 1435 years B.C., induced him to fit out a fleet of 400 ships in the Arabian gulf, which conquered all the countries stretching along the Erythrean sea to India. At the same time, his army, led by himself, marched through Asia, and subjected to his dominion every part of it as far as to the banks of the Ganges; and crofing that river, advanced to the eastern ocean. (Diod. Sic. lib. i.) Strabo, however, rejects the accounts of the Indian expedition of Sefoliris; and he not only affirms, in the most explicit terms, that this monarch never entered India (lib. xv.), but he ranks what has been related concerning his operations in that country with the fabulous exploits of Bacchus and Hercules. Arrian also concurs in the same sentiments with respect to the exploits of Sefoliris in India. (Hist. Ind. c. 5. Arrian, Exped. Alex.) And as Herodatus seems to have derived his information concerning India, not from the Egyptians, but from the Persians, it is probable that in his time there was little intercourse between Egypt and India. Dr. Robertson, in his "Historical Disquisition concerning India," has suggested a variety of considerations which enclude the improbability of such an expedition as that of Sefoliris into India. It is much more probable, that the Phenicians, having wrested from the Idumæans some commodious harbours towards the bottom of the Arabian gulf, held them as a regular intercourse with India on the one hand, and with the eastern and southern coasts of Africa on the other. But as the distance from the Arabian gulf to Tyre was considerable, and the conveyance of goods by land tedious and expensive, they took possession of Rhineycol, the nearest port to the Mediterranean to the Arabic gulf; and thus they were forwarded, partly by land and partly by sea, to Tyre. It is probable that Solomon's profitable traffic included that of India. As his kingdom extended from the Euphrates to the Red sea, and to the borders of the Red sea, (1 Kings, iv. 24.) it opened to him two of the great avenues to the east, by the way of the Red sea, and the Persian gulf. Volney suggests, that the object which Solomon had in view, when he took possession of Palmyra, was to use it as an emporium of the Eal India trade, by the way of the Persian gulf, and the course of the Euphrates. This was about 1000 years before our era. Solomon's trade, however, was merely temporary.

The first and most authentic accounts of Hindooistan are those which are given us by Herodotus, who lived 113 years before the expedition of Alexander the Great. From him (l. iv. c. 43. 44.) we learn, that Darius, the son of Hystaspes, explored regions of Asia formerly little known. Having subjected to his dominion many of the countries which stretched S.E. from the Caspian sea towards the river Oxus, his curiosity was excited to acquire a more extensive and accurate knowledge of India, on which they bordered. For this purpose he appointed Scylax of Caryanda to take the command of a squadron fitted out at Caspatyrus, in the country of Pactya (the modern Pabkeley), towards the upper part of the navigable course of the river Indus, and to fall down its stream until he should reach the ocean. After employing two years and six months in this expedition, he gave such an account of the population, fertility, and high cultivation of that region of India, through which his course lay, as rendered Darius impatient to become master of a country so valuable. This he soon accomplished; and though his conquests in India do not seem to have extended beyond the district watered by the Indus, he levied a tribute which amounted to nearly a third part of the whole revenue of the Persian monarchy. But neither the voyage of Scylax, nor the conquests of Darius, diffused any general knowledge of India. About 160 years after the reign of Darius Hytaspes, Alexander the Great undertook his expedition into India. Accordingly he set out from Bactria, and crossed that ridge of mountains, which, under various denominations, forms the "Stony Circle" (to adopt the phrase of oriental geographers).
HINDOOSTAN.

geographers) that encircles Asfa, and constitutes the northern barrier of India; and thus he discovered the route which was taken by the subsequent invaders of this country, Tamerlane and Nadir Shah. After passing the mountains, he encamped at Alexandria Parapamisana, not far from the mountains denominated the Indian Caucasus by his historians, and now known by the name of Hindo Kku (which means the extreme part of the navigation). The next day he crossed on the N.W. bank of the Indus, he crossed the river at Taxila, now attacks. He then marched forward in the direct road towards the Ganges, and the opulent provinces that lay towards the S.E., now comprehended under the general name of Hindoostan. But being opposed on the banks of the Hydaspes by Porus, a powerful monarch of the country, and by some other Indian princes, he was diverted from his route, and obliged to turn more towards the S.W., and to march through one of the richest and belt peopled countries of India, now called the Panjab, (which see). It was his intention to have pursued his march to the Ganges, and the fertile regions through which that river flowed; but his troops, having already suffered much, unanimously refused to advance farther, and Alexander was obliged to issue orders for marching back to Peria. This memorable transaction took place on the banks of the Hyphasis, which was the utmost limit of Alexander's progress in India; so that he did not traverse the whole extent of the Panjab. Upon his return to the Hydaspes, he found that the officers, with whom he had entrusted the charge, had assembled a numerous fleet, which he defined to sail down the Indus to the ocean, and from its mouth to proceed to the Persian gulf, that a communication by sea might be opened with India and the centre of his dominions. The conduct of this expedition was committed to Nearchus; and he was accompanied down the river by Alexander himself with a very great and magnificent armament. The distance to the ocean was no less than 1000 British miles, and the navigation occupied nine months. Of the extensive region through which they passed, a considerable portion, particularly the Upper Delta, stretching from the capital of the ancient Malli, now Multan, to Patala, the modern Tatta, is distinguished for its fertility and population. Alexander, having accomplished this object, led his army back by land to Peria; and Nearchus, after a coasting voyage of seven months, conducted the fleet safely up the Persian gulf into the Euphrates. With respect to the general state of India we learn, that in the age of Alexander, though there was not established in it any powerful empire, resembling that which in modern times stretched its dominion from the Indus almost to Cape Comorin, it was even then formed into monarchicals of considerable extent. From the memoirs of Alexander's expedition, preferred by Arrian, we also derive the first authentic information concerning the climate, the soil, the productions, and the inhabitants of India; and it is remarkable that the descriptions given by Alexander's officers delineate what we now behold in India, at the distance of 2000 years. The flated change of seasons, now known by the name of "Monsoons," the periodical rains, the flooding of the rivers, and the inundations occasioned by them, and the appearance of the country during their continuance, are particularly mentioned and described. No less accurate are the accounts which they have given of the inhabitants, their delicate and slender frame, their dark complexion, their black uncurled hair, their garments of cotton, their living entirely upon vegetable food, their division into separate tribes, or "castes," the members of which never intermarry, the custom of wives burning themselves with their deceased husbands, and many other particulars; in all which they peculiarly resemble the modern Hindoos. Alexander, however, explored only a small portion of the vast continent of India. His operations did not extend beyond the modern province of Lahore, and the countries on the banks of the Indus, from Multan to the sea. In India, however, he founded a city on the banks of the Hydaspes, Nambodar, a city not unlike the capital of the Achaemenian monarchs, and a third on the Acesines, both navigable rivers, which, after uniting their streams, fall into the Indus. By means of these cities he evidently intended to keep open a communication with India, not only by land but by sea; and also by clearing the navigation of the Euphrates and Tigris, he proposed that the valuable commodities of India should be conveyed from the Persian gulf into the interior parts of his Asiatic dominions, while by the Arabian gulf should be carried to Alexandria and distributed to the rest of the world. Seleucus, one of the successors of Alexander, entertained high ideas of the advantages that might be derived from a commercial intercourse with India, and, with a view of securing and extending them, he marched into the country, and advanced considerably beyond the utmost boundary of Alexander's progress. In order to obtain some knowledge of the country and the manner of its inhabitants, he selected Megalhennes, who had accompanied Alexander in his expedition to India, and deputed him as ambassador to Pulibothra, the famous capital of the Prafii, situated on the banks of the Ganges. Here he resided several years, and was probably the first European who ever beheld that mighty river, far superior to any of the ancient continent in magnitude, and no less distinguished by the fertility of the countries through which it flows. By this journey and settlement of Megalhennes, the Europeans gained an acquaintance with a large extent of country of which they had hitherto no knowledge. From his writings the ancients seem to have derived almost all their knowledge of the interior state of India, and the ample accounts of Diodorus Siculus, Strabo, and Arrian, appear manifestly to be a transcript of his words. But Megalhennes, being fond of the marvellous, has unfortunately blended with the truths which he related many extravagant fictions, and diminished our confidence in his other relations. The embassy of Megalhenes to Sandracottus, and another of Daimachus to his son and successor Allitrichidas, are the last transactions of the Syrian monarchs with India, of which we have any account. Nor can we fix with accuracy the time, or describe the manner in which their positions in India were wrested from them. It is probable that they were obliged to abandon the country soon after the death of Seleucus. When Bactria, originally subject to Seleucus, became an independent state about 69 years after the death of Alexander, the link of the chain that connected India with Syria was broken. The Indian trade was about the same time transferred from Tyre to Alexandria in Egypt, where it flourished under the auspices of the Ptolemies, (see Berenice,) until Egypt became a Roman province, and was continued on a more extensive scale by the Romans themselves; nor did it forake Alexandria until the rediscovery of the passage by the Cape of Good Hope. This traffic opened to the Egyptians and Romans a knowledge of the coasts and products of India. It is extraordinary, however, considering how much the detail of the coast was known to Ptolemy, that the general form of his map should have been derived from the truth; for he makes the coast between the Indus and Ganges to project only in a slight curve; whereas, they are known to form the sides of a triangle, whose perpendicular almost equals its base; Cape Comorin being the apex of it. Whoever, says major Kenell, compares the proportional dimensions of India, found
HINDOOSTAN.

in Diodorus Siculus, Pliny and Arrian, will find them tolerably just; and will be inclined to think that the worst fact of ancient maps of India has travelled down to us; and the decision of which the Greek map of that country takes its course; the capital of which has fluctuated between Delhi and Patna, as the limits of the empire have varied. This kingdom was that of the "Pafis," and "Gangaride;" in the times of Alexander and Megasthenes; which appears by the strength of its armies and the number of elephants trained to war, to have been very powerful. This kingdom, as major Rennell supposes, could not have been less in dimensions than France, extending westward to the Panjub country, and including at least part of Bengal; and, as Arrian describes it, its state was rich. The inhabitants were good husbandmen, and excellent soldiers; governed by nobility, and living peaceably; their rulers imposing upon them nothing harsh or unjust.

Major Rennell observes, that there is no known history of Hindooftan (relying on the foundations of Hindoo materials, or records), extant, before the period of the Mahomedan conquests; for either the Hindoos kept no regular histories, or they were all destroyed, or seceded from common eyes by the Pundits. The travels of Cosmas in the sixth century (see Cosmas), and of the two Mahomedan travellers in the ninth, afford few materials for history; but little can be gleaned from Marco Paolo, a Venetian nobleman, who crossed the peninsula, and went up the western side of it to Guzerat, in the 13th century. It is chiefly to Persians that we are indebted for that portion of Indian history which we possess. The celebrated Mahomed Feriduta, early in the 17th century, compiled a history of Hindooftan, from various materials, most of which, according to Col. Dow, who translated this history, were collected from Persian authors. But the translator allows, that the most valuable part of this history is that posterior to the first Mahomedan conquests, about the year 1000. The first Mahomedan conqueror, who made any establishments in Hindooftan, was Mahomed, emperor of Ghiziant; which see. In the year 1000 he entered Hindooftan; and although in 1058 all the Hindoo princes, from the west of the Ganges to the river Nerbuddah, united against him, for the common defence of their religion, which he wished to extirpate, and which he actually attempted to annihilate by the Savage destruction of their temples, they were defeated. After several successuful but defeated expeditions, Mahomed, in 1058, pillaged the country, and by which he became the largest part of Persia; as well as nominally, of all the Indian provinces from the western part of the Ganges to the peninsula of Guzerat, and from the Indies to the mountains of Agimeer; but the Panjub was the only part of it that was subjected to regular government under the Mahomedans; as being in the vicinity of the Ghizian empire. As for the Rajpoors of Agimeer, they still preferred their independence, among their rugged mountains, and close valleys; and not only then, but in a great measure, down to the present time; being, in respect of Hindooftan, what the country of Switzerland is to Europe; but much more extensive and populous. From Mahmood to Aouruzbebe the Indian conquerors were contented with the nominal subjection of three hardy tribes; among whom, military exaltation, grafted on religious principles, is added to strength and agility of body; and this race is diffused over a territory equal to half the extent of France, as it existed before the late revolution. It goes under the general name of Rajpoots; and is the original country of the founder of the MaharFoo state; whose ruler, about half a century ago, aspired at universal empire in Hindooftan. (See Maharfoos.) Upon the death of Mahomed Gori, in 1205, the
Indian part of the Ghiznián empire, then divided, fell to Cuttub, who founded the Panjab or Afgan dynasty in Hindoostan. The Afgans originally inhabited the mountainous tract lying between India and Persia, or the ancient Parapamisus. (For their history, see AFGHANS.) Before Cuttub's elevation to the throne, he had carried his arms under Mahomed Gori, into Agimere and Guzerat. Labour was, originally, his capital; but with a view of fixing the imperial residence nearer to the centre of his conquests, he removed to Delhi. The emperor Alamin, who succeeded to the Panat throne in 1210, completed the conquest of the greatest part of Hindoostan proper. He appears to have been the first Mahomedan that made a conquest of Bengal; and it was during this reign (1221) that Gugiz Cawu, among his extensive conquests, accomplished that of the empire of Ghizni; but he left Hindoostan undivell'd. About A.D. 1243, the Moguls, or Mungal, succéssors of Geniz, who poffeffed, or rather over ran the countries on the N. W. of Hindoostan, made severel irruptions into it; but it was not till more than 150 years afterwards, that, under Timur, or Tamerlane, they penetrated into the centre of India. The provinces of Hindoostan were held rather as tributary kingdoms, than as provinces of the same empire; and they seldom failed to revolt when a favourable opportunity offered. Of the fate of Hindoostan, a judgment may be formed by the punishment inflicted on the Mewatti, or the Bandit tribe, which inhabit the billy tracts within 25 miles of Delhi. In 1255, 100,000 of these wretches were put to the sword, and a line of forts was constructed along the foot of their hills.

"Rebellions, massacres, and barbarous conquests," says major Rennell, "make up the history of this fair country (which, to an ordinary observer, seems destined to be the paradise of the world); the immediate effect of the mad ambition of conquering more than can be governed by one man: for the whole empire being portioned out to rapacious governors, who domineering over the governed, until their spirits were sufficiently debauched, were at last able to perfuade them, that their common interest lay in taking up arms, to render these governors independent." It would appear as if the warm climates, and more especially the open countries, situated within them, were destined to be the fefts of depofition; for that the climate creating few wants, and the soil being productive without any great exertion; the inhabitants of it do not poffefs those energies that, in a cooler climate, prompt mankind to investigate their natural rights, and to affert them. This, however, is a point that I shall not venture to decide on; although I believe it is a fact not to be disputed, that throughout the known parts of the world, depofition prevails most in the warm climates. The Panat, Mogul, and Tartar conquerors in Hindoostan and China, however hard at first, have, in a course of ages, sunk into the same state of effeminacy with their subjects; and, in their turn, have, with them, received a new master. Let those who are in the habit of complaining of the severity of a northern climate, reflect, that whatever physical evils it may produce, it matures the great qualities of the mind; and renders its inhabitants pre-eminent among their species; while a flowery poet, or a more flowery historian, is the most eminent production of the tropical regions." (See CLIMATE.)

The Moguls, having gained acquisitions in the provinces on the W. of the Indus, in confluence of the sacrificé of the kings of Delhi, at length claffed that river, and invaded the Panjab; and so formidable did they appear to Ferfes II., that some tribes of them were permitted to settle in that country. (A.D. 1292.) In 1293 this emperor projected, at the suggetion of Alla, governor of Guzrah, an attack upon the Deccan, a tract nearly equal in extent to what he actually poffeffed in Hindoostan, and which extended from the shores of the Indus to the mouth of the Ganges, and from the northern mountains to Cattack, Sirojeg, and Agimere; the greatest part of Malwa, with Guzerat and Sindi, being then independent. Alla, incited first by avarice, having succeeded in his object, depofited and murdered the emperor, and took possession of the throne in 1295, begining his plan of conquest by the reduction of Guzerat; but while he was pursuing his conquests, the watchful and retreating Mungal penetrated even to Delhi, and plundered its suburbs. Alla, having extended his victories and possessions, died in 1316. At this period all Hindoostan proper was comprehended in the Panat empire (to called from the dynasty in possession of the throne), and the interior policy is paid to be so well regulated, that strangers might travel through the empire in perfect security. Ferfe II., who succeeded in 1351, appeared more defirous of improving the empire, after the defection of Bengal and the Deccan, &c. than of extending it by arms. Accordingly, canals and public works, for the improvement of agriculture and of the inland navigation, were his favourite objects during a reign of thirty-seven years. The Moguls made another expedition into Caffia in 1357; and after the death of Ferfes, in 1358, rebellion and civil war, during a course of several years, prepared the empire for foreign invasion, and a minority in the period of Mahmud III., who succeeded in 1298, brought matters to a crisis. In this state of things, Timur, who had already extended his empire over all the Western Asia and Tartary, turned his arms towards Hindoostan in 1398. In the proceeding year his grandson Peer Mahomed had prepared it for the way by reducing the Panjab and Moulatan; and before the close of the year, he himself crossed the Indus, and took possession of Delhi without a battle. He claims, magister," says Rennell, "who had credit enough with a poet of the (last) century, to be introduced on the stage, as a hero, poffessing great and amiable qualities, obtained in Hindoostan the title of "the destroying prince"; and was truly worthy of it, from the numerous massacres and exterminations executed under his immediate direction." He was rapid in his destructive movements; he spent little more than five months between the time of his entering and re-crossing the Indus; and he appears to have paid more attention to feazons than Alexander had done, as Timur chose the fair season for his expedition, whereas Alexander was in the field, in the Panjab, during a while rainy season. Timur, however, may be said rather to over-run than to subdue or conquer: for he did not disturb the order of succession in Hindoostan, but left Mahomed on the throne, relying to himself the possession of the Panjab country only; which his successors did not long retain. During his life, which ended in 1405, he was payed for in the moxiues of Hindoostan, and the coin was struck in his name; but this might be the more effect of policy in the usurpers of Mahomed's throne than the act of Timur. It does not appear that he carried much treasure with him out of Hindoostan. But Nadir Shah's acquisition of the precious metals, at a later period, was great beyond all ideas of accumulation in Europe; and is only to be accounted for by the influx of these metals from America, during the interval. The death of Mahomed happened in 1413; and with him ended the Panat dynasty, founded by Cuttub in 1295. The throne was then filled by Chizer, a Scid, one of the race of the prophet Mahomed, whose power occupied it until the year 1450, when Belloli, an Afghan of
the tribe of Lodii, took possession of it, on the abdication of Alha II., under whom all Hindooostan fell into separate governments. The ton of Belolli recovered a considerable part of the empire, and in 1501 made Agra the royal residence. It was during this reign that the Portugeus first accomplished the passage to India by the Cape, and Good Hope fell under the sway and control of the Portuguese.

Under Tor, the father of the celebrated Don Juan, in 1526, and this paved the way for the conquest of Hindooostan by Sultan Bahar, a descendant of Tamerlane and Gengiz Khan, who reigned over a kingdom composed generally of the provinces situated between the Indus and Samarcand. Diroprifed of his dominions by the Ubeafes, he determined to try his fortune in Hindooostan, whose distracted situation flattered his hopes of conquest. From Cabul, where he refided, he undertook his firft expedition across the Indus, in 1518. In the fifth expedition (A.D. 1525) he defeated the emperor of Delhi, and put an end to the dynasty of Lodii. Bahar reigned only five years in Hindooostan, during which time his chief employment was the reduction of the eaftern provinces. His fon Hamnoon fucceeded him in 1525; but by his family of confiderable abilities and virtues, he was driven from his empire in 1541. During his expedition, his fon Achar was born, whom we may reckon among the greateft of the Sovereigns of Hindooostan. The fate of this country was unfefted, that no less than five Sovereigns appeared on its throne in the course of nine years. A strong party in Hindooostan invited Hamnoon back; and he returned in 1534; but died in the following year. His good character facilitated the accelfion of his fon Achar, who was about the age of fourteen years, in 1555; when his father died. For a general account of Achar's character and reign, we fhall refer to the biographical article Achar, and also to the fistory of Hindooostan by Col. Dow. We fhall here add fome further particulars. As in the perfon of Bahar, the line of Tamerlane first afcended the throne of Hindooostan, fo in that of Achar, the grandson of Bahar, it may be faid to have been established. The conquest of their ancedors, about a century and a half before, had no ftrife in effecting the prefent Settlement. Bahar was in reality the founder of the Mogul dynasty; and from this event Hindooostan came to be called the "Mogul" empire. The firft years of Achar's reign were employed in the reduction of the revolted provinces from Agimere to Bengal; and his conquests were fecked by a proper choice of governors, by wife refolutions, by an unlimited toleration of religion, and by a proper attention to the properties of the people; to all which a long and vigorous reign was peculiarly favourable. The Hindoos flll formed the bulk of the people; even in those provinces, which, from their vicinity to the country of the conquerors, had been the moft frequently over-run; and experience had taught the Mahomedan conquerors that the paffive religion and temper of the Hindoos would, if left to themselves, never disturb the established government. But the Deccan was a stumbling-block to the Mogul emperors, and therefore engaged the particular attention of Achar. See Deccan.

Achar, who died in 1628, was fucceeded by his fon Selim, under the appellation of Jahanghir, who reigned about 22 years. It was in this reign, and in the year 1615, that Sir Thomas Roe was sent as the firft English ambaffador to the emperor of Hindooostan. The Portuguese had by this time acquired considerable settlements in Bengal and Guzerat; but only those in Guzerat, where they poffeffed fome extent of territory, attracted the notice of the court. Shah Jehan fucceeded his father in 1628; and during this reign, viz. in 1635, the firft serious quarrel happened between the Euro-
Hindoostan.

...and the French, in addition to the solid advantage of getting foothold of the northern circars, valued at half a million sterling, of annual revenue, gained the splendid but uncertain privilege of influencing the councils of the Nizam, by attending his perdon with their army. The Mogul was now become merely nominal, and the emperor was deprived in a great degree of their importance. Uffiepa, he endeavoured to obtain the function of their names, and the emperors throughout the whole tract, known by the name of the Mogul empire, is to this day struck in the name of the nominal emperor. In 1753 the emperor Ahmed was deposed by Gazi, after having reigned about six years.

In the preceding year the Marhattas had been called in to affift in reducing the Jats, who were in possession of Agra, and became troublesome neighbours to the emperor; and in the present year the Berar Marhattas established themselves in Orissa, by cession from Aliverdy, nabob of Bengal, who was also compell'd, for a short time, to pay them a tribute for Bengal and Bahar, amounting to one fourth of the clear revenue. This, together with the Mogul's former permission to collect the arrears of revenue due to him, is the foundation of their claims on Bengal and Bahar; and which they have never relinquish'd, although the times may have been unfavourable to their affisting them. Allumguire II. grandson of Bahader Shah, was placed by Gazi on the nominal throne, but Abdalla, being at this time in possession of Lahore, threatened Delhi, and in 1756 he laid the unfortunate city under heavy contributions. The emperor and his family were now reduced to the lowest state of royalty, alternately soliciting the assistance of Abdalla and of the Marhattas, and as much in dread of their allies as of their enemies. In 1760 Allumguire was deposed and murdered by Gazi. His son and successor, Shah Aulium, made a fruitless attempt to reduce the Bengal provinces; but his expedition ended in 1761, by surrendering himself to the British, who had taken the field as allies to the maharajah of Bengal. In 1759 and 1760 Hindooftan was visited, for the fifth time, by Abdalla, and Delhi was again plunder'd and almost depopul'd. The Marhattas, in these times of confusion and revolution, were gathering strength; and, possess'd of extensive domains and vast armies, they projected the expulsion of Abdalla, and the restoration of the Hindoo government throughout the empire. Thus the principal powers of Hindooftan were arranged into two parties, the Hindoos and Mahomedans; for the Jats joined the Marhattas; and Sujah Dowlah, with the Robillas, and other Mahomedan chiefs of his note, joined Abdalla; and a battle ensued in the plains of Carnawal and Paniput. There were said to be 152,000 Mahomedans, and no less than 200,000 Marhattas. Victory declared for Abdalla, after a very bloody and destructive battle; so that the Marhattas were compell'd to relinquish their pretensions to universal empire in Hindooftan; and from that period (1761) their power has been sensibly on the decline. (See Marhattas.) Abdalla's influence at Delhi was now unlimited; and he determined to place Shah Aulium on the throne of his ancestors. But he dreaded unitling himself in the hands of Abdalla, who set up Jewan Buct, the son of Shah Aulium, for emperor, exacting an annual tribute; so that in reality Abdalla was emperor, and if he had been dispos'd to establish himself in Hindooftan, he might probably have begun a new dynasty of emperors in his own person. The territory of the young emperor, and of Nidib Dowlah his guardian, was merely the northern part of the province of Delhi; and his father, Shah Aulium, the legal emperor, was without territory, and almost without friends. However, the expulsion of the nabob of Benares by Abdalla by the English, in 1763, by drawing Sujah Dowlah into the quarrel, brought the wandering emperor again into notice; but he had more to hope from the...
success of the British arms than those of his patron, Sujaah Dowla,
and the uninterrupted success that attended them in 1763,
64, and 65, by the diffusion of the armies of Cuffin Ally and
of Sujaah Dowlah, and by the entire conquest of Oude and
Allahabad, left the emperor and Sujaah Dowlah no hopes,
but from the moderation of the victors. (See Bengal.)
The private dittrenches of Shah Aulam, the emperor or
great mogul, were fo preying, during Mr. Hatting's last journey to Oude (1784) that his son, Jawan Bukht, came
to solicit alliance from the English. Since the peace of 1782, Madanjee Sindia, a Maharta chief, and the possessor
of the principal part of Malwa, has taken the lead at
Delhi; and has reduced several places situated within the
districts formerly possessed by the Jats, and it may be con-
cluded, that Sindia has in view to extend his conquests on
the side of Agimere, and to establish for himself a considera-
able state or kingdom. The provinces of Agra and Delhi,
and their vicinity, are in a wretched state. Having been
the seat of continual war for near 50 years; the country is
almost depopulated, and most of the lands, of course, lie
waifte; and the wretched inhabitants dare not provide more
than the bare means of subsistence for fear of pillage.
Nothing but the natural fertility of the soil, and the mildnesses
of the climate, could have kept up any degree of population,
and rendered the sovereignty of it, at this day, worth con-
tending for. In the Mogal empire, many parts of it were
1000 miles distant from the seat of government; and accord-
ingly its history is one continued feftination to kings; not to graip
at too much dominion; and too mankind, to circumscribe
the undertakings of their rulers.

Among the new powers that arose on the downfall of the
Mogal empire, we ought to mention the French and Eng-
lish. As for the Portugueze, their power had past its meri-
dian before this period; besides, their views being commercial,
they wisely chose insular situations, such as Goa, Bombay, Sal-
fette, Diu, &c., and never appear to have possessed any very con-
siderable extent of territory, although they kept on foot a large
army of Europeans. The Dutch fyllem was nearly the same;
and their prosperity, in a great measure, grew out of the misfortunes of the Portugueze: who, having fallen un-
der the dominion of Spain, became obnoxious as well to the
jealousy of rivalry, as to the revenge of the Hollanders.
The French power was of short duration, but brilliant while it lasted. It began during the government of M. Duplex
at Pondicherry in 1746, and ended in 1761 by the capture of
this their principal settlement. (See Ceylon.) The French appear to have been the first European power that
trained the natives of India to regular discipline, as well as
the first who set the example of acquiring territorial pos-
sessions, of any great extent, in India; in which they have been so successfully followed by the English. Although the English were firmly and peaceably established in Bengal in
1765; (see Bengal;) yet within two years they were engaged in
a very arduous contest in the peninsula, with Hyder Ally, the sovereign of Myfere, joined with the
Nizam or Soujah of the Deccan. (See Hyder Ally.)
In 1757, when he had arrived at the height of his fortune,
the war between him and the English broke out. Having
bought off the Mahrattas, with a considerable sum of money,
and the restoration of some places he had taken from them,
and detached the Nizam from the English, the war was pro-
cated on both sides with vigour. After some sharp battles on
the frontiers of the Carnatic and Myfere, a strong detach-
ment of the British army feizéd on Hyder's province of Co-
imbetore, a fertile district on the south of Myfere, and
commanding a ready way to Hyder's capital, Seringsapatam.
The war was continued with various successes during the years
1767, 1768, and part of 1769; when Hyder, with a strong
detachment of troops, chiefly horse, ending the British
army, came within seven miles of Madras, and dictated a
peace to the government of that place. This peace was
disreputable to the British councils only; since the hands of
the commander in chief (general Joseph Smith) were tied up,
at the very moment, the most favourable for striking a blow;
and when Hyder, fearing the general's approach, could
purchase his security no other way than by intimating go-
vernment into the measure of laying their commands on the
general not to advance; by which measure he might possi-
ibly have cut Hyder and his detachment to pieces. The Ni-
zam had, very early in the war, been detached from Hyder's
alliance; chiefly by the strong measure of sending a detach-
ment from Bengal into the heart of Golconda; which made
him tremble for his capital, Hydrabad. The peace left
matters much in the same state as they were before the war;
and whatever credit Hyder might have gained by its ter-
mination, was done away by the total defeat which he suffered
in 1771 from the Mahratta army, within a few miles of his
capital; into which he escaped with great difficulty, with a
small remnant of his army; afterwards defying the attacks of
his numerous enemies, who had neither the skill nor the
ordinary requisites for a liege. His revenues and his army
were improved by the few years of peace that followed.
When the Mahrattas, in 1773, crossed the Ganges to invade
the Rohilla country, a brigade of the British army marched
to the western frontier of that country, and drove the
Mahrattas across the river. For this protection, the Rohilla
chiefs had stipulated to pay Sujaah Dowlah (the British army
acting as his allies) 40 lacks of rupees; but when the
service was performed, the payment of the money was
evaded. This breach of treaty led to the invasion and con-
quest of the Rohilla country in the following year, 1774.
A considerable tract of land in the Doobab was also con-
quered from the Jats and other adventurers, by which the
boundary of Oude was advanced westward within 25 miles
of Agra; north-westward, to the upper part of the naviga-
table course of the Ganges; and south-westward to the
Jumna river. In 1775, on the death of Sujaah Dowlah, and
the accession of his son Azubah, a new treaty was made with
the British government, by which the quantum of the subsidy
for the use of the brigade was increased; and the province
of Benares, which produced a clear revenue of 240,000l. per
annum, was ceded to the company. The war with the Por-
nah Mahrattas occasioned the march of a brigade across the
country to the side of Bombay and Surat in 1778-9. This is said to be the most brilliant epoch of the British mil-
tary history in India. The brigade, which confided of less
than 7000 men, all native troops, commanded by European
officers, marched from the banks of the Jumna to the
western sea, in spite of the Mahrattas, whose empire they
traversed almost the whole way. The French war breaking
out at this time, and Hyder Ally expecting a communion of
interests with the French, broke into the Carnatic, in the
autumn of 1780, with 100,000 troops, foot and horse, the
best of their kind that had ever been disciplined by a native of
India. His successes in cutting to pieces colonels Belisle's de-
tachment, and the consequent retreat of the Carnatic army,
occaioned a despair of the British interest in that quarter,
in the opinion of most people in Europe. Mr. Hatting's and
Sir Eyre Coote thought otherwise; and there was fear from
Bengal, to the relief of the Carnatic, a brigade of about
7000 men, with ample supplies of money and provisions.
Until these troops and supplies arrived, the British possessed
nothing more in the Carnatic than the ground occupied by
their camps and fortresses. Under Sir Eyre Coote, Hyder
was
was successfully combated during two campaigns; at the end of the year (October 1828) he found the possession of his object, the Carnatic, at so great a distance, that he appeared to be fiercely desirous of peace. Hyder perceived the necessity of abandoning his ambitious projects; and he would actually have done so, in all probability, if he had not expected a more feasible and efficient co-operation on the part of the French, with whose alliance he hoped to effect our expulsion in a campaign or two. But he became more jealous of the French than of the English; and if the peace of Paris had left the Carnatic in his hands, instead of Mahomed Ally's, the French would have found the ill effect of his conduct respecting them; for he certainly never intended that they should assume any character in it besides that of merchants. With this disposition of mind, Hyder died soon after, in 1783, and was succeeded by his son Tippoo, who made peace with the English in March 1784, at Mangalore. Tippoo was a prince of inferior abilities, and on a future occasion he expiated his ill-arranged plans by his death, and the partition of his territories in 1790.

The establishment of the British power in the Mogul empire has given a totally different aspect to the political face of that country from that which it would have worn, if no such power had ever existed. It is certain, that the Mahrattas, if they had been left to pursue their plans of conquest, would have acquired Corah and Allahabad in 1772, as well as the Rohilla country in 1775; and afterwards they might have over-run, at their leisure, the province of Oude, and its dependencies. The British interference prevented this. On the other hand, Hyder might have kept possession of the Carnatic. Some may be tempted to ask, whether Hyder might not be as good a sovereign as Mahomed Ally; or the Mahrattas, as Azapul Dowlah? Whatever may be the answers to these questions, facts more recent, they have no reference to the British politics, which required that Hyder or Tippoo should not possess the Carnatic, in addition to Mysore; and that the Mahrattas should not possess Oude, or Rohilkhand.

It has been suggested, that the British might have extended their possessions in Hindoostan, ad libitum; lord Clive, however, thought, that the Bengal provinces and the circars, together with a moderate tract of land round Madras, and the island of Salfette, near Bombay, were fully equal to the measure of good policy; and to our powers of keeping possession.

"The flate into which Hindoostan has fallen," says Rennell, "since the downfall of the Mogul empire, is materially different from what it was before it was united under the Mahomedan conquerors. It was then parcelled out into several moderate kingdoms, which appear to have preferred a degree of balance among themselves; but now Hindoostan and the Deccan may be laid to consist of six (or, since the partition of Tippoo's territories, of five) principal states, which hold, as tributaries, or feudatories, all the inferior ones; of which there are many. The reader will not be at a loss to know, that the two Mahratta states, the Nizam, Tippoo, the Sultans, and the British, are those I mean; for whatever verbal distinctions may be made, a composite alliance is at least a dependant, if not, in fact, a tributary nation." Rennell's Memoir, Ed. 3. 1793.

Hindoostan, Geography of. This celebrated portion of Asia, long known by the name of the empire of the Great Mogul, because it was then subject to Mogul emperors, successors of Timour, extends from easte Conorin on the boundary, to the mountains which form the northern boundary of Caffraria; that is, according to the most recent maps, from about the 8th to about the 35th degree of N. lat., being about 27 degrees, or nearly 1890 British miles. The northern boundary may be further extended to the Hindostan Rob, and mountains running E. and W. on the N. of the province of Kutzer. In breadth, this country extends from the river Araba, on the W. of the province of Hindoo, to the mountains which separate Bengal from Caffraia, and the British dominions, it is, from about the 66th to the 52d degree of E. long., comprehending 26°, which, in the latitude of 25°, include 1600 British miles. On the N. the boundaries are the mountains already mentioned. On the W., towards Persia, other ranges and deserts form the frontier, till the river Araba terminates the southern separation. The other boundaries are supplied by the Indian ocean and bay of Bengal, where the eastern extremity is limited by the little river Nafl, and those mountains which separate the British possessions from Araca, Caffa, and Caffiar. The northern boundary generally consists of the southern ridges of the Thibetan Alps. On the N.E. of Bengal a similar ridge divides Hindoostan from the small territory of Ayam, which seems an independent state, never having formed a part of Hindoostan, of dubious connection with Thibet, and hitherto unsubdued by the Birman. According to the plans published out and purveyed by major Rennell, and judiciously adopted by Mr. Pinkerton, we may distribute the various regions of Hindoostan into four general sections: viz. the Gangetic, the Sindetic, the central, and the southern.

Gangetic Hindoostan, comprehending the countries on the Ganges, extends from the easter boundaries of Bengal to the country of Sirkhund, an interval of about 1000 British miles. Its greatest breadth, from the sources of the Chumbul, to the mountains of Sewalik, may be about 450 British miles; and the head, on the W. of the province of Ayam, about 230. This section comprehends the provinces of Bengal, Bahar, Allahabad, Oude, and Agra; with part of Delhi and Agamore, and of Malwa in the south. The British possessions in this part of Hindoostan, including Bengal, Bahar, Benares, and some other districts to the W., extend about 550 miles in length by 300 in breadth, forming a very powerful kingdom. The native population is computed at 10 or 11 millions of black subjects, exclusive of the English, whose number is not ascertained. Sir William Jones, however, concluded from the actual enumeration of one province, that all the British possessions in Hindoostan included no less than 30 millions of Hindostans; but major Rennell estimates the entire population in the time of Aurungzebe at 60 millions. The revenue of these British provinces is computed at 421,000l.; and deducting the expense of collection, military and civil charges, &c. being 2,510,000l., the clear revenue will be 1,670,000l. (See Bengal, and Calcutta, its chief city.) In the easter part of the British possessions, the most considerable town is Dacca, which, fee. (See also Messoora, and Hindoo.) The capital of the province of Bahar is Patna; which fee respectively. Benares (which fee) is near the western frontier of the British possessions. Beyond the British possessions towards the W. is Allahabad, in a province of the same name, ceded to the English in 1758; and to its S.W. are the diamond mines of Panna, in the small province of Bundelkund, or Bundeh, which fee. The present capital of Oude is Lucknow; to the N.W., near the northern frontier, is Berilli; and about 30 miles W. from Lucknow is Canoge, which fee. (See also Agra and Delhi.) The farthest city in the south of Gangetic Hindoostan is Oujen; and the river Nerbudda may be considered as its most southern limit. The surrounding states on the E. and N. are the Rothen of Rennell or Araca, Caffa or Meckley, Alem, Beotan, Nipal, Gorkah, Kamacon, and Siremagar, which fee respectively.
HINDOOSTAN.

Indus, and Part medial Beder. 400,000/..; To Tributaries. Azuph millions Other Barra-Mahal, and 1783, In Joodpour. Little Beiides 5. For and 790, 1792 See Adoni, Part D.milh Pattan mouth ill is Tatta hore, niiras the name alio tude Cambav, cities of Beehmah, lv.iglilh 830 1

ment Madras, quebar, On following alterations, whatever Hindoollan, and its extentive region, which is called the Carnatic, and its most northern tributary streams flowing into the Beemah, and may be considered as extending from the latitude of Bombay to the southern point of cape Comorin, about 830 miles in length, and about 370 of medial breadth. (See Dvican.) In this division may also be included the island of Ceylon, the coasts of which are supplied by the English, who have supplanted the Dutch; while the native princes retain the extensive inland parts. In addition to the districts round Madras, the British power was extended in 1792 and 1799, over wide provinces in the south and west of Mylore; and Seringapatam, the capital, is also in our possession; so that our territories in this portion of Hindoostan only yield in extent and consequence to those on the Ganges. The chief cities and towns in this division are Seringapatam, the most important; Salem and Attore on the E.; Dinigul, Coimbore, and Palanicon, on the S.; and on the W. coast Panur, Ferokabad, Calicut, now nearly deserted, Tellicherry, and Mangalore; and on the N. Carwar, within 40 miles of the Portuguese settlement of Goa, while on the S. we approach within a like distance of Cochin. In the Carnatic we have Madras, and not far from the western frontier of our settlement at Madras is Arcot, esteemed the capital of the Carnatic. To the south of these British possessions are Tranquebar, a Danish settlement in the kingdom of Tanjore and Pondicherry, formerly the principal settlement of the French. On the western coast, or that of Malabar, stands Cochin, which is. To the north of the British territories are Goa, Poona, Viliapour, Hydrabad, Calberga, &c.

The three leading powers of Hindoostan are the British, the Mahrattas, and the Nizam; to which may be added on the W., or Sindee division, the Seiks, and Zemman Shah, or whatever prince holds the eastern division of Peria. The following table, extracted by Mr. Pinkerton, with a few alterations, from Major Rennell's Memoir, will convey a satisfactory view of the state of territory, and the ruling powers in Hindoostan.

I. British Possessions.
1. Bengal and Bahar, with the Zemindary of Benares.
2. Northern Circars, including Guntoor.
4. Jaghire in the Carnatic.
5. The Calicut, Palicau, and Coorga countries.
6. Coimbetore, Cannar, and other districts acquired in 1799.

II. British Allies.
1. Azuph Dowlah, Oude.
2. Mahomed Ally, Carnatic.
3. Travancore, and Cochin.

III. Mahratta States.
Poon Maharrattas.
1. Malwa.
2. Candeith.
3. Part of Amedanour, or Dowlatabad.
4. Viliapour.
5. Part of Guzerat.
6. Agra.
7. Agimere.
8. Allahabad.
9. Sandore, Bapacheur, Dar, war, &c. situated in the Doob, or country between the Killnah and Toombuddha rivers.

Berar Mahrattas.
1. Berar.
2. Orilla.

Bambajees.

IV. Nizam Ali, Sonbah of the Deccan.
1. Golconda.
2. Aurungabad.
3. Beder.
4. Part of Berar.
5. Adoni, Rachore, and Canoul.
6. Cuddapali, Cumber, and Gandicotta.
7. Part of Gooty, Adoni, and Canoul.
8. Part of the Doob.
9. Other districts acquired in 1799.

V. Seiks.
Lahore, Moulton, and the western districts of Delhi. As the other great power chiefly extends over Persia, and may be regarded as foreign, it only remains to mention the

2. Jats.
3. Pattan Rohillas, Furruckabad, Rohilkund.
4. Adig Sing, Rewah, &c.
5. Bundelkund, or Bundela.

To which may now be added the Raja of Mylore. Before the fall of Tippoo in 1799, the British possessions were supposed to contain 197,496 square British miles, being about 60,000 more than are comprised in the united kingdoms of Great Britain and Ireland; and the number of inhabitants was computed at 10 millions. The acquisition in 1799 probably adds 15,000 square miles, and the population subject to Great Britain is supposed to be 12 or 14,000,000. The net revenue exceeded 3 millions before the cessions by Tippoo in 1792, computed at 450,000/; while those in 1799 do not appear much to exceed half that sum. For an account of the Mahrattas, Seiks, Jats, and Afghans, see their articles respectively.
The original population of this extensive country may be generally considered as indigenous, yet it presents considerable varieties.
HINDOOSTAN.

varieties; those in the northern parts being fairer, and those in the southern almost wholly black, but without the negro wool or features. The tinge, however, of the women and superior classes is deep olive, with sometimes a flight and agreeable mixture of the ruddy, and the Hindu form and features may be said to approach the Persian or European standard.

Of the mythology and religion of the Hindoos we have already given an account under the article Gentoos. (See also BRACHMANS and CAST.) The governments are as various as the several states. Although the Brachmans are the most dignified class, the sovereignty has been abandoned to the military cast, and the monarch was preferred to be proprietor of all the lands, except those belonging to the church. The "Ryots" held their possessions by lease at a fixed rate, and considered them as perpetual. The "Zemindars" were, as some conceive, only collectors of the royal rents from the Ryots, or farmers; but, as others imagine, they were learned gentlemen, who had an hereditary right to these rents, upon paying a settled proportion to the crown. The laws are blended intimately with their religion; and an account of them may be found in the code published by Mr. Halhed, and referred to under CEYLON.

The population of this extensive part of Asia consists of Hindoos blended with Persians, Greeks of Bactriana, ancient Scythians, Mahometans of various origins, Patans or Afghans from the mountains towards Persia, Moguls, including Tartars and Mahometan tribes from the east of the Caffian, who, with the Arabs and Persians, are generally called Moors; and it is supposed to amount to 60 millions, of which number the British possessions may probably contain a quarter. In the time of Arunzhezé the general revenues of Hindooostan were computed at 52 millions sterling, equal, allowing for the comparative price of the productions of the country, to 160 millions sterling in modern England. The manners and customs of the Hindoos are very much incorporated with their religion, and are universally similar, with some few exceptions in mountainous and other peculiar districts. Their houses and dreffles are of the most simple kind, and to a Brachman nudity is no reproach. Their amusements consist of religious proceedings, and though dancing girls are numerous, theatrical exhibitions are least common in countries farther to the east. The general ancient language of Hindooostan is believed to have been the Sanskrit; which see; but of this there are various dialects in different provinces. Of their literature we have had many confused and contradictory reports; but their most important books are the Vedas. (See BRACHMANS.) Dr. Robertson alleges several considerations in proof of the ancient and high civilization of the Hindoos; but against his arguments to this purpose others have advanced many objections. (See CAST.) The arguments of M. Bally and others for the antiquity of the Hindoo astronomy have been attacked with great force by Mr. Bentley, in a learned dissertation published in the fifth volume of the Asiatic Researches, 1799: and the result appears to be, that the sythology, so highly extolled and traced to remote antiquity, cannot be of a greater age than 731 years; or that it was composed about A.D. 1608.

The chief university in the north is that of Benares; and in the Deccan, the academy of Trichur, on the Malabar coast, is also in great repute; and at Cangibum, in Carнате, we are told, there is still a celebrated Brahman school, which, according to the testimony of Ptolemy, existed in the first century of the Christian era, and its members, it is said, are equal in celebrity to the Brahmins of Benares. The manufactures of Hindooostan have been cultivated from a remote antiquity, particularly those of muslins and other cotton fabrics. Piece goods, as we call them, are mentioned by the authors of the Periplus, and other ancient writers, who commend both the manufacture and the beautiful colours of the dyes. In the time of Strabo, the Hindoos were famous for elegant works in metals and ivory. Hindooostan, however, is not celebrated at this day for any manufacture, except those of muslins and callicies; the other exports consisting of diamonds, raw silk, with a few wrought filks, spices, drugs, etc.

Painting and sculpture are in their infancy; and yet the temples are majestic and solemn. Hindooostan has, in all ages, been chiefly famed for its native products; its diamonds, and some other precious stones, its spices, aromatics, and drugs; rice also, sugar, and many articles of luxury, are products of Hindooostan.

The climate and feasons are considerably diversified by difference of latitude and local situation; nevertheless, through the wide regions of Hindooostan there is some sameness of climate. (See BENGAL.) Although in Tibet the winter nearly corresponds with that of Switzerland, and other parts of Europe, in the whole extent of Hindooostan, except in Cashmire, there can hardly be said to be a vefible of which except the thick fogs of our November; and excessive rains, or excessive heat, form the chief varied of the year. The aspect of the country is very much diversified; but there are no mountains of any very great height; the Gaus (which see) not being estimated at above 3000 feet. The vail extent of Hindooostan consists chiefly of large plains, fertilized by numerous rivers and streams, and interspersed with a few ranges of hills. The periodical rains and intense heat produce a luxuriance of vegetation, almost unknown to any other country in the globe; and the variety and richness of the vegetable creation delight the eye of every spectator. The soil in some fplaces is so excellent, that it consists of black vegetable mould to the depth of fix feet. Rice is the chief grain, which is industriously watered on the dry sandy lands of the coast of Coromandel. Maize and the sugar-canes and cotton are also much cultivated. But the implements of husbandry are in general so imperfect, that they owe to the fertility of the land what they want, either in skill or diligence of agricultural operations.

The two principal rivers of Hindooostan are the Ganges and Burumpooteer, which see: the chief tributary streams of the Ganges are the Gagra or Sarjoo, the Jumna, which receives the Chumbul, Betwa, and several others, and the Suan. The Indus, or Sind, with its confluence streams, is also a principal object. Its tributary streams are very numerous; see SINDH. The chief rivers of the central part of Hindooostan are the Padna, Perbuda, and Tappee, on the W.; the Subanreeka, the Godavery, &c. In the southern part of Hindooostan are the Kilkna, Penmar, Palmar, and Caveri. This country has few lakes; those of Colhar, Chilka, Pullicat are mentioned by Rennell. The mountains, differentiated by their modern names, are the Tipera, Garra, Himmaleh, Hindoo-koh, Gaus, &c. Hindooostan abounds with forests, some of which are near the mouths of the Ganges, &c. others in the rude unexplored regions on the W. of the Circars. On the call of the Indus is a sandy defile, between 4 and 500 miles long, and from 60 to 150 miles broad; it is filled of that of Agimere, and was known to Herodotus.

The botanical productions of this fertile country are too numerous and various to be noticed. Its cattle are frequently of a large size, with a hunch on the shoulder; and its sheep are covered with hair instead of wool, except in the most northern parts. Antelopes, camels, elephants, asps and monekies, dogs, wild boars, bears, wolves, foxes, jackals, hyenas, leopards, panthers, lynxcs, and many other quadrupeds are found in this country. It would be endless.

50
to enumerate the birds, fishes, and insects that abound in Hindostan. We shall conclude this article with mentioning some of its most celebrated mines. Those of the diamond are near Vindhyapur and Golconda, at Raolconda, in a district on the river Mahananda, S. of Bamboulour, Gandicotta on the river Pennar, and Penna in the territory of Bundelcund, about 60 miles S. of the river Jumna, withSynopsis into the Ganges. (See DIAMONDS.) Robertson's India. Raynall's Index. vol. ii. Russell's Memoir, passim. Pinkerton's Geography, vol. ii.

HINDOOSTANEE, the vernacular language of the Hindoos. It is also frequently denominated Hindu, Oordoo, and Ralh. It is compounded of Shanercit, Persian, and Arabic. The first of these was the great original language of India, and to it may be traced such terms in the provincial dialects as are of truly Indian original; and such words as bear no relation to the Shanercit roots are either Persian or Arabic.

The Persian was carried into India by the Mogul conquerors, and being the language of the court, naturally gained a footing in the law and in the revenues. It has also for some centuries been the common medium of communication between the several states of Hindostan, and from thence became an almost indispensible qualification for those who were engaged in the management of Indian affairs. The Persian is still used by all the Mogul officers of government, in their several departments of accounts and correspondence. Thus the Hindoostanee received a great influx of Persian terms, and many peculiarities of the Persian idiom. The original language of the Hindoos, from a similar cause, became debased by a copious mixture with Arabic. When the Mahometan invaders first settled in India, from the necessity of having some medium of communication with the natives, whom they had conquered, they applied themselves to the study of the Hindoostanee dialect. The knowledge of the Shanercit was impracticable, from the invincible aversion of the Gentoos to teach to foreigners, and to conquerors, the use of their own tongue. The latter, therefore, had no resource but to introduce, as far as they could, their own language. New adventurers, continually arriving, kept up a constant influx of exotic words, and the heterogeneous mafals gradually increased its flocks, as conquest or policy extended the boundaries of its circulation. But these alterations affected words only. The grammatical principles of the original Hindoostanee, and the ancient forms of conjugation and inflexion remained the same; and whist the primitive substantives were excluded, or exchanged, the verbs maintained both their inflexions and their regimen. The Shanercit, indeed, has a dual number, both to nouns and verbs, the Hindoostanee to neither. Verbs in Shanercit have the same form for both the masculine and feminine genders. The Hindoostanee verbs are distinguished by different terminations for the different sexes, like those of the Arabic. These are the capital outlines of diffidence between the Shanercit and the Hindoostanee; but in the original appropiation of particular words to particular sexes, in the idiomatic turns of expression, and complexion of speech, we may observe the strongest family likeness. The characters also, peculiar to the Hindoostanee, are exactly the same with those of the Shanercit, but of a ruder shape, yet still exhibiting a more accurate resemblance than is found in many of the Greek letters in inscriptions of different eras.

From the above statement it is obvious, that the primitive Hindoostanee tongue has by no means preserved its purity or its univeratility to the present age: for the modern inhabitants of India vary almost as much in language as in religion: and at present these persons are thought to speak this compound idiom with the most elegance, who mix with rare Indian verbs the greatest number of Persian and Arabic nouns. Such of the Hindoos as have been connected with the Mahometan courts, or admitted to any offices under that government, have generally complimented their manners by a compliance with these literary innovations. But the Brahmans, and all other well-educated Gentoos, whose ambition has not overpowered their principles, still adhere with a certain conscientious tenacity to their primeval tongue.

As the intercourse and communication of the Mahometans with the natives of India was greater or less, according to certain circumstances and situation, the Hindoostanee naturally varied considerably with respect to the prevalence of one or other of the three great languages composing it. This circumstance, says Mr. Bailey, in his Collected Thesauri, on the importance of this language, will function a division of it into three distinct dialects, namely, the plain or country; the middle or familiar; and the learned or court dialect; each of which are respectively useful in different districts. In the first or plain dialect, there is a smaller admixture of foreign words. Hence this is more nearly similar to the original dialect of the country. In the second, or familiar dialect, the number of foreign words bears nearly an equal proportion to the original ones. In the third, or court dialect, Arabic and Persian words are by far the most numerous.

In recommending the study of this language, the above-mentioned author affirms that to the merchant, the traveller, the civil and military officer, the philosopher and physician, in short, to every one who carries on concerns of any moment in India, the Hindoostanee language is more generally necessary and advantageous than any other. For this reason it is of late become an object of indispenfible attachment to all those young gentlemen who are destined to engage in Indian affairs. In the whole of the vast country of Hindoostan, scarcely any Mahometan will be found who does not understand and speak the Hindoostanee. Every Hindoo also, of any distinction, or who has the least connection either with the Mahometans or the British government, is acquainted more or less with this language. It is moreover the general medium by which foreigners, such as the Portuguese, Dutch, Danes, French, Arabs, Turks, Americans, Persians, Moguls, and Chinese communicate their ideas to each other. In almost, too, all the armies of India this appears to be the language universally used; though many of the individuals composing them must be better acquainted with the dialects peculiar to their respective districts. Finally, from Cape Comorin to Cabul, a country about 10,000 miles in length, and 1,500 in breadth within the Ganges, few persons will be found in any large villages or towns, which have been conquered or much frequented by Mahometans, who are not sufficiently conversant in the Hindoostanee, and in many places beyond the Ganges this language is current and familiar.

The dialect called the Mores, is that mixed species of Hindoostanee which owed its existence to the Mahometan conquests. In this idiom several elegant poems and tales have been composed by learned Persian and Mogul authors, and are still extant in the libraries of the curios. These are always written in the Persian hand, which is by no means calculated for expressing the sound either of the Hindoostanee vowels or nasal consonants. The Mahometans of the lower rank have a few books on religious subjects in this language and in the Nizagare characters; which are also used by some of them in their petty accounts. Europeans, on their arrival in India, reduced to a necessary intercourse with Mahometan servants or Sepoys, habitually acquire from
from them this idiom in that imperfect and confused state, which is the conformance of the mental condition of their instructors. Yet this curious system of study hath produced more than one attempt to a grammar and vocabulary.

These attempts are unworthy of notice; but the labours of Dr. Gilchrist deserve particular attention. His English and Hindooftanee dictionary, which was intended to be followed by another part in Hindooftane and English, is a highly-valued production, and his grammar, as containing a copious detail of the language with numerous specimens of Indian poetry, is a performance not less valuable and useful to the oriental student, though it cannot boast the facility, the taint, the philosophical acuteness, and the extensive acquaintance with the classical languages which distinguishes the Persian grammar of Sir W. Jones, or Mr. Halls's grammar of the Bengalese. But Dr. Gilchrist's chief merits consist in the attempt which he has made to teach the Hindooftane language in European characters. To effect this purpose, with success, required great skill and diligence, as many European letters correspond as little found, as they do in form, to those of India. There are two general modes, (says Sir W. Jones, in his Dissertation on the Orthography of Asiatic Words,) of exhibiting Asiatic words in our own letters; they are founded on principles nearly opposite, but each of them has its advantages, and each has been recommended by respectable authorities. The first proceeds to regard chiefly the pronunciation of the words intended to be expressed, and this method, as far as it can be purified, is unquestionably useful; but new sounds are very inadequately presented to a sense not formed to receive them; and the reader must, in the end, be left to pronounce many letters and syllables precisely; besides that, by this mode of orthography all grammatical analogy is destroyed, simple sounds are represented by double characters, vowels of one denomination stand for those of another; and possibly with all our labour we perpetuate a provincial or indecent pronunciation. The second system of Asiatic orthography confers upon us rendering letter for letter without any particular care to preserve the pronunciation. The first of these methods had an advocate in major Davy, an elegant Persian scholar, and a member of the Asiatic society; the second found two able supporters in Mr. Halls and Dr. Wilkins, to whom Sir W. Jones bears the honourable testimony of having done more towards promoting Indian literature, than Europe or India can ever sufficiently acknowledge. The former justly remarks that the two greatest defects in the orthography of any language, are the application of the same letter to several different sounds, and of different letters to the same sound, and these defects he truly pronounces to be so common in English that he was exceedingly embarrassed in the choice of letters to express the sound of the Bengalese vowels, and was at last by no means satisfied with his own selection; Dr. Gilchrist has adopted neither of the above modes, but embraced a scheme which affords the advantages of both, without the inconveniences peculiar to either. His plan is to define the sound of the European letters, and then to use them in every word as representatives of the Hindooftane elements, without ever the slightest variation. The Indian letters seldom experience any change of pronunciation, and it was only necessary to adjust their sound to our characters, in order to express them with corresponding uniformity. By this plan he has paid due attention to the pronunciation of each word, and of its elements. His system is peculiar to himself, and is likely to be rejected by those who cannot pay to it the time and attention necessary to perceive its excellence, and to reap its advantages. The scholar who can make this sacrifice will readily acknowledge the usefulness of Dr. Gilchrist's system, though he cannot fail to lament the pedantry and want of uniformity which disfigures his works.

HINDOWN, in Geography, a town of Hindooftan, in the Subah of Agra; 25 miles N. of Kerowly. This has been a large city, and contains extensive buildings, but, in consequence of the depredations of the Mahattas, is now thinly inhabited.

HINE, or HIND, in the Saxon Language, signifies a servant, or one of the family; but it is now taken in a more restrictive sense, for a servant at husbandry; and the matter here be that overreaches itself.

HING, in Geography, a town of China, of the second rank, in the province of Kiang-nan. N. lat. 32° 35'. E. long. 107° 26'.

HINGES, in Buildings, those necessary iron ligaments, by means whereof doors, lids, folders of tables, &c. make their motion, whether of opening, shutting, or folding.

The species of hinges are many, viz. bed, box, butt, cabinet; casing, chest, coach, deity, dove-tails, efig, folding, garnets, weighty, side, side with rising joints, side with squares, screw, fettlet, shutter trunk of tundry forts, and hook and eye hinges.

HINGHAM, in Geography, a small town and parish in the hundred of Forchoce, in the county of Norfolk, England, 95 miles distant from London, and contains 1,000 houses, and 1,023 inhabitants. It was anciently part of the possessions of the Marshalls, afterwards earls of Pembroke; from whom it came to the Morleys, and thence to the Woodhousees, in which family it is at present vested. The church, which is a handsome structure, with a large and lofty tower, was rebuilt by Remigius de Heresferre, the rector, aided by the munificence of the patron, John le Marshall, in the reign of Edward III. Several chapels and numerous images decorated the interior prior to the Reformation. In the church were held seven guilds, each having a tindipendiary chaplain serving at the respective altars constituting a choir. On the north side of the chancel is a noble canopied monument, reaching from the floor to the roof, richly decorated with fine imagery and tracery; many of the brasses are gone, but from the arms remaining it appears to have been erected to the memory of Thomas lord Morley, who died in the reign of Henry VI. Hingham has a weekly market on Saturdays, and three annual fairs. Blomefield's History and Antiquities of Norfolk.

HINGHAM, a post-town of America, in Suffolk county, Massachusetts, situated on a small bay, S. from Boston bay. It contains a number of houses, compactly built, two congregational churches, and a well endowed school. It is 19 miles S.E. of Boston. The township is about four miles square, including two parishes, incorporated in 1635, and containing 2,112 inhabitants.

HING-HOA, a city of China, of the first class, in the province of Foo-kien, near the sea-coast. It is adorned with several triumphal arches and majestic public buildings. The adjacent country furnishes rice and flax in abundance. N. lat. 25° 28'. E. long. 118° 35'.

HING-NGHAN, a city of China, of the second rank, in Che-foo, on the river Han. N. lat. 32° 34'. E. long. 108° 54'.

HINGWANG, in Natural History, a name given by the people of the East Indies to a species of red arum, which they use in painting and in medicine; they find it in and about the copper mines. It is cultivated several times, in order to fit it for internal use. In painting it makes a very fine orange-colour; but when mixed with ceruse it makes a lemon-colour, and any other shade of yellow.
HIP

It seems to contain some portion of silver, and some cinnamon.

HINIGAN, in Geography, a town of the Arabian Iraq; 100 miles W. of Belfora.

HINISBURG, a post-town of America, in Chittenden county, Vermont, E. of and joining Charlotte on lake Champlain, containing 933 inhabitants.

HINNA, a lake of Chinele Tartary, about 108 miles in circumference. N. lat. 44° 35'. E. long. 15° 29'.

HINKAN, a chain of mountains of Chinele Tartary, which reach from N. lat. 55° to 53° and from E. long. 134° to 137°.

HINOPEN STRAITS, a channel of the North sea, between North-Eastland and Spitzbergen.

HINNERJOKI, a town of Sweden, in the government of Abo; 30 miles S. of Borneborg.

HINNUSULUS, in Zoology, a hind; the young of the deer or goat kind.

HINNUSUS. See Moschus Pygmaeus.

HINNY, a furious or hybrid quadruped, the produce of the horse with the female ass. Its size is less than that of the horse, the ears and mane the same as in that animal; the colour is redder, and the tail like that of the female parent.

HINOCARES, in Geography, a town of Spain, in the province of Jaen; 15 miles S.E. of Ubeda.

HINOCOSA, a town of Spain, in the province of Leon; 25 miles N.N.W. of Civid Rodrigo.—Allo, a town of Spain, in the province of Estremadura; 16 miles N. of Llerena.—Allo, a town of Spain, in New Castile; 16 miles N. of Molina.

HINOCOSAS, Las, a town of Spain, in New Castile; 36 miles S. of Hueta.

HINSDALE, a township of America, in Cheshire county, New Hampshire, on the east bank of Connecticut river, opposite to Vernon in Vermont, incorporated in 1753, and containing 634 inhabitants; 38 miles above Northampton.

HINZUAN. See Joanna.

HIO, a town of Sweden, in West Gothland, seated on the Wetter lake, with a good salmon fishery; 80 miles N.E. of Gothembur. N. lat. 58° 20'. E. long. 15° 58'.

HIORRING, a town of Denmark, in N. Jutland, and diocese of Aalborg, formerly a large city and the seat of a bishop, with three churches; but in 1693 almost destroyed by fire, so that the bishopric was removed to Aalborg by Frederic II.; 27 miles N.N.W. of Aalborg. N. lat. 57° 27'. E. long. 10°.

HIORTED, a town of Sweden, in the province of Smaland; 60 miles N. of Calmar.

HIORTE, a small island of Denmark, near the W. coast of Taaffinge. N. lat. 54° 53'. E. long. 10° 30'.

HIP, in Architecture, a piece of timber placed between two adjacent inclined sides of a hipped-roof, for the purpose of fixing the jack rafters. For the manner of finding the length and backing of the hips, see Hipped Roof.

Hip, a particular part of an animal. See HAUNCH.

Hip, in the Materia Medica, the fruit of the corydalis shrub, wild brier, hip-tree, or dog-rofe. See ROSA Canina.

Hips are agreeably dulce-acid, and stand recommended as cooling reftringents, in bilious fluxes, sharpnesses of urine, and hot indispositions of the stomach; but they are very little used in the flops, except in the conserve, which fee.

Hip-gout, in Medicine. See SCATICA.

Hip-joint, Disease of. What is usually understood by the disease of the hip-joint, in Surgery, is a dis tally very analogous to the white swelling of other articulations. By several writers it is treated of under the name of icthyosis, which term is, however, has been mostly applied to rheumatic affections of the hip. Like the white swelling, the disease of the hip-joint probably has its varieties, some of which are undoubtedly connected with scrofula, while others cannot be fixt ined of having any concern with a traumatic habit. Mr. Crowther observes, that no cafe has hitherto occurred to him, in which the patient was not of the latter kind of constitution, although, if we understand him rightly, he adds an exception in regard to some of the cafes, which are produced by accidents. (On White Swelling, &c. p. 257, 258, edit. 2.) We believe, that, in a given number of cafes, there are more diseased hips, quite independent of scrofula, than there are white swellings of other joints. It is universally acknowledged, by all experienced surgeons, that young subjects are most liable to scrofulous diseases, and, of course, to that affection of the joints, which is commonly considered to be connected with a traumatic constitution. If a person live to the age of fifty and twenty, perfectly free from all scrofulous symptoms, the hazard of his ever becoming afterwards affected with a true scrofulous complaint may be regarded as almost entirely past. Hence, all hip affections of the joints, that occur after this period of life, and under such circumstances, cannot be reasonably considered as having any connection with scrofula.

The generality of surgical authors seem to agree, that the disease of the hip-joint is most commonly met with in children under the age of fourteen, and, in this respect, it is exceedingly analogous to the white swelling. But no age is exempt from the malady; so that, though children form a large proportion of those subjects who are afflicted, yet the number of adults, and even of old persons, is much more considerable, in a given number of these cafes, than we find to occur in the male number of cafes, in which the knee is diseased. Such is our reason for believing; that there are more hip cafes unconnected with scrofula, than there are examples of white swellings being similarly circumstanced. The observation is of course only applied to a definite number of cafes of each disease; for the much more frequent occurrence of morbid knees, ankles, wrists, and elbows, would destroy the accuracy of the remark, if taken in a general sense.

The approach of the hip disease is far more insidious, than that of a white swelling. The latter is generally preceded by severe pains; while the only fore-runner of the former is frequently a slight weakness and limping of the afflicted limb. This state is too often overlooked, and, when noticed by men little versed in the profession, is commonly treated on principles the most repugnant to surgical science. Embrocations are generally preferred, without any injunction to keep the limb in a quiet state. The application is also oftentimes made to the knee, or other part of the extremity; for as there is frequently an uneasiness about that joint, when the hip is affected, and as no pain whatever is sometimes mentioned, as occurring in the latter situation, till a more advanced period of the malady, it is not uncommon to see careless practitioners directing their remedies to some situation very different from that of the disease. This combination of neglect and ignorance is the more to be lamented, inasmuch as the incipient period of the complaint is the only one in which a favourable prognosis can ever be made, mere rest, and repeated topical bleeding, having now more effect, in the course of a fortnight, than large painful inures will afterwards generally have in the long space of a twelvemonth.
The first diagnostic symptoms of disease in the hip-joint, if we merely look for them in the situation of that articulation, are not particularly conspicuous. It is true, that a fixed pain behind the trochanter major, in some instances, very soon excites the attention of the surgeon to the seat of the morbid affection. But mere pain in a joint, quite free from visible enlargement, and external change of colour, is generally disregarded as a complaint of no importance in young subjects, and as a mere rheumatic, or gouty affection in adults. Even when the pain begins to be severe, it is commonly not confined to the seat of the disease, but shoots downward, in the course of the vastus externus muscle, to the knee, and along the outer part of the fibula to the malleolus externus. The patient often refers most of his painful sensations to the groin. In short, there is no particular symptom occurring in the precise situation of the morbid affection, so as to form an infallible pathognomonic mark of its existence. But still the characters of the disease are very strong, when examined by a surgeon, who has paid attention to the subject.

Almost as early as the leafy limping can be perceived, some diminution in the circumference of the leg and thigh has actually taken place, as may be easily discovered by a careful measurement.

The hip-joint is deeply situated, so that its accidents and diseases cannot be examined as readily as those of many other articulations. The generality of surgeons little think, that the proper place for pressing on the hip-joint, with a view of ascertaining the presence of disease, is a little on the outside of the femoral artery, soon after it has descended below the brim of the pelvis. At this spot, the surgeon may apply pressure to the front of this large articulation, and if it be diseased, considerable pain will be the consequence of the experiment.

The limping gait denotes, that something is wrong in the limb, and if this symptom cannot be attributed to an affection of the vertebrae, or a recent accident; and if it be conjoined with the above-mentioned emaciation of the affected member, an exacerbation of pain on pressing the front of the acetabulum; the evidence of disease in the hip becomes more and more convincing. It has appeared to us, that the weakness of the lower extremities from diseased vertebrae always affects both limbs at once, and is unattended with pain about the knee, circumstances completely discriminating this complaint from the feebleness of the limb, arising from the dislocated state of the hip-joint.

The marks of differentiation, just pointed out, between two diseases of so different a nature, may appear to some persons quite superficial. We entertain an opposite opinion. The disease of the vertebrae, and the affection of the hip, are both in the incipient state often attended with little else than a certain weakness in walking, at least with no other symptom, which would strike an uninformed person. Almost every surgeon must have seen many cases in which the vertebrae are diseased, and attended with more or less lameness, without there being any preternatural projection of the spinous processes whatsoever. Such projection, indeed, from the nature of the changes going on in the bones, can never happen, till the disease has made considerable advance. Besides, it is a well known fact, that some practitioners are either so negligent, or ignorant, that they never advert at all to the condition of the back, as the seat of lameness. How many cases have we seen, in which children's legs have been rubbed with liniments, while their backs were never examined, nor suspected, as being the seat of the primary disease, to which the paralytic weakness of the limbs was entirely owing. If Mr. Crowther's assertion be true, that in cases of diseased vertebrae, one limb is little affected with lameness, while the power of the other is much impaired, the necessity for every sign of discrimination will be still greater, because when the spinous processes do not project, as is often the case at first, a serious lameness on one side will be the only one particular complaint, both in disease of the spine and of the hip. The observations, however, which we have made, by no means justify the conclusion, that either in the early or advanced period of the dilitemps of the vertebra, one leg is always, or even generally, affected with little lameness in comparison with the great weakness of the other.

But whether there are exceptions, in which one limb suffers so much more than the other or not, has nothing to do with the fact advanced, that in cases of diseased vertebrae, both limbs are affected with weakness. The projection of the spinous processes is, in the earlier periods of the disorder, far less variable.

Another remarkable symptom of the disease of the hip, in its early stage, is an elongation of the limb, a circumstance, which is quite manifest, on comparing the condyles of the os femoris, the patella, the trochanter major, and the malleolus internus of the diseased limb, with the same parts of the found one.

Until lately, no satisfactory explanation had been given, by surgical writers, of the manner in which the lengthened state of the limb was produced in the early stage of the hip disease. "The ancients, and, indeed, many practitioners, even of modern times, have alligned as causes of the increased length of the limb, a supposed relaxation of the orbicular ligament, or a dilatation of the articular cavity by fluid effused into the capsule. Such are the notions brought forward by Galen and Fabricius, to illustrate the meaning of the two aphorisms of Hippocrates, concerning the nature of this disease." Sæpe in articulis humor pituitosus accrescat, quem myxam appellat, (Hippocrates,) a quo madefa articulationis ligamenta, laxiora redduntur: atque idea facilis a cavitate articulatis excitid, et ruribus non cum difficulitate incidit. Galen in Aphor. Hippocr. Comm. 6. See Crowther on White Swelling, &c. p. 259. edit. 2.

We shall pass over the erroneous opinions, that the limb is lengthened by a dilatation and relaxation of the orbicular ligament, or by a swollen state of the head of the thigh-bone, and a thickening of the acetabulum, or in consequence of a diminution of the articular cartilages, and of the ligament completing the lower and inner margin of the acetabulum. In short, nothing can be more certain, than that while the elongation of the limb lasts, the head of the bone must be situated in the acetabulum, or else the muscles would draw the bone upwards, and shorten the member, as we find actually occurs as soon as the upper and posterior part of the acetabulum, and the ligamentum teres are so destroyed, that they make no resistance to this kind of dislocation.

If then the head of the bone does not quit its situation, the lengthened state of the limb can depend upon nothing less, than an alteration in the position of the pelvis. That the pelvis does undergo a change of its posture is now perfectly ascertained. The publication in which this fact was first noticed, we believe, is Dr. Falconer's pamphlet on ichias. "The tubercle, or lower part of the ilium may, in many instances, but not always, be discovered by feeling it behind to be lower on the affected side than the other. A man, now in the hospital, is a remarkable instance of the difference between the height of the bones on each side; and a pelvis of a person who died at the same place, and was preferred there many years, shewed it still more strongly."
HIP-JOINT.

pears, from some remarks in Mr. Crowther’s work on the white swelling, that Mr. John Hunter used to attribute the lengthening of the limb to the situation of the pelvis. Mr. Crowther and Mr. Lawrence instituted together an examination of this point, upon two children with diseased hips, and they ascertained, that when the patients were laid on the table, with the whole body in a straight line, the anterior superior spinoous processes of the ilium on the affected side was lower than that of the found one, just in proportion to the difference in the length of the two limbs; this was about a quarter of an inch in one patient, and a full inch in the other. A similar obliquity of the pelvis was equally manifested from behind, when the patients were placed on the abdomen, with the precaution of laying the body in a straight line. It was impossible to place the pelvis in its natural horizontal position, without bringing the body into a curved line, and when this was done, the lower extremities, instead of falling straight under the body, deviated from the perpendicular towards the diseased side. A straight line drawn along the spinoous processes of the sacrum, and continued downwards, did not fall between the lower limbs, as it would in a pelvis, possessing its natural position, but, on the contrary, extended to the heel of the found limb. Mr. Crowther thinks, that in these cases, the obliquity of the pelvis can be ascribed to no other cause, than that of the patient’s endeavouring to throw the weight of the body, as much as possible, on the found hip. The pain, and the general weakness of the affected limb, induce a constant effort of this kind. Hence children are observed bending the knee and hip, and hopping around on the healthy limb. The pelvis naturally sinks on the diseased side, and this deviation, which would affect the centre of gravity of the whole body, is counterbalanced by a bend of the upper parts of the trunk towards the found side. Accordingly, both the patients under Mr. Crowther were noticed to incline their heads towards the shoulder of the sound side of the body.

Another remarkable symptom which attends the disease of the hip-joint, is the alteration in the natural fulness and convexity of the nates, that part appearing flattened which is usually most prominent. The glutaeus magnus becomes emaciated, and its edge no longer forms to hold a line, as it naturally does, at the upper and back part of the thigh, in the found state of the limb. This is one very strong feature of the early state of the disease, and has been accurately represented in one of the plates of the late Mr. Ford’s book on the present subject.

Though there may be more pain about the knee than the hip at some periods of the malady in its incipient state, the former joint may be bent and extended without any increase of uneasiness; but the thigh-bone cannot be moved without a rack increas of the patient’s sufferings.

Patients with diseased hips soon get into the habit of bearing the weight of the body chiefly on the other limb, so that they bend the thigh of the affected side forwards, in order to touch the ground only lightly with the foot. This is at all times found to be the most easy position of the limb, and every attempt to put the member in a straight posture gives considerable pain.

Such is the first stage of the disease in its ordinary form, in which we generally find the health little disturbed.

When the hip is touched, the patient does not in general suffer any particular pain, unless the pressure be applied to the front of the joint, the part which is undoubtedly the most superficial. Yet it deferves notice, that a few instances do occur, in which all the soft parts surrounding the joint are tense, exceedingly painful when handled, and in which the intertendums are even tinged with a light pink colour.

It remains for us to describe the second stage of the disease, or that which is attended with suppuration.

The symptoms which are the forerunners of the formation of pus, are different in different cases. This variety depends upon the presence of acute or only chronic inflammation. When the former occurs, the parts surrounding the joint become tense and extremely painful; the skin is even reddish, and the patient experiences an attack of inflammatory fever. As the local pain abates, rigs take place, a swelling forms in the vicinity of the joint, and very few points.

When the abscess is the consequence of that languid kind of inflammation which usually occasions serofulous collections of matter, there is not so remarkable an increase of pain in the articulation, before the commencement of suppuration. Startings and other spasmodic complaints have been let down as the most certain signs of the formation of matter in this diseaf. When the pus is formed in this flow manner, it does not make its way to the surface of the body so quickly, as when the abscess has been the immediate result of an attack of active inflammation on the morbid joint. A large fluctuating tumour presnts itself; but it does not directly point. The patient sufferers greater uneasiness in the part; yet its sensations do not amount to that acute description of tenderness, which affects in the foregoing instance not only the deep, but also the most superficial parts around the articulation.

At length the limb becomes shortened, and this circumstance, when the retraction is very considerable, arises from nothing else, than an actual dislocation of the head of the thigh bone, in consequence of the distruption of the cartilages, ligaments, and articular cavity. The shortening of the limb may happen before suppuration as well as after it. There are instances, in which the head of the bone is dislocated, and ankylosis ensues without the occurrence of any abscess at all.

Sometimes, before matter is formed, the patient is seriously dejected by hectic symptoms. In the suppurative stage of the disfemper, these effects on the constitution always become worse. The patient loses his appetite, cannot sleep, has a small frequent pulse, colloquative sweats; and, too often, a very obilimate and debilitating diarrhiea.

The openings through which the abscess is discharged continue, in most instances, to emit an unhealthy kind of matter for a long time after their first formation, becoming in fact the terminations of sinuies, which lead down to the diseased joint.

When the disfem follows external violence, the inability of using the limb is laid by Sabatier not to be fo complete, as when that symptom depends upon a fracture of the neck of the thigh bone; a circumstance, which may affrit the judgment of the surgeon in any doubtful case.

When a diseased hip is examined after death, collections of matter are often seen on the glutaei muscles, on the dorsum of the os ilium, and in the acetabulum. Sometimes, the muscles at the upper and fore-part of the thigh are covered with sinuies. The femur is frequently found drawn up on the external surface of the ilium. The cartilage which covers the head of the thigh bone is occasionally quite destroyed, while the round ball itself is marked with deep excavations, the extent of caries. The acetabulum is often totally destroyed, so that the os femoris, not being confined in the articular cavity, is pulled upwards by the muscles. Even the outside of the ilium is sometimes affected with a kind of caries.

According to Mr. Ford, the os innominatum is always more
more extensively curios than the thigh bone. We have seen a case, where the head of the latter bone was quite perfect, notwithstanding the acetabulum was completely annihilated. If this statement be generally, or even frequently correct, it must refute the doctrine of De Haen, that the diastemaper begins in the soft parts, at the same time, that it displays the absurdity of all thoughts of undertaking amputation at the hip, since most of the disease, situated on the bones of the pelvis, could not be taken away.

The remote causes of the hip disease are very imperfectly understood. External violence is undoubtedly one, and the testimony of numerous respectable writers confirms, that lying down on the damp ground in summer time, and, indeed, all kinds of exposure to damp and cold, are frequently conducive to the origin of the disorder. For this reason, the lower orders of society are rather more subject to the affection than the higher classes. The particularities, however, in the affected joint, or, in the constitution, which cause the disease to take place in some persons, and not in others, though similarly circumstanced in life, are perhaps beyond the reach of human investigation. A scrofulous habit is certainly one predisposing circumstance; but the disease often takes place without any suspicion of scrofula, and without any palpable cause whatever.

When the disease is attended with a degree of active inflammation, the most advantageous treatment is topical bleeding with leeches, cupping the circumference of the affected joint, and applying the fumitory lotion. When the pain is feverish, the hip may be fomented in the morning and evening, and an opiate may be administered at night. Care must be taken to keep the bowels open with mild purgatives.

The foregoing plan is always highly beneficial, while there are manifest marks of active inflammation about the joint. But it is not to be continued after such fatse has subsided. Morbid anatomy tends to shew, that the hip disease consists in the same alteration of the bones, ligaments, and cartilages, as we find prevalent in the generality of white swellings. Experience proves, that both diseases ought to be treated on similar principles. The plan, therefore, on which the belated surgeons place the greatest reliance, is the endeavour to stop the progress of the disease by making an incision with caution just behind and below the great trochanter. This fissure is to be kept open with a point. The benefit which it effects, is accomplished not merely through the discharge that is produced, but also on the principle of counter irritation. For nothing is more certain in medical science, than the frequent possibility of arresting and subduing one disease by the artificial formation of another. In general, it will be requisite to keep the incision open for several months, or even a year or two, before the dilatation is effectually checked. During all this time, the patient should be advised to reft the limb as much as possible.

The efficacy of the Bath water, in the cure of the hip disease, has been much praved by Drs. Oliver, Charlton, and Falconer. The patient is put into a warm bath for 15 or 25 minutes, two or three times a week. It is to be noticed, that the Bath water is only recommended as an external application, and merely in the early stage of the disease, before suppuration has commenced. We felicit, that many cases, which have been let down as cured by the Bath water, have been rheumatic affections; and we believe that any warm bathing would have had equal power over the hip disease.

When abscesses form, the surgeon should let out the matter, and apply a poultice. The incision, however, is not to be discontinued; or, if the inflammation or any other circumstance should compel the surgeon to heal it for a time, it will be proper to make another as soon as the joint is in a more easy state. We scarcely need observe how necessary it is to support the patient's strength with tonics, good air, eligible nourishment, &c. when hectic symptoms prevail. Pain is to be appeased, and sleep procured by opium. See Ford on the Disease of the Hip-joint, Falconer on Ichias, Crowther on White Swelling, edit. 2. Samuel Cooper on the Diseases of the Joints.

HIP-mould, in Building, is by some used for the back of the hip. Others understand it as a prototype, or pattern, commonly made of a piece of thin snowfot, by which the back and the sides of the hip are let out.

HIP-joint, a disorder of the horse, when he has wrung or strained his haunches or hips, so as to relax the ligaments that are to keep the bone in its due place. The signs are, that the horse will halt much, and go sidelong, trailing his leg after him; and the hip which is hurt will be lower than the other, the flesh falling away on the side of his buttock.

HIP-tiles. See TILES. HIPPA, in Zoology. See CANCER.

HIPPAGOGA, in Antiquity, a vessel used in transporting horses. It was otherwise called hippago.

HIPPARCHION and RUFINUS, in Biography, celebrated performers on the lyre, meeting in contention for the prize at the public games. Hipparchion was fo terrified at the sight of the crowd in the theatre, that he was utterly unable to dispute the premium, which was bestowed on Rufinus. Hence the name of Hopparchion became proverbial for any one who promised much, and performed nothing.

HIPPARCHIA. See Crates.

HIPPARCHUS, an ancient astronomer, was born at Nice, in Bithynia, and flourished between the 154th and 163d Olympiads. He was the first person who attempted to count the number of the fixed stars; and his catalogue is still preserved in Ptolemy's *Almagest,* where they are set down with their latitudes and apparent magnitudes. According to Pliny he foretold the course of the sun and moon for 600 years; he predicted the times of eclipses, and taught mankind that they ought not to be alarmed at the recurrence of such phenomena. Thales was the first among the Greeks who could forecast the approach of an eclipse; and among the Romans, Sulpius Gallus began to be useful in that kind of prediction, and he made a memorable effort of his skill on the night before the day in which the decisive battle against Perseus was fought. Hipparchus came after these, and greatly improved that science, making ephemerides, and other learned and useful helps to the practice of astronomy. He discovered a new star; and he is memorable for having been the first who discovered the PRECESSION OF THE EQUINOXES, which see. He endeavoured to reduce to rule the many discoveries which he had made, and invented new instruments by which he marked the places of celestial objects, and their magnitudes. Hupparchus made his first observations in the isle of Rhodes, but he afterwards pursu'd his studies in Bithynia and Alexandria. His commentary upon the phenomena of Aratus, which is a kind of criticism on that poem, is still extant. This commentary was first published by Peter Victorinus at Florence, about the middle of the 16th century; but a more correct edition of it was given by father Petavi, with a Latin version and notes, in his Uranologie, published at Paris, 1635.

Hipparchus was author of many other works, which were highly spoken of by the ancients, but which are now lost. Every man of science has without hesitation agreed in rendering a just tribute to the praise of this astronomer, on account of the obligations which this kind of knowledge is under to him. He is likewise celebrated for his ardent patriotism and public spirit, under the influence of which he
is said to have been greatly instrumental in delivering his country from tyranny. He is thought to have died about 125 years before the Christian era, and statues were erected to his memory. Bayle. "Hutton's Math. Diet."

HIPPARCCHUS's Period. See Period.

HIPPASUS, in Biography, is enumerated among the Greek writers on music whose works are lost. He was a native of Metapontus, a disciple of Pythagoras, and, according to Theon of Smyrna, an excellent musician.

HIpped Roof, in Architecture, is that whose ends rise immediately from the wall plate, with the same inclination to the horizon as the other two sides of the roof have.

Backing of a hip is the angle made on its upper edge, to range with the two sides or planes of the roof between which it is placed.

Jack rafters are those short rafters fixed to hips equi-distantly disposed in the planes of the fides and ends of the roof, and parallel to the common rafters, to fill up the triangular spaces, each of which is contained by a hip rafter, the adjoining common rafter and the wall plate between them.

The front or base of the rafter is its ichnographic projection on the plane of the wall-end, or on any other horizontal plane.

The principal angles concerned in hipped roofing are, the angle which a common rafter makes with its seat on the plane of the wall-end; the vertical angle of the roof; the angle which a hip makes with the adjoining common rafter; the angles which a hip make with the wall plate on both sides of it; the angle which a hip rafter makes with its seat; and the acute angle which a hip rafter makes with a vertical line.

The principal lengths concerned are, the height of the roof; the length of the common rafters and their seats; the length of the hips and their seats; and, lastly, the length of the wall plate contained between the lower end of a hip and the lower end of the adjacent common rafter.

The fides and angles may be found by geometrical construction or trigonometrical calculation. It is evident, that if the hipped end of a roof be cut off by a vertical plane parallel to the wall, through the upper extremity of the hips, it will form a rectangular pyramid, or one whose base is a rectangle. The base of this pyramid is bounded by the wall plate between the two hips on one side, and on the opposite side by the feet of the two adjoining common rafters; on the other two opposite sides by that part of the wall plate on each side contained by the lower end of the hip and the next common rafter adjoining. One of the fides of this isosceles triangle contained by the two adjoining common rafters with their seat; the opposite fide is the hipped end of the roof, forming also an isosceles triangle; the other two opposite fides are the right-angled triangles contained by the two hips and the two adjoining rafters on the side of the roof. This rectangular pyramid may be divided into three triangular pyramids by the two vertical triangular planes, formed by the hip rafters, their seats, and the common perpendicular from their vertex.

Two of these pyramids, when the plan of the building is a rectangle, are equal and opposite. In each of these equal and opposite pyramids the base is a right-angled triangle, contained by the seat of the hip rafter, the seat of the adjoining common rafter, and the part of the wall plate between the hip and the adjoining common rafter. One of the fides is a right-angled triangle contained by the adjoining common rafter, its seat, and perpendicular; a second fide is a right-angled triangle contained by the common rafter, the hip rafters, and the wall plate between them; and the remaining third fide is the triangle contained by the hip rafter, its seat and perpendicular.

With regard to the remaining pyramid, its base is a right-angled triangle contained by the seats of the two hips and the wall plate between them, the right angle being that contained by the seats of the two hips; two of its fides are the triangular planes passing the hip rafter, which are also common to the other two pyramids; its third fide is the hipped end of the roof.

Given the plan of a building, or the form of a wall plate of a hipped roof, and the pitch of the roof, to find the various lengths and angles concerned, whether the roof is square or bevel.

To find the Length of the Rafters Geometrically.—Let ABCD (Pl. LXXV.) be the plan. Draw EF parallel to the sides AD and BC in the middle of the distance between them. On DC, as a diameter, describe the semicircle DFC. Draw FD and FC, then the angle DFC is a right angle. Draw GFH perpendicular to EF, cutting the fides AD and BC in G and H. From EF cut off GI equal to the height or pitch of the roof, and join GI. From FC cut off FK equal to GI, and join KD; then GI is the length of a common rafter, and DK that of the hip; and by turning the point F, G, and F, until their planes become perpendicular to the triangle GFD, the perpendicular FI will coincide with FK, and the point I will coincide with the point K; the lines GI and DK, representing the rafters, will then be, in their true position.

The fame by Calculation.—GI \(= GF^2 + FI^2 \) (Euclid I. 47), therefore GI \(= (GF^2 + FI^2) \) \(\frac{1}{2}\) the length of the common rafter, \(DF = GF^2 + DI^2\) the square of the length of the hip. DK \(= DF^2 + FK^2 = GF^2 + GD^2 + FI^2\). therefore \(DK = GF^2 + GD^2 + FI^2\).

In the same manner the other hip rafter CL is found, as also the hip rafters AM and BN.

To find the Backing of the Hips and the Shoulders of Jack Rafters and Purlins.

Geometrically.—Let it be required to find the backing of the hip rafter, whose seat is CF.

Imagine the triangle CFI to be raised upon its seat CF, until its plane becomes perpendicular to the plane of the wall plate ABCD, then there will be two right-angled fold angles; the three fides of the one are the plane angles FCD, FCL, and the hypothenus or plane angle DCL. In each of these fold angles the two fides containing the right angle, viz. the plane angles FCI, FCD, and the perpendicular plane angle CFL, which is common to both, being given, to find the two opposite inclinations to the fides FCI and FCD, and the remaining third fide.

Now the angles GDC and HCD are bisected by the fides FD and FC of the hip rafters; for if EF is produced to meet DC in U, U will be the centre of the circle DFC; and UC, UF, UD, are equal to each other; and because UF is equal to UC, the angle CUF is equal to FCU; but CUF is equal to the alternate angle FCD; therefore the angle CUF is equal to FCD; that is, the angle UCH is bisected by the seat FC of the hip rafter. In the same manner it may be shown that UDG is bisected by the seat DF of the other hip rafter. From any point O in FC, draw OV perpendicular to LC, cutting it in P, and OW perpendicular to FC, cutting DC in W; from OC cut off OQ equal to OP. Join OW, then OOW will be the inclination opposite the plane angle
angle FCU, and this is the angle which the end of the roof makes with the vertical triangle contained by the hip rafter, its foot and perpendicular. Produce WO to meet BC in X, and join QX, when WOX is the inclination of the two planes of a side, and end of the roof, whose intersections are BC and CD, on the plane of the wall-head. Now the angle WOX, which is double the angle WQO, is the backing of the hip. Make PV equal to WQ, and join CV, then will PVC be the angle contained by the two sides LC, CD or that of the hypothenusal plane angle contained by the intersection BC, and the hip rafter LC. This angle may be otherwise found thus: produce GH to R; make CR equal to CL, then the angle HCR is equal to PVC. Now the angle HCR, or PVC, is the angle which the purins (when one of their faces is in the side of the roof) makes with the hip rafter LC; and the angle CVP, or CRH, is the angle which a jack rafter makes with the same hip: in the same manner may the backings of the other hips be found. The other bevel of the jack rafters is the angle HIF. To find the other bevel for cutting the shoulder of the purlin proceed thus: as in F, as a centre, with the distance FG, describe the arc GY; draw FY perpendicular to GI; YZ parallel to EF, cutting FD in Z, and ZF parallel to GF, cutting AD in &. Join &F, then G & F is the angle which the other side of the shoulder makes with the length of the purin.

At the upper end of this diagram is shown the manner of finding the two bevels for cutting the shoulder of the purin against the hip rafter, when the side of the purin is not in the plane of the side of the roof.

To find the same thing by calculation.—The backing of the hip rafter, and hypothenusal side, is obtained as follows: it has been shown that the three plane angles, and the three inclinations of solid angles, containing three plane angles, are found exactly as the sides and angles of spherical triangles, any three parts being given; the degrees of the plane angles being exactly the same as the sides of the spherical triangle, and the inclinations the proper measures of the spherical angles: therefore if two of the plane angles should be perpendicular to each other, the spherical triangle representing this solid angle will have also two of its sides perpendicular to each other. Now in this, there are given the two sides containing the right angle to find the hypothenuse and angles.

It is shown by writers on spherical trigonometry, that in any right-angled spherical triangle, radius is to the cosine of either of the sides, as the cosine of the other side to the cosine of the hypothenuse. Suppose the plane angle FCL to be 27°, and the angle FCH 52°, to find the hypothenuse and angles of a right-angled spherical triangle, one of whose legs is 27° and the other 52°, it will therefore be

As radius, fine of 90° = 10.00000
Is to the cosine of FCL, 27° = 9.94988
So is the cosine of FCH, 52° = 9.78793

\[ \frac{19.73922}{10.00000} \]

To the cosine of the hypothenuse \[ 56° 44' \] = 9.73922

This ascertains the angle which the jack rafter makes with the hip. Since all the sides are now given, we shall have, by another well known property of the sides of the sides being as the sines of the opposite angles, the following proportion,

As the sine of the hypothenuse \[ 56° 44' \] = 9.02227
Is to the sine of a right angle, or \[ 90° \] = 10.00000
So is the sine of the side FCH, 52° = 9.89553

\[ \frac{19.89553}{9.02227} \]

To the sine of the opposite angle \[ 70° 28' \] = 9.97426

Therefore the backing is twice \[ 70° 28' \] = \[ 140° 56' \]

In finding the angle opposite the side FCH, it was not necessary that the hypothenusal side should have first been found, it might have been found independently thus: the sine of either of the sides about the right angle is to radius, as the tangent of the remaining side is to the tangent of the angle opposite to that side; therefore

As the sine of the side FCL, 27° = 9.65705
Is to the tangent of the side FCH, 52° = 19.89071
So is radius, fine of 90° = 10.00000

\[ \frac{20.10719}{9.65705} \]

To the tangent of the angle opposite the \[ \text{side FCH} \], \[ 70° 28' \] = 10.45014

In the same manner may other bevels be found by trigonometrical calculations; but as such extreme exactness is not necessary, the geometrical constructions ought to be well understood.

HIPPELAPHUS, among the Ancient Zoologists, was only the name of a large race of frogs with longer hair on the neck, giving it the appearance of a mane. See Cervus Elaphus.

HIPPER RIVER, in Geography, is a small river which rises in the East Moors of Derbyshire, in the township of Brampton, and falls into the Rother at the S.E. end of the town of Chesterfield. This river collects all the rain waters of about 7000 acres of land, according to Mr. Farcy's Report of Derbyshire, vol. i., where the firths are mentioned over which it flows. A great variety of manufactures are established on this river in New or Little Brampton and Chesterfield.

HIPPEUS, or Equinus, in Physiolog, a sort of comet which some writers suppose to bear a resemblance in its tail to a horse. But the shape of this kind of comet is not always alike; being sometimes oval, and sometimes imitating a rhomboid. Its train also is sometimes spread from the front or fore-part, and sometimes from the hind-part.

Hence this class of comets is distinguished into equinus barbarus, equinus quadrangularis, and equinus ellipticus. See Comet.

HIPPI PROMONTORIUM, in Ancient Geography, Rari-Hemath, a promontory of Africa, E. of the promontory of Tapanus, and N.W. of the promontory of Stoborrum.

HIPPIA, a town of Greece, in Thessaly, in Perrhebia. —Also, a fertile and delightful level country at the mouth of the Cephisus.

HIPPIA, in Botany, a name which seems to have originated with Valerius Cordus for the common Chickweed, Stellaria media, Fl. Brit. See his Hist. Strp. 159. It is said by Ambrosius to be derived from iseo, a horse, because it affords
Hippia.

Gen. Ch. Common Calyx hemispherical, of several ovate, somewhat imbricated, scales. Cor. compound, diluid; with numerous male florets in the disk, and ten female ones in the circumference; the petal of the male is funnel-shaped, five-cleft, crept; that of the females obsolete, tubular, slightly three-cleft. Stam. Filaments in the male florets five, very short; anthers fill shorter, united into a cylinder. Pyl. Genuae in the female florets large, bordered; style cloven; stigma erect. Peric. none, except the unchanged calyx. Seeds in the female florets oval, encompased all round with a very broad margin, without any crown. Recap. naked.

1. H. fruiticosa. Linn. Mant. 291. Suppl. 390. (Tanacetum fruiticosum; Linn. Sp. Pl. 1183, Ti. africanum aromatereons, folis lavandulae multitudo folio; Comm. Hort. v. 2. 211. t. 101.)—Shrub, erect, and hairy. Leaves pinnatifid. Flowers corymbose. A native of the Cape of Good Hope, flowering in our greenhouses from February to August, and sometimes perfecting seed in the autumn. The whole plant is clothed with soft flabby hairs, especially the young leaves and branches, and has the smell and taste of common Tanphi. Stem shrub, round, alternately branched, leafy, five or fix feet high, with a brown bark. Leaves scattered, stalked, an inch or inch and half long, deeply and elegantly pinnatifid, their segments numerous, parallel, elliptical, entire, decurrent into the stalk. Flowers terminal, corymbose, deep yellow, like Tanphi, but smaller. The chief beauty of the plant consists in its foliage, which is so regularly cut as to be almost pectinate. Indeed Linnaeus, thinking it at one time an Ericophyllum, named it E. petrophilus in his Sp. Nat. ed. 12. v. 2. 579.

2. H. minuta. Linn. Suppl. 389.—Herbaceous, procumbent, creeping. Leaves pinnate. Flower-stalks axillary, single-flowered.—Sent by Mutis from New Granada. Root of very long fibres. Stems procumbent, creeping, a few inches in length, branched, round, hairy. Leaves opposi- te at the base of the branches, otherwise alternate, scarcely an inch long, pinnate or very deeply pinnatifid, their leaflets or lobes much resembling those of the former species, but sometimes having one or two notches. They are hairy when young, nearly smooth when full-grown. Flower-stalks rather longer than the leaves, sheathing and membranous at the base. Flower-stalks axillary, longer than the leaves, deflexed, simple, slender, naked, solitary, each bearing an extremely small yellowish flower, of the difficulty of examining which the younger Linnaeus might well complain; but he has copied his father's manuscript from the back of the specimen, and possibly the whole was written by the latter, as was the case with the greater part of the Supplementum, though published in the name of the former. We have already pointed out a mistake into which Luffiue has been led respecting this plant. See Gymnystyles coryphifolia.

3. H. johnii. Broter. Lufit. v. 1. 373. Phytogr. falc. t. 29. Willd. n. 3.—Herbaceous, procumbent, creeping. Leaves pinnatifid. Flowers feble at the root.—Frequent in Portugal, according to the worthy father Brotero, growing in moist ground, especially where the soil is chalky, and flowering in winter, sometimes as late as April. The plant is inoffful and inodorous. Root annual, fibrous, crowned with the feble flowers, and throwing out from beneath them a few flouts, scarcely above half an inch long. Leaves copious, radical, spreading in a circle, smooth or slightly downy, pinnatifid with five, seven, or only three lobes, which are very small and linear-lanceolate. Flower-stalks from half an inch to an inch long, being twice the length of the leaf, or more. Flores enveloped in down, all tubular; the females 40 or more, in the circumference; males seven or eight only, in the centre. Corolla of the females awl-shaped or briddle-like, closely embracing the style, with a scarcely perceptible limb; that of the males funnel-shaped, apparently three-cleft. The flutes of the former all meet over the male florets in the centre, while the flower is in perfection. Seeds numerous, smooth, wedge-shaped, or ovovato-rectangular, the upper angles pointed; crowned with the style and a membranous partial calyx, without down, and winged longitudinally.—Such are the most important circumstances in Brotero's description, which certainly prove the plant a Gymnystyles, under which genus we should have ranged it, had this account come under our notice before. It does not appear to be any of the species we have described, but makes a fourth, and the only European one. We have not however seen any specimen.

4. H. integrifolia. Linn. Suppl. 389. (Grangeaa; Lamarck. Illfr. t. 609. f. 1.)—Roughish, upright. Leaves lyrate, unequally ferrature; the upper ones undivided. Flowers in terminal clusters.—Native of the East Indies? Our specimen came from the Paris garden, as the Grangea of Jussieu and Adanson; we have already alluded to it under the first species of that genus; (see Grangea;) but were not then aware of its being figured as such by Lamarck. The original specimen, named by the younger Linnaeus, is very bad, and the leaves were not perceived by him to be ly- rate. He not unaptly compares them to those of annette, which their deep unequal ferratures resemble. The stem is herbaceous, a foot or two high, roughish. Leaves alternate, stalked, two inches long and one broad. Flowers the size of a small pea, in loose, terminal, erect clusters; their florets very nume- rous; receptacle convex; seeds obovate, bordered. We are certain this plant is not a Grangea, but dare not aver it to be a good Hippia, though we see no positive objection. The seeds indeed are much narrower than in H. fruiticosum.

5. H. bicolor. (H. integrifolia; Ait. Hort. Kew. v. 3. 278. Sphenanthera africana; Bum. Ind. 187. t. 62. f. 2, but not of Linnaeus; Cutila bicolor; Willd. Sp. Pl. v. 3. 2717, excluding the synonym of Lamarck.)—Roughish, spreading. Leaves obovate, deeply ferrature. Flowers in terminal, divaricatated, leafy clusters.—Native of the East Indies. We had it (as the plant adopted by Willdenow from Roth,) out of the lobe of the Cambridge garden in October, 1805, and have no doubt of the synonymy of Bumam and Aiton. It appears sufficiently distinct from the last described in its spreading mode of growth, paler colour, differently shaped and less divided leaves, whole ferratures are more pointed, and in the divaricatated clusters. In genus it certainly accords with the integrifolia, which name would suit the present species better than that to which it is applied. S.

HIPPIAI, in biography, a philophor of Elia, and a discip.
HIPPION, in Botany, a name synonymous in some authors with Horfe Violet, derived from Pericarp, a horfe but for whose application in the present infence we cannot account. It is retained by Schmidt in his Flora Boemica, after Geffer, for the Gentiana with a bearded corolla, of which he makes a distinct genus. Mr. Brown, however, Prodr. Nov. Holl. v. 1. 450, quotes the Hippion of Schmidt as a synonym of what he confiders as the real Gentiana, whose corolla is nated at its orifice.

HIPPION, in Antiquity, that part or tract of the hippopodrome which was beaten with the horse's feet. See Hippodrome.

HIPPO DIARRHYTON, OR ZYGUS, IN ANCIENT GEOGRAPHY. See Bisaeta.

Hippo-Regius, an ancient town of Africa, in that part of Numidia called the Eastern province or Conflantia, situated near the sea, on a bay in the vicinity of the promontory of Hippo. The ruins of this ancient city are spread over the neck of land that lies between the rivers Boo-jeeara and Sebonufc, which near the bank is plain and level, but rises afterwards to a moderate elevation. They are about half a league in circuit, confifting of broken walls and cellars. This city was called Hippo Regius, not only in contradiftinction to the Hippo Zygus, but from its having been one of the royal cities of the Numidian kings. For Silius Italicus (L. iii. v. 259.) informs us, that it was formerly one of their favourite seats; and indeed if a city strong and warlike, commodiously situated, as well for commerce as for hunting and diversion, that enjoyed a healthful air, and took in at one view the sea, a spacious harbour, a diversity of mountains loaded with trees, and plains interfered by rivers, would fix the affection and attachment of the Numidian kings, Hippo had all these circumstances to recommend it.

HIPPPOBOSCA, in Entomology, a genus of the Diptera order, distinguished by having the mouth furnished with a short, strait, and cylindrical two-valved fucker, the valves of which are equal; the antennae filiform; feet armed with numerous claws, and the body flat and hard. This is the Linnean character, to which it is added by Scopoli that the rostrum has only one bristle. Geoffroy oberves, that the hippopofeae are the only dipterous insects that want fleamata, except the culicines, and that their antennae are fetaeous, and composed of a tingle hair. According to Scheffer the abdomen is as broad as the thorax. Fabricius adopts the genus as proposed by Linnaeus, with the following effential character. Beak short, strait, and bivalve, with the valves equal, and the antennae filiform; adding, as a Secondary character, that the body of the hippopofeae is small, ovate, depressed, flat, glabrous, and immarginate: the head small, rounded, and flat: the eyes ovate, lateral, and dilatant; thorax ovate; fculet large; and the wings two, membraneous, and the length of the abdomen.

The hippopofeae are denominated "Spider flies" by some English writers, no doubt in conformity with the French of Reaumur, "mouches araignées." This is not a name, however, by which they are exclusively known in France, being called in Normandy "mouches bretonnes," and elsewhere "mouches d'Espagne." In England also they bear the name of horfe-flies, the largest species being extremely troublesome to hores. They haunt woods and marly places, and are commonly found attached to the bodies of quadrupeds and birds, the blood of which affords them their natural sustenance. In the act of feeding they thrall their acute probofeis into the skin, and occasion a smarting sensation, similar to that inflicted in the bite of a flea, but rather more pungent. They move sluggishly, and with caution, and are at all times to firmly attached to the skin by the affilience of their numerous claws, that it is scarcely possible by any effort to remove them, unless by at the same time plucking out the feet to which they adhere. The species are not numerous.

Some modern writers divide the hippopofeae into three different genera, retaining to one the former term, and naming the other two Ornithomyia and Melophagus. The very close affinity the two first mentioned bear to each other in external appearance seems scarcely to allow a division so remote from the example of Linnaeus and Fabricius as that proposed, and we rather with to esteem them as two distinct families of the same natural tribe than as distinct genera: the difference that prevails in the structure of the antennae in those two families is certainly remarkable, and the very peculiar distinction of the head is also to be considered, one having fleamata on that part, and the other none. With regard to Melophagus, the distinctness in its general appearance is far more striking to the casual observer, this, unlike the two former, being defini
tute of wings: in the structure of the antennae it agrees with H. equina, a species admitted by every writer under the name of hippopofeae. We shall consider these new genera as sectional divisions of the hippopofae in the subfequent arrangement.

*Hippolbopa*. Winged; eyes very dilatant; head without fleamata; antennae in the form of a globule tubercle inserted in a hollow at the base of the head.

*Equina*. Wings obtuse; thorax variegated; feet armed with four claws. Linn. Horse spider fly, Donov. Br. Inf.

Inhabits Europe, and infests cattle, hiding themselves under the hairs, and attaching themselves firmly to the skin by means of the double pair of crotchets or hooks of their feet: it is of a disfiguring form, flat, and hard, and, like the two succeeding species, not easily killed by pressure. The head is brown; thorax brown, varieed with yellowish, and a band of the same down the middle: wings hyaline, with a brown spot near the outer margin: legs annulated with yellow and brown. Length about three quarters of an inch.

*Ornithomyia*. Winged; eyes very dilatant; head furnished with fleamata; antennae lamelliform and advanced.

Insects birds as the former infests quadrupeds, secreting itself among the feathers, and subsisting on their blood. The body is dull brown, with a greenish call; fize inferior to the former; length about half an inch.

*Hippodinium*. Wings tapering to a point, feet with five claws. Linn. Donov. Br. Inf.

Body brown tinged with blueish; abdomen darker. Like the preceding, infests birds, but more generally the swallow, and is often found in the nett of the common European kind.

*Melophagus*. No wings; eyes less dilatant; antennae in the form of a tubercle, lodged in a hollow: valves of the fucker longer than the head.

*HIPPOCASTANUM*, in Ichthyology, a species of Synagnathus; which see.

*HIPPOCAMPUS*, in Botany, from Pericarp, a horfe, and xeris, xeris, a chefnut, the Horfe Chefnut. Chefnus, in his Hiil Plante, v. 1. 8, says the name is a translation of the Turkish H.
The Turkish appellation of this tree, at ceftans, or ad ceftans, given to it because the fruit was found good for the cough or broken wind in horses. (See Esculius.) Some have supposed this fine tree, so ornamental to our English plantations, parks, and avenues, a native of America; but it appears from the works of Clusius to have been brought from the Constanitpol to Vienna, and was found wild by Mr. Hawkins, the companion of the late Dr. Sibthorp, on mount Pindus, of whose celebrated travels it makes a principal part.

The greatest wonder is, that no name or description, applicable to so singular and beautiful a tree, should be discoverable among the writings of the ancients, and that the epithet pinifr should have been given to this famous mountain, but more expressive of what must constitute its great and peculiar beauty, the rich foliage and magnificent branches of the horse-chestnut. See Clusius.

Hippocentaur, formed of πηνος, horse, κενταυρος, centaur, πονγος, I pur, and ταυρους, bull, in Antiquity, a fabulous monster, supposed to be half horse and half man.

What gave occasion to this fable was, that the people of Thessaly, inhabiting near mount Pelion, became thus denominated, because they were the first who taught the art of mounting on horseback; which occasioned some of their neighbours to imagine, that the horse and man made but one animal.

The hippocentaurs should seem to have differed from the centaurs, in this, that the latter only rode on bullocks, and the former on horses, as the names themselves intimate. (See Centaurs.) Under that article it has been shown that the appellation was derived from the practice of breaking or mounting horses, for which the Thessalians were the most famous. These horsemen afterwards, in order to acquire greater strength and agility, performed a kind of exercise, in which they fought with bulls, which they pierced with their javelins, or overthrew by grappling them by the horns. Pliny informs us not only that this exercise was common among the Thessalians, who invented it, but also that it was one of the novelties which Julius Cæsar exhibited to the Romans. It is very probable, therefore, that in speaking of these Thessalians, they added to the name of Hippo the word of Centaur, and hence of these three words, πηνος, horse, κενταυρος, centaur, πονγος, I pur, was compounded that of hippocentaur, a horsem-an-bull-shooter.

As these horsemen became formidable afterwards by their depredations, the equivocation which appeared in the name made them to be accounted monsters compounded of two natures. The poets availed themselves of this idea; and as in other instances they gave the air of marvellous to the subjects of which they treated, they made no difficulty in taking horsemen for Centaurs. And these horsemen became giants both in hereditary and fable.

On the medals of Gallienus is represented a centaur drawing a bow, or holding a globe in the right hand, and the helm of a ship in the left; with this inscription, Apollini case, Ave. To Apollo the conqueror of Augustus. Tritian considers both the one and the other as a symbol of the protection Gallienus received from Apollo in his wars against the Persians.

Hippoccephaloides, the horse-head stone.

The word is derived from the Greek επος, horse, and κενταυρός, the head; and is a name given by Dr. Plot to a stone found in Oxfordshire, and in other places, and supposed to resemble the head of a horse in figure, though the truth is, it requires a very warm imagination to make out the resemblance.

The stone is composed of the matter of the common red or brown clay stone, and owes its figure to a shell of the cockle kind, into which having been received at a time when it was soft and moist, it has taken the exact figure and lineaments of its inner parts. It is about the size of the larger buckwheat, from an inch and a half to two inches and a half in length, and indeed very much resembles that stone, having been formed wholly in the same manner, and in a shell of the same genus. Hill's Hist. of Fossils, p. 68.

Hippocrates, Vinum Hippocraticum, a kind of medicated wine.

Menage approves the conjecture of those who derive hippocras from Hippocrates, as supposing him the inventor of it, but we may better deduce it from the manica Hippocratis, or Hippocrates's sleeve, used in the filtration of it. Hippocrates is a drink composed of wine, with spices and other ingredients infused in it; much used among the French by way of a cordial dram after meals.

There are various kinds of hippocras, according to the kind of wine, and the other additional ingredients made use of; as white hippocras, red hippocras, claret hippocras, strawberry hippocras, hippocras without wine, cider hippocras, &c.

That directed in our late college dispensary, is to be made of cloves, ginger, cinnamon, and nutmegs, beat, infused in canary, with sugar; to the infusion, milk, a lemon, and some slips of rosemary, are to be put, and the whole strained through a flannel. It is recommended as a cordial, and is good in paralytic, and all nervous cafes.

Hippocrates, in Botany, is so named in commemoration of Hippocrates, the most celebrated of ancient physicians, and universally termed the "father of physic."—This genus was called Coa by Plumer, from the circumstance of Hippocrates having been born in the island of Cos, and therefore usually known by the name of Hippocrates Coas.—Linnaeus. Sp. Pl. v. 1. 193. Vahl. Enum. v. 2. 26. Mart. Mill. Diet. v. 2. Juss. 251. Lamarck. Illust. t. 28. (Coa; Plum. 6. t. 37. B Jecco; Linn. f. 314.) Clus. and order, Triandria Alonogynia. Nat. Ord. Tribulata, Linn. Aetra, Juss.

Gen. Ch. Cal. Perianth of one leaf, spreading, minute, coloured, deciduous, deeply divided into five, roundish, spreading, obtuse segments, larger than the corolla. Cor. Petals five, ovate, somewhat excavated at the tip. Stam. Filaments three, awl-shaped, erect, as long as the corolla; anthers broad, with a transverse furrow. Pfi. German oval; style as long as the stamens; stigma obsolete. Peric. Capsules three, elliptical, compressed, large, with two-valved cells; valves keeled and compressed. Seeds five in each capsule, oblong, with a membranaceous wing.

Professor Vahl has described eight species of this genus in his Enumeratio Plantorum, though Linnaeus was only acquainted with Hippocrates poladilla, but as this is a genus very little known, and curious for being triandrous in a natural order that has usually eight or ten stamens, we are induced to give an abstract of all the species found in the former author, following the professor's arrangement.

1. H. coerulea. Vahl. Enum. n. 1. (H. scecei; Jacq. Amer. 9 t. 9.)—Leaves ovato-lanceolate, serrate. Capsules orbicular. Native of South America. It flowers in April and December, the bare fruit in July. Branches purplish. Leaves from one to three inches long, and little more than an inch broad, rounded at the base, a little pointed, entire in the lower part. Stipula solitary, minute.

2. \textit{H. ovata}. Vahl. \textit{n. 2}. (H. vulubis; Linn. Syll. V. 83).—"Leaves oblong or ovate, lanceolate or elliptic, ferrigated. \textit{Capsules oval}.

—\textit{A native of South America}.—Leaves two or three inches long, obtuse at each end, smooth above; their \textit{flanks} purplish, channelled above. Branches of the panicle divaricated, and, like the flowers, slightly ferrigated and downy. \textit{Capsules} about two inches long, scarcely an inch broad, very obtuse, feldom emarginate.

—\textit{Native of Cayenne}.—\textit{Branches} slightly ferrigated and downy. Leaves three inches long, rather obtuse, shining, of a reddish-brown underneath, gracefully veined; \textit{flanks} purplish, smooth. The partial \textit{flower-flanks} two, at the divisions of the panicle. Inoffensiveness very similar to that of the last species.

—\textit{Found in groves upon the Andes}.—\textit{Whole plant smooth. \textit{Branches} forked. \textit{Leaves} spreading, sometimes oblong, from a thatched, smooth above; \textit{flanks} twirled, short. \textit{Bract} ovate, acute, hollow. \textit{Flowers} yellow. \textit{Stamens} united into a sort of cup, which includes the germen; anthers gaping at the top. \textit{Germen} obovate, triangular. \textit{Style} three-furrowed at the top; \textit{lip} triangular. \textit{Capsules} an inch long.

—\textit{Native of the East Indies}.—\textit{Whole plant smooth. \textit{Branches} round. \textit{Leaves} two inches long, slightly ferrigated towards the end, acute, sometimes rather obtuse, membranaceous, pale green, a little nervele on the upper side. \textit{Panicles} shorter than the leaves. \textit{Flowers} smooth. \textit{Capsules} an inch long, ferrigated, gaping in the middle.

A variety, \textit{a}, of this species, called by Vahl \textit{Euonymoides}, is described by that author with oblong or obovate leaves, entire or emarginate at the top. This variety differs in having the branches more remote, and its leaves three or four times as small as in the original; there are also fewer flowers in the panicles.

6. \textit{H. paniculata}. Vahl. \textit{n. 6}.—"\textit{Leaves} oblong, acute at each end, obtusely ferrigated.

—\textit{Found at Sierra Leone, and described by Vahl from a specimen in the Herbarium of Juffieu}.—\textit{Branches} shining, much spreading, extended at the joints, compreended at the top. \textit{Leaves} three or four inches long, membranaceous, pale green. \textit{Flower-flanks} half as long as the leaves. \textit{Its fruit} is not known.

—This, like the last, is a native of Africa, and preferred in the collection of Juffieu.

—\textit{Leaves} five or six inches long, a little acuminate, membranaceous, pale green, shining above. The \textit{fruit} has not been seen.

—\textit{Native of woods in the interior of Honduras, flowering in February and perfecting fruit in the middle of Summer. The natives of St. Domingo call it \textit{Amancier des Bois}. Stem climbing to a considerable height. \textit{Branches} divaricated, reflexed, pendulous. \textit{Leaves} opposite, entire, shining on both sides, having flower-flanks, round foot-flanks. \textit{Panicles} terminal, repeatedly subdivided, bearing numerous, single-flowered, white peduncles. \textit{Flowers} polygnamous, most of them barren. Petals oblong, obtuse, white, persistent. \textit{Filaments} inserted into the interior margin of the nectar. \textit{Capsules} slightly ferrigated, of two valves, gaping in the middle. \textit{Nuts} four, oblong, angulated, at first soft, but growing harder as they ripen, winged at the side and top; kernels sweetish and oily.

The general habit of this genus is climbing, with very spreading branches, round and smooth in the lower part, and somewhat square at the upper. \textit{Leaves} opposite, on foot-flanks, smooth on both sides. \textit{Panicles} axillary and terminal, opposite, dichotomous. \textit{Flowers} small. \textit{Capsules} smooth.

\textbf{Hippocrates}, in \textit{Biography}, the most distinguished of the ancient physicians, and usually called the \textit{father of phy-sics}, was born in the island of Cos, in the first year of the 8th Olympiad, or about 646 years before Christ. He was of the family of the Aclepiades, \textit{i.e.} the descendants of \textit{Aeculapius}; his father, Heraclides, being the seventeenth lineal descendant from that perfogage, and the sixteenth from Podarixs, who, with his brother, Machacon, followed the army of the Greeks, in the Trojan war, according to Homer. In this family the profession of phyics had been hereditarily followed from \textit{Efeclerus} downwards, and under their direction the Coan school attained its highest degree of eminence. His maternal ancestry was also honourable; his mother, Phenarete, being renumerated the 18th lineal descendant from \textit{Hermes}. Born under these favourable circumstances, surrounded from his infancy with all the objects of his studies, and aided by the collective knowledge, as well as invited to research by the fame of his ancestors, \textit{Hippocrates} devoted himself zealously to the cultivation of the art, which he was destined to refine and improve. Not content with adopting the empirical practice which was hereditary in his family, he studied medicine under \textit{Herodacus}, who had invented the gymnastic medicine, and was instructed in philosophy and eloquence by \textit{Gorgias}, a celebrated sophist, and brother of the physician just mentioned. He is said also to have been a pupil of \textit{Democritus} (\textit{Cellus}, lib. i. pref.) which, however, is considered as improbable; and to have been a follower of the doctrines of \textit{Heraclitus}. In whatever study he engaged, however, he appears to have been a true eclectic, to have thought for himself, and to have adopted only those principles which appeared to be founded in sound reason. Thus, while he elucidated the empirical doctrines handed down to him by the light of philosophy, he corrected, or rather rejected, the false theories with which the philosophers, who had no practical knowledge of diseases, had loaded the science of medicine, and brought it into the true path of observation, under the direction of reason, that is, of a rational experience. Hence he is said to have been the first who separated the science of medicine from philosophy, or rather from mere speculation, which then assumed that name. (\textit{Hippocrates} \textit{Cous primus quidem, ex omnibus memorie dignus, ab studio sapientiae disciplinam hanc (feil. medicinam) separavit, vir et arte et facundia insignis.} \textit{Cellus}, loco citato.)

For he confided philosophy and medicine as mutual aids to each other, and the proper union of the two as conferring a god-like qualification on man: \textit{καὶ λεγόμενον \'ομολογωμενον ἡ ἡμας ἡμῖν.} (\textit{Lib. De decenii ornatu.}) Hence the physicians of the rational or dogmatic sect (to called in opposition to the empirical sect) always acknowledged \textit{Hippocrates} as their leader, being the first who combined reasoning with experience.

Of the events of his life little is known with certainty: for of those that are recorded, some have a fabulous appearance, and some are actually inconsistent with our knowledge of history. It is certain, that, after the manner of those times, he spent the greater part of his life in travelling; re-
HIPPOCRATES.

fiding, however, for a considerable period, at various places, in which he was occupied in the practice of his art. In this way he visited the greater part of Greece and Asia Minor; but it appears from his writings that his chief abode was in the provinces of Thebaid and Thrace, especially at Larissa, the chief city of the former, where he composed several books. Almost all the cases of disease, which are well described in his books on epidemic disorders, occurred during his practice in these provinces. According to Soranus, he spent some time at the court of Macedon, where he signaled himself, in consultation with Euerphon, a senior physician, by detecting the origin of the malady of the young Perdiccas. His observation of the emotion of the prince on the appearance of Phila, a mistress of his father, led him to pronounce that love alone was capable of curing the disease which it had occasioned. His fame caused him to receive invitations from different cities of Greece. He is said to have been requested by the inhabitants of Abdera to go and cure their celebrated fellow-citizen, Democritus, of the madness under which they supposed him to labour. The alleged letter of the Abderites on this occasion is still preserved. On visiting the philosopher, Hippocrates pronounced him not mad; but, on the contrary, the witful man in their city. A speech ascribed to his son Theophilus is also extant, in which the services of Hippocrates to the Athenians are enumerated. It is here said, that Illyria and Paeonia being ravaged by the plague, the inhabitants of those countries offered large sums of money to induce Hippocrates to come to their relief; but that certain winds which at that time prevailed, led him to foretell that the pestilence was likely to penetrate into Greece; he, therefore, refused to quit his own country, but sent his two sons, and his son-in-law, through the different provinces, to convey the proper instructions for avoiding the infection; he himself went to Thessaly, and returned to Athens, where he conferred such eminent services on the citizens, that they hailed a decree honouring him with a crown of gold, and initiating him and his family in the sacred mysteries of Ceres and Proserpine. Hippocrates is likewise reported to have refused an invitation from Artaxerxes, king of Persia, accompanied by a promise of every reward and honour which he might desire, to repair to his dominions during a season of pestilence. The letters alleged to have passed on this occasion are extant, in one of which Hippocrates replies, that "he has food, clothing, and a habitation, in his own country; that it would be unworthy of him to aspire to the wealth and grandeur of the Persians, or to cure barbarians who were the enemies of Greece." The enraged king ordered the inhabitants of Cos to deliver up Hippocrates, or to expect the terrors of his vengeance; but the islanders declared their resolution to defend the life and liberty of their valued countryman at all hazards, and nothing was attempted by the Persian. Most of these stories, however, are deemed fictitious by the most intelligent critics. The cure of the young Perdiccas probably originated from the report of a similar cure ascribed to Eneasstratus (which fee); and the interview with Democritus is not supported by any satisfactory evidence. The relation of the services of Hippocrates, during the plague at Athens, is altogether irreconcilable with the accounts of Galen and of Theophrastus; the latter of whom is silent as to the name of Hippocrates, and affirms that the disease was unchecked, and that the physicians were its first victims. Besides, that plague commenced during the Peloponnesian war, in the 23rd year of the 57th Olympiad, at which time Hippocrates was about thirty years old, and therefore could not have had two sons or a son-in-law in a condition to practice. It is supposed by M. Le Clerc, that Aetius ascribed to Hippocrates the operations during the plague at Athens, which Plutarch, with more appearance of truth, imputed to Aetius of Agrigentum (see Aetius); and Dr. Fabricius generally concludes, that these facts were all invented after the death of Hippocrates, and ascribed to him by the followers of the two last fects, of which, as we have already observed, he was regarded as the founder. (See Fabric. Biblioth. Graeca, tom. ii. p. 512. edit. Harles.) The letters and other pieces, which are preferred with the works of Hippocrates, under the title of \( \text{τὰ ἴσωρα} \), and on the authority of which these anecdotes are related, are generally deemed spurious.

After a long life spent in the successful practice of his art, in perfecting his rational system of medical inquiry, and in forming disciples worthy to supply his place, Hippocrates died at Larissa in Thessaly, at the age of 85, or 90, or, as others affirm, of 104 or even 109 years. He was buried between that city and Gyrotum. Besides two sons, Theophilus and Draco, both eminent practitioners, he left a daughter, married to his favourite pupil, Polybus, who arranged and published the works of his great master; he left also a number of disciples.

How dubious forever many of the circumstances of the life of Hippocrates may be, it is not questioned that he acquired a reputation, which has ranked him high among the great men of Greece, and which may be traced from age to age, from the time in which he flourished through all succeeding periods. He has not only passed, by almost universal consent, for the father of phyic and the prince of physicians, but his opinions were everywhere respected as oracles, not only in the schools of medicine, but in the courts of law. Philosophers of every sect were eager to read, to quote, and to comment upon his writings. He has shared with Plato the title of Divine; and not only statues, but temples were erected to his memory, and his altars were covered with incense, like those of Aesculapius himself. Indeed the qualifications and duties required in the character of the physician, were never more fully exemplified than in his conduct, or more eloquently described than by his pen. He had formed a very exalted notion of the dignity and usefulness of his profession, which is only lowered, he said, in the public estimation, by the ignorance of its professors; and he supported this dignity in his own person by the most rigid attention to the morality of private life, by great simplicity, candour, and benevolence in all his intercourse with the sick, and by unwearied zeal in investigating the nature and progress of diseases, and in administering to their cure. He is said to have admitted no one to his instructions without the solemnity of an oath, the form of which is transmitted to us among his writings. In this the most religious attachment to the advantages of the sick, the strictest chastity, and inviolable secrecy, in regard to whatever it seemed improper to divulge, are the principal points inculcated.

The books attributed to Hippocrates amount to seventy-two in number, of which, however, a considerable part are regarded as spurious; some containing opinions which were not prevalent till long after the age of Hippocrates, and some differing altogether in style and composition from the genuine writings of that master, which are composed in the Ionic dialect, and are distinguished by a remarkable conciseness, and, as it were, compression of language, which at times, indeed, borders upon obscurity. Some pieces have been obviously written after the commencement of the Christian era, and Galen affirms that several interpolated alterations were made by Dioscorides and Artemidorus, furnamed Capito, in the time of Adrian. Polybus, the son-in-law of Hippocrates, who collected and edited his works, is believed to have written some of the pieces, and Theophilus and Draco,
his sons, as well as Hippocrates III. and IV., his grandsons, are supposing to have written others, especially several of the books of "Epidemics." Again, Hippocrates, the first of the name, and grandfather of the great Hippocrates, is the reputed author of the treatises Πεπλον ἐθνος and Πεπλον ἐθνος, as well as of that Πεπλον ἐθνος: while some eager have been ascribed to the physicians of the contemporary Chianid school. The following works are generally deemed original productions of Hippocrates, the Conn: namely, 1. The eliy "On Air, Waters, and Soils"; 2. The first and third books of "Epidemics"; 3. The book "On Prognostics"; 4. The first and second books of "Predictions," and 5. The books of "Aphorisms": but the two last contain many interpolations by the two writers above mentioned, and others; 6. The treatise "On the Diet in Acute Diseases." 7. "On Wounds of the Head." Haller includes several more treatises in the list of genuine works of Hippocrates, which, however, have been disputed, even from ancient times; such as those "On the Nature of Man;" "On the Humours;" "On Fractures;" "On the Joints;" and one or two others. Upon this subject the reader will find ample information in the able and learned essay of Dr. Acébius, on the life and writings of Hippocrates, printed in Fabricius's Bibliotheca Graeca, (4th edit. by Harles) tom. ii. —also in Haller's Biblioth. Anat. Med. et Chirurg. Gallic. Hiif. Med. Per. pta. Le Clerc. Hist. de la Médecine, p. 1. liv. iii. chap. 30.

The prodigious degree of authority, so long attached to the writings of Hippocrates, has occasioned such a multitude of editions, versions, commentaries, dissertations, &c. as that many pages would be required to enumerate them. Haller has bestowed much labour upon this object, and may be consulted by the curious. We must confine ourselves here to a curiosy notice of the principal editions of the whole works.

The Greek editions are those of Aldus, at Venice, in 1526, folio; and of Frobenius at Basle, in 1538, folio.

The Latin editions are those of Cratander, at Basle, in 1526, folio, translated by several hands;—of M.F. Colinus, at Renne, 1525 and 1549, translated from MSS. in the Vatican, by order of pope Clement VII.;—of J. Cornarius, at Venice, in 1545, 8vo., whose version has been frequently reprinted; and the version of Anutius Fochius, at Frankfort, 1596, 8vo. by Wechel.

The Greek and Latin editions are those of Hieronymus Mercurialis, at Venice, 1578, folio;—of Zwingier, with the version of Cornarius, at Basle, 1579, folio;—of Anutius Fochius, at Frantfort, 1595, several times reprinted;—of J. A. Vander Linden, also with the Latin version of Cornarius, at Leyden, 1665, 2 vols. 8vo. reprinted at Venice, 1757, in 2 vols. 4to. —of Renatus Chastrier, together with the works of Gelen, at Paris, in 14 vols. folio;—and of Steph. Mack, at Vienna, 1743, 1749, and 1759, 2 vols. folio.

Doctrines of Hippocrates.—To give a minute detail of the extent of the knowledge of Hippocrates in medicine, and in the collateral branches of anatomy, physiology, &c. as it may be collected from his various treatises, would be to write a volume on the subject. We must, therefore, limit ourselves to an outline of his general precepts, referring those of our readers, who may wish for a more ample view of them, to the works above-mentioned as genuine, or to the writers quoted in the course of this article. The anatomical knowledge of Hippocrates was necessarily limited by the prejudices of the times in which he lived, when the human body had never been dissected for the purposes of anatomical enquiry; Eriphylus and Herophilus, as we have stated, were the first to whom this permission was given. His knowledge of the internal organs could only, therefore, be derived from accident, or a comparison with those of other animals. Hence, much of his physiological doctrines, and of his opinions respecting the causes and effects of disease, must necessarily be erroneous, and the whole extremely defective; especially, when to ignorance of anatomy, the general deficiency of the age, in regard to the properties of the external world, is added. But by unceasing observation of the phenomena of health and disease, Hippocrates in a great measure supplied the want of such knowledge; so that his pathology and principles of cure, in many instances, a surprising resemblance to those of our own times, notwithstanding our knowledge of the intimate structure of the human body, and the general improvements in the philosophy of nature.

Hippocrates considered the functions of the body as under the direction of an intelligent or instinctive principle, which he called nature. To this principle he ascribed the "distribution of the blood, the spirits, and heat, to the different parts of the body, which receive by thence men's life and feeling." (Lib. de Alimento.) He said, "nourishes, preserves, and causes the growth of all the parts." Its mode of operation he conceived to consist in attracting, preparing, or changing whatever was useless, and in rejecting whatever was injurious or superfluous, after having separated it from the useful; and this he supposed to be effected by a sort of affinity and repulsion in similar and dissimilar parts. This doctrine, under various modifications, has passed through all medical systems, differing in many inferences only in the change of names; thus, in the "Nature" of Hippocrates, we find the "Archeus," the "vital principle," the "spirit of animation," the "vis medicae nature," of the most enlightened medical philosophers of later times. It is not easy to collect an accurate view of the anatomy of Hippocrates, since different statements on many points are to be found in different parts of the works ascribed to him; it is to be regretted, that the book written by Galen, "De Anatomia Hippocratin," is lost. With respect to the brain, it does not appear that Hippocrates had the least suspicion of its connection with sensibility and understanding; indeed, so far from considering it as the peculiar seat of the thinking faculty, he places this faculty in the left ventricle of the heart. (Lib. De Corde.) He considered the brain as a glandular body, from its texture, and as a receptacle of redundant moisture, collected by the condensation of hot vapours, which it discharges again in distillations and catarrhs. (Lib. De Glandulis.) In describing the optic nerve, he represents it as a mere tube, through which the aqueous humour is distilled into the eye. But it should be observed, that the book De Glandulis is deemed spurious by Galen; and that, De Corde, in which the structure of the heart is rather minutely described, is neither mentioned by Erotian nor by Galen. The heart seems to have been regarded, at that time, as the organ for mixing with the blood from the aerial principle, drawn from the lungs by its arteries, which are described as inferiors, or bellows, calculated for that purpose. Indeed, whatever was known to the ancients in regard to the motion of the blood, seems to have been inclined to some vague idea of regurgitation, or a certain flux and reflux, barely sufficient to prevent the stagnation of the contents of the vessels. The lungs were deemed by Hippocrates the absorbers and conduits of superfluous humours, and the moderators of internal heat; the liver, as the source of fangification and of heat, in common with the other abdominal viscera. His physiology of generation indicates his
HIPPOCRATES.

...his imperfect knowledge of the organs concerned in that process; he had an extraordinary notion of the femen being prepared in the brain and made the spinal marrow the vessels provided for its reception. He appears to have had no accurate ideas of muscles or of muscular motion, though he was acquainted with the number, figure, and connection of the bones.

The fluids were divided by Hippocrates into the four humours, blood, phlegm, yellow, and black bile (Lib. De Natura Hominis); to which he ascribes peculiar properties of hot, cold, dry, cold, and moist, in different combinations. He considered health as the result of a due temperament and proportion of these several fluids, both in respect to quantity and quality; and looked for the source of disease in the excess, defect, or deprivation of any or all of these humours. He, likewise, included in his history an analogy or connection between the four humours and the four seasons of the year, as well as the four ages of man. Thus phlegm, which is the coldest humour, he believed to be increased during the winter and in old age; whence at those periods putrid diseases were prevalent, such as excreta, Óedema, &c. In the spring, the blood begins to be redundant, especially in young people, who then suffer bleedings from the nofe, deftery, &c. As the summer and autumn advance, the disposition to bilious diseases augmented, bilious evacuations occur spontaneously, and are procured by medicine. We have seen how this doctrine, of the four humours, and four qualities, when extended to all the agents employed in medicine by Galen, became the prevalent code of physicians for thirteen centuries; nor is it long since the relics of it yielded to the influence of experimental science. See Galenical System.

But it is chiefly in matters of fact and observation that succeeding ages were indebted to the genius of Hippocrates, and in which the influence of his authority is still extensively visible in the language of medical science. He divided the causes of diseases into external, including the influence of air, exercise, rest, sleep, and watching; and internal, comprehending the food, drink, secretions, retentions, and pallions of the mind. He divided diseases themselves into epidemic, endemic, and sporadic, according to the present signification of those terms; and again into acute and chronic, limiting the former to the duration of fourteen days. He, likewise, divided the duration of an acute disease into four stages, the beginning, increase, height, and decline. It was in the third of these stages that he conceived the conception of the morbif humours to be accomplished, and between this and the last stage, when he expected some indication from nature, by what outlet the morbid matter was to be expelled, which constituted the crisis of the disorder, and which he was careful not to interrupt. (See Concoction and Crisis.) These critical discharges and changes he was led to, partly by experience, and partly by hypothesis, to expect on particular days; and many of his rules of prognosis in acute diseases, were built upon the observation of the changes of symptoms on such days. This doctrine, however, we have already discussed at length (see Critical Days); and shall only remark, that the notion of a concoction and critical discharge of peccant matter, as the source of the phenomena of fever and inflammatory diseases, continued, under some modifications, to be the leading feature in medical systems to the time of Hoffmann; that even Dr. Cullen did not altogether reject it; and that it still exists in popular language, and in vulgar medical opinions.

To the industry of Hippocrates we are indebted probably for an account of all diseases which came under his inspection; and of the whole number, the greatest part are still characterized by the names invented or adopted by him, and in more than five or six of them appear to be extinguisng or unknown. Le Clerc has occupied a long chapter in enumerating the diseases which still retain the appellations given them by the father of physic. (See Hif. de la Médecine, p. 1. liv. iii. chap. 8.; also, Gallicic, loc. cit. pp. 577—630.) But a distinguishing feature in the pathological talent of Hippocrates was his skill in diagnosis and prognosis; his singular and confident care in watching all the minute changes in disease, having obtained for him a critical knowledge of symptoms, which enabled him not only to discriminate one disease from another, but to foresee almost all their variations and terminations. On this point, Celsus admits that Hippocrates food unrivalled by any of his successors: "cum nostris quoque medicis, quamvis in cura tibuminum mutatur, tamen hinc illum optimo praegnifi fateatur." (De Medicina, lib. ii. Pref.) He carefully noticed a multitude of signs, which escaped the eye of superficial observers. In a number of little peculiarities of mind and body, in the position of the limbs, (see DEXURITIS), in the voluntary and involuntary motions, and the expressions of countenance, he showed that indications of great importance might be discerned. But his most certain prognosis was founded on the nature of the secretions, and of the urinary and alvine discharges, the various appearances of which supplied him with such rational grounds of judgment, as succeeding investigation has scarcely been able to impeach. His book of "Aphorisms" and "Prognostic," contain the principal summary of his experience in symptomatology. The books of "Predictions," however, and of "Con Prognostics," contain many erroneous precepts, whence Galen doubts their authenticity, and considers all that is valuable in them, as having been compiled from the two former books, and the books of "Epidemics." It has been disputed among writers, whether Hippocrates had any knowledge of the pulse: and although the affirmative seems probable, it is obvious that he did not lay much stress upon it in forming his indications.

With respect to the practice of Hippocrates, the length, to which this article has already extended, compels us to be brief. It would appear, indeed, that he considered it to be the duty of a physician, rather to watch patiently the progress of the operations of the constitution, and to remove impediments and aid the salutary actions, than to excite any decided changes by the action of powerful medicines. His observations on the powers of nature, and on the wisdom of trusting to her efforts, in preference to the hafty, violent, or uncertain assistance of art, are frequently repeated. His general principles of cure are stated in the following axioms: "that as contraries are cured by contraries, so cold is the remedy for heat, and heat for cold; evacuation will cure retention, and repletion will repair the losses inflamed from evacuation: that the art of medicine consists in supplying deficiencies and retracting superfluities, in treating relaxation and contraction by their opposites, and in bringing back to their own channels fluids that are moving in improper courses." (See Lib. de Pratica Medicina, De Natura Humana, De Statura, &c.) Their dependence on the curative, powers of nature led Hippocrates and the ancients in general to commence their therapeutic operations by the regulation of diet alone, in which, indeed, their whole practice often consisted. In contemplating their plans on this subject, modern feelings, and especially those of Englishmen, are appalled at the discipline which they instituted; for in very acute diseases, they interdicted every kind of nutriment for the first three or four days; allowing only as much thin, drink
drink as was sufficient to moisten the parched throat, which
was often administered on a small sponge, to prevent the
thirsty patient from swallowing too copious a draught.
During this period it was intended to leave the active powers
of the constitution at full liberty to drive out or change all
morbid matter. But if this effect did not follow, or if
the strength of the patient failed in the trial, a more plentiful
dilution was then allowed, with a beverage compounded of
parts of water, one of honey, and occasionally one of vine-
gar; sometimes enriched with the juice of acid fruits, cooling
herbs, or some weak sharp wines: pittan, or barley-water,
was also a common beverage given by Hippocrates in acute
diseases. This plan, when necessary, was generally con-
tinued till the fourteenth day, (the reputed commencement
of the chronic term,) when a more substantial diet was allowed,
though still without recourse to any medicine, except gentle
emetics and laxatives, the former constituting generally of a
decoction of hyssop with salt and vinegar, and the latter of
expressed juice or decoction of common cabbage, or the herb
mace, or the more pleasant exhibition of whey a little
fatt. For the last mentioned purpose glysters of fe-
water, or of vetches boiled in milk with a little salt, were in
common use.

When more powerful medicines became necessary, the an-
cients resorted to some of the most active purgatives hitherto
discovered in the vegetable world; such as black and white
hellebore, elatiunum, colochny, and feammony, which were
frequently administered in quick succession: but these were
never preferred to children, old people, or pregnant women.
Notwithstanding the caution, however, with which these
draff medicines were given, it would seem that the most
serious mischief sometimes ensued from their excessive opera-
tion; as Hippocrates mentions, among his aphorisms, that
"convulsions after taking hellebore are fatal." In order to
excite perpiration, he used every external means of increas-
ing heat, such as warming the room, covering the patient,
pouring hot water on the head and limbs, with a free internal
use of heated liquors, and often of pure wine. And to in-
crease the urine, he gave garlic, cucumbers, melons, celery,
fennel, and other strong flavoured herbs.

Hippocrates did not, however, exclusively confine him-
sell to the administration of internal remedies, and the reg-
ulation of diet, he referred to external means of cure, in
some of which he appears to have exceeded the limits of
modern activity, as far as he fell short of them, in merely
watching the effects of the constitution in other cases. He
employed blood-letting (an operation, the origin of which is
concealed by the remoteness of its antiquity) with great fre-
dom. In extreme cases of pain or inflammation, it was his
custom to open at once the veins of both arms, and let the
blood flow till the patient fainted. He often likewise drew
blood copiously from the legs and feet, to relieve complaints
of the head and upper parts of the body, by large and deep
incisions with the knife, which he then covered with copper
or other metallic vessels, exhausted of their air by fire, refem-
bning the cupping glasses of our own times. He seems,
deed, to have entertained many singular notions of the re-
vulsion, which might thus be produced. For example, he
recommends bleeding in the forehead for a head-ache in the
acepit; and in order to restrain the catamenia, when ex-
cevile, he applied large cupping vessels to the mammae.
(Aph. fect. v. 60. and 68.) He laid down a maxim, which
forms a contrast with the inerteries of some of his precepts, that
"those diseases, which medicines will not cure, yield to
the knife; and those which the knife will not cure, may be
removed by fire; but where this last and most powerful re-
medy fails, the malady must be deemed incurable." (Aph.
5 viii. 6.) Accordingly in obstinate chronic cases, the local
bleeding above-mentioned were commonly succeeded by the
actual canterly, which produced large and long continued dis-
charges from the head, neck, breast, side, limbs, or other
parts, to which the burning was freely applied. Nor did he
even spare the bones, which he burnt, sawed, and perforated
without scruple; and he used the trepan itself in cafes of
violent head-ache. It appears, as well from these operations,
as from his rational directions for the treatment of fractures
and dislocations, and the frequent cautions that he gives re-
excluding the danger and difficulty attending wounds and
bruses in nervous or tendinous parts, that Hippocrates com-
bined the practice of surgery with that of medicine. But it
would seem that he thought the difficult operations of surgery
should be performed only by those, who, by confusing their
professional employment with this exercise alone, had attainted
a peculiar dexterity of hand; for he enjoins his disciples,
even in their inaugural oath, to forbear from performing the
operation of lithotomy.

These operations, as well as the number of medicines
mentioned by Hippocrates, imply a considerable previous
advancement both in internal and manual medicine. Le
Clerc has enumerated upwards of three hundred articles of
diet and the materia medica, which were employed by him,
from the animal, vegetable, and mineral kingdoms. Among
these are various preparations of iron, copper, lead, and
silver, alum, nitre, vitriol, &c. Narcotics are mentioned by
Hippocrates, and were certainly used in ancient times; but
he seems to have been cautious in administering them, and it
is even a matter of dispute whether he ever employed opium,
the most potent and useful of the whole class. Among the
articles of diet, Hippocrates is careful to mention the pro-
erties of the flesh of the dog, fox, horse, and as, which
implies that these viands were then in use, at least among the
people.

We shall conclude this account of Hippocrates, with the
brief and philosophical view of the science of medicine, ex-
hibited in his first Aphorism, which in the tenor of its
expression cannot be imitated in a modern language. It
contrasts the brevity of human life with the long experience
necessary to the cultivation of the art of medicine; and
reminds us of the difficulty of obtaining that solid experience
in an art where opportunity is transient, where experiment
itself is often hazardous and deceptive, and the inferences of
the judgment, therefore, extremely difficult. "Vita
brevis, ars longa, occasio celeris, experimentum lubri-
cum, judicium difficile." See Le Clerc, Gacliicke, and Fabriezis,
as above quoted; also the works of Hippocrates, Vita
Hipp. a Sorano, Walker's Memoirs of Medicine. Gene-
ral Biog.

HIPPOCRATES'S Sleeves, manicas Hippocratia, a kind of fille,
or draining-bag, formed by joining the opposite angles of
a square piece of flannel, in form of a pyramid, and used
for percuting or drain syrups, decoctions, &c. for clarifi-
cation.

HIPPOCRATIA, in Antiquity, feasts celebrated by the
Arcadians in honour of the equestrian Neptune, from a
notion that the deity conferred horses on men. During the cele-
bration of them, horses were exempted from all labour,
and were led in procession through the streets, superbly
harnessed, and adorned with garlands of flowers. The
Romans celebrated these feasts under the title of Con-
sualla.

HIPPOCRATIC FACES. See Faces Hippocratics.

HIPPOCRENE, derived from ἰππόκρενος, horse, and ἰππόκρη
fountain, q.d. the fountain of the horse Pegafus, was a spring
at the foot of mount Helicon, supposed to spring up upon
Pegafus.
Hippodrom. Hippodromes, compassed of ippes, barre, and (jjuo, courtes, of the verb (jjuo, ear irresistible, in Antiquity, a lily, or course, wherein chariot and horse-races were performed, and horses exercised.

The Olympic hippodrome, or horse-course, was a space of ground of 600 paces long, surrounded with a wall, near the city Elia, and on the banks of the river Alpheus. It was uneven, and in some degree irregular, on account of the situation; in one part was a hill of moderate height, and the circuit was adorned with temples, altars, and other embellishments. (See Stadion.) Paufanias (i. vi.) has given us the following account of this hippodrome, or horse-course: As you pass out of the stadium, by the seat of the Helenodice, into the place appointed for the horse-races, you come to the barrier (A.ter), where the horses and chariots rendezvous before they enter into the course. This barrier, in its figure, resembles the prow of a ship, with the oar or oar beak turned upwards the course. The other end, which joins on to the portico of Agaptus (so called from him who built it), is very broad. At the extremity of the oar or beak, over a bar that runs across the entrance (ea saucem), is placed a figure of a dolphin in brass. (This dolphin is a symbol of Neptune, surnamed Hippian or Equestrian, for his having produced a horse by striking the earth with his trident, according to the fable; without the collection of which circumstance the reader might be surprized to meet with the figure of a dolphin in a horse-course.) On the two sides of the barrier, each of which is above 400 feet in length, are built stands or lodges, as well for the riding-horses as the chariots, which are distributed by lot among the competitors in those races; and before all these lodges is stretched a cable, from one end to the other, to serve the purpose of a barrier. About the middle of the prow is erected an altar, built of unburnt brick, which every Olympiad is plaited over with fresh mortar; and upon the altar stands a brazen eagle, which spreads out its wings to a great length. This eagle, by means of a machine which is put in motion by the president of the horse-races, is made to mount up at once to such a height in the air, as to become visible to all the spectators; and at the same time, the brazen dolphin before-mentioned sinks to the ground. Upon that signal the cables, stretched before the ladders on either side of the portico of Agaptus,
HIP

Agapitus, are first let loose, and the horses there motioned move out and advance till they come over against the ladders of those who drew the second lot, which are then likewise opened. The same order is observed by all the rest, and in this manner they proceed through the bakr or rotfrum; before which they are drawn up in one line, or front, ready to begin the race, and make trial of the skill of the charioteers and fleetness of the horses. (See Chariot.) On that side of the course, which is formed by a terrace raised with earth, and which is the largest of the two sides, near to the passage that leads out of the course across the terrace, stands an altar of a round figure, dedicated to Taraxippus, the terror of the horses, as his name imports. The other side of the course is formed, not by a terrace of earth, but a hill of moderate height, at the end of which is erected a temple, consecrated to Ceres Chameae, whose private institution has the privilege of seeing the Olympic games.

There is a very famous hippodrome at Constantinople, which was begun by Alexander Severus, and finished by Constantine. This circus, called by the Turks atemidas, is 400 paces long, and above 100 paces wide, i.e. geometrical paces of five feet each. Wheelers says it was in length about 55 ordinary paces, and in breadth about 120; or, allowing each pace to be five feet, 2750 feet long and 630 broad. At the entrance of the hippodrome there is a pyramidal obelisk of granite, in one piece, about 50 feet high, terminating in a point, and charged with hieroglyphics erected on a pedestal of eight or ten feet above the ground. The Greek and Latin inscriptions on its base threw that it was erected by Theodosius; the machines that were employed to raise it were represented upon it in baso relievo. See Circus.

The beauty of the hippodrome at Constantinople has been long since defaced by the rude hands of the Turkish conquerors; but under the familiar appellation of atemidad it still serves as a place of exercise for their horses. Whether the Olympic hippodrome was so long or so wide as this of Constantinople, it is not now easy to determine; but it must evidently have been considerably longer than an ordinary stadium, in order to allow for the turning of the chariots and horses round the pillars which served as metas or goals, without running against them, or again one another. The length of the course, or the distance between the two metas or goals, is not easily ascertained. It is probable, however, that the two pillars, viz. that from which the horses started, and that round which they turned, which divided the course into two equal lengths, were two stadia distant from each other; consequently, the whole length of the race, for a chariot drawn by full aged horses, consisting of 12 rounds, amounted to 48 stadia, or six Grecian miles; and that of the chariot drawn by colts consisted of eight rounds or 32 stadia, or four Grecian miles; a Grecian mile, according to Arcbuthnot's computation, being somewhat more than 8.80 paces, whereas an English mile is equal to 1056. Paschasius informs us, that in the Olympic hippodrome, near that pillar called Nyfée, probably that which was erected at the lower end of the course, stood a bronze image of Hippodamus, holding in his hand a sacred fillet or diadem, prepared to bind the head of Pelops for his victory over Oenomaus; and it is probable that the whole space between the pillars was filled with statues or altars, as that in the hippodrome at Constantinople seems to have been. Here, however, floated the tripod, or table, on which were placed the olive-crowns and the branches of palm defined for the victors. Besides the hippodromes at Olympia and Constantinople, there were courses of a similar kind at Carthage, Alexandria in Egypt, and other places.

We have some vestiges in England of the hippodromes, Vol. XVIII.

woody, irregular, acuminate, excavated with little pits and accompanied by appendages, of seven cells and seven valves; kernels solitary, roundish.

1. H. Mancinella. Linn. Sp. Pl. 1431. Jacq. Amer. 250. t. 159. (Ueglan aifotis arbor jubilera lacteefoa vene-

nata pyriloha, Mancinilla Hippianis dicta; Slom. Jam. v. 2. 3. t. 159.)—Leaves ovate, ferreted, with one gland at the

lobe; flalks half as long as the leaves.—Native of fancy, watery places near the coast in various parts of the West Indies.—This is a tall and spreading tree, of handsome ap-

pearance, compared by Jacquin to a Pear-tree. Every part, when wounded, exudes a plentiful, very white, but highly caufic and venomous milk, raising blisters on the skin like a burn, nor can fiercely any part of the plant be touched withifiety. It is reported, that many of the Europeans who first landed at Surinam did suddenly from sleeping

under this tree. Jacquin fays, that some kind of Land-Crabs become poisonous food from eating the fruit, which is by no means wonderful. The wood, however, is valued for being capable of taking a high polish, and being beautifully variegated with several dark colours. The Leaves are fattered, ovate, acute, with shallow ferratures, smooth, velvety, about two inches long, on flalks not quite fo long, which are flender and smooth, crowned when they enter the bafe of the leaf with one, round, deprefled gland. The male Catkins grow at the end of the branches and are of a yellowish-green colour. Female-flowers at the division of the twigs, solitary, round and green. Fruit the fize of a walnut with- out the coat, of a yellowish-green, reembling a crab-apple in fize and form; the coat is very thin, and not large. Sloane fays, that goats are very fond of the fruit, which does not render either their flefh or their milk poffinous.

It is neceffary to obferve, that Hippomane biglandulosa of the Plantas Surinamenset, n. 129, Amer. Acad. v. 8. 263, appears by the Linnaen Herbarium to be a totally different plant from that originally fo called by Linnaeus, as well as from the above described. Its leaves are like those of Magnolia grandiflora, but we have not materials to determine its genus. Linnaeus fays, the fruit is tripeeceous; if fo, it may belong to the genus Sapium of Jacquin. Willd. v. 4. 572, to which the other Linnaean fpecies of Hippomane are now re-

ferred. If they remain fo, the specific character of the Mancinella becomes fuperfuous.

HIPPOMANES, compounded of iverca, a borse, and μαυαί, madness, a fort of poison, famous among the ancients as an ingredient in amorous philiferes, or charms.

Naturalists are not agreed about the nature of the hippo-

manes. Pliny describes it as a blackthorn commonle found on the head of a new-budded co1; which the bee bites off and eats as foam as it is delivered. He adds, that if the be-

e prevented herein by any other's cutting it off before, he will not take it, nor bring up her young.

Virgil, and after him Servius and Commell's, describe it asLive poifive matter trickling from the pudendum of a male, when proud, or longing for the hurs. En. lib. iv. ver. 515.

At the end of Mr. Bayle's Dictionary is a very learned differtation on the hippomanes; and all its virtues, both real and pretended.

HIPPOMYREX, the hurs, the name of a species of ant much larger and nimbler than the common kind. This builds in woods, and makes its nets of threads and threads, and fragments of various parts of trees. The common ant bushes with earth, but the hurs is

HIPPONE, in Mythology, the goddess of horses and chariots.

HIPPONEUS, in Ancient Geography, a town of Aifa, in Caria.—Alfo, a town of Libya.

HIPPONIATES Sixtus, a gulf of the Tyrrhenian sea, on the western coast of the kingdom of Naples.

HIPPONITES, a lake of Africa, on the banks of which was built the town of Hippo-Zurutus.

HIPPONIUM, called also Tida Valentia, Biruma, a town of Italy, upon the western coast of Brutum, at the lower part of a gulf, which opened to the north.

HIPPPECTINITE, in Natural History, or great foallop, is a foal shell, half a foot orer, found in a great rock in Virginia, 40 miles from a sea or river, according to Dr. Grew. Rarities of Gresham College, p. 262.

HIPPOPHÆÆ, in Botany, apparently from iverca, a horse, and ταυρίς, to defery, a name in Dioscorides for what he fays was used by fullers in drefsing cloths, but whose defcription answers to something of the Rhamnus kind. It is however in some points applicable to the shrub for which it is retained by Linnaeus.—Linn. Gen. 517. Schreb. 682. Mart. Mill. Dict. v. 2. Sm. Fl. Brit. 1075. Juff. 75. Lamarck. Illuftr. t. 828. Gerin. t. 44. (Rhamnoides; Tourn. t. 841.)—Clafs and order, Diocia Trilocandra. Nat. Ord. Calycifoide. Lin. Eglary, Jull.

Gen. Ch. Male, Cal. Perianth of one leaf, divided al-

most to the base into two equal, roundish, obtuse, concave, erect lobes, cohering at their summit, but a little gaping below. Cor. None. Stam. Filaments four, very short; anthers oblong, angular, nearly equal to the calyx.

Female, Cal. Perianth of one leaf, ovate-oblong, tubular, slightly cloven at the top, deciduous. Cor. None. Pist. German superior, small, roundish; style simple, very short; stigma thickish, oblong, recurved, reaching twice the length of the calyx. Peric. Berry nearly globose, of one cell. Seed solitary, oblong, shining, with a furrow at each side, invelled with a double membranous coat.

Obf. Mr. Viborg, the Daith naturalist, has discovered some hermaphrodite flowers, occasionally intermixed with the others. Gardiner describes but a single cot to the seed, which he properly calls the lining of its cell, overlooking a
thicker, almost leathery, integument, or arillus, which closely envelops the seed itself, and which is well displayed by Mr. Sowerby in Engl. Bot.

1. H. rhhamnoides. Linn. Sp. Pl. 1452. Engl. Bot. t. 425. Pall. Roff. v. i. t. 68. Pl. Dan. t. 265. (Rhhamnus secundus. Comm. Ger. Fl. 1454.) Sallow-thorn, or Sea Buckthorn. — Leaves lanceolate. — Nature of fusty banks and marshes near the sea, in various parts of Europe, from the south of France to Finland. It is abundant on the Norfolk coast, growing on the cliffs and sand-banks, and flowering about the middle of May, nor is it unfrequently cultivated in shrubbery. The woody bushy flem is fix or eight feet high, thorny. Leaves scattered, about two inches long, lanceolate or almost linear, bluntish, entire, of a fivery white beneath. Both their surfaces, as well as the young bark and halfripe fruit, are clothed with minute umbilicated scales, as in the genus Elaeagnus. Flowers small, green, in the bofoms of the lowernot leaves of each branch, while very young, the two faxes on different shrubs. Berries ripened in autumn, very copiously on the wild plants, never, as far as we have seen, on garden ones. They are the fize of large currants, of a glowing orange-colour, pulpuy, very acid, agreeable enough when preferred with sugar. Linnaeus found the Finlanders ufling them as a sauce to their fish, but he complained of their intolerable acidity. Rouleaux gives a ludicrous account of the singular politeness of a young man, who seeing him eat these berries, as they were walking together, did not presume to take the liberty of telling him they were considered as poisonous.

2. H. canadensis. Linn. Sp. Pl. 1453. — Canada Sea Buckthorn. — Leaves ovate. — Gathered by Kalm in Canada. It differs from the former in its much shorter, broader, ovate or elliptical leaves, very conspicuous for their fivery back, and the rusty scales scattered over them. The flowers are in little, brown, fising, auxillary clusters.

HIPPOPHAE. This was a name given not only to the larger species of the phoe or flb., but to a very different plant, a kind of dodder, more vulgarly called epimeix, from its growing upon the phoe, as the dodder of thyme is called epithymium, from its growing upon that plant. It is possible indeed that it might be called originally hippoaphes, from its riding, as it were, on the phoe. But however this be, there is great reason to suspect that Dioscorides confounds this dodder with the plant itself, and gives its virtues as those of the proper hippoaphes; which, according to Theophratus, and all the other writers of credit in antiquity, is only a larger species of the phoe, a prickly shrub, not a plant, growing on it. See Epirhaphes.

HIPPOPHALMIC MUSCLES, a name given by the ichthyologists to a pair of large muscles found in the head of fih, one placed immediately under the eye; these serve to move the eyes; and, with the two maxillary muscles placed under the jaws, are the principal muscular parts of the head of fish.

HIPPOPODES, or HIPPOPODES, composed of 1779, hopo, and πεδου, foot, in Ancient Geography, an application given to a certain people situated on the banks of the Scythian sea; as being supposod to have horses' feet.

Thehippopodes are mentioned by Dionysius, Geogr. v. s10. Mela, lib. iii. cap. 6. Pliny, iv. cap. 13. and St. Anguline, De Civit. lib. xvi. cap. 8. But the truth is, that they had this application given them on account of their swiftnes, or lightnes of foot.

HIPPOPATOMUS, in Zoology, a genus of Mammalia in the order Eledon; the front teeth in each jaw are four, those in the upper jaw are remote and form a pair each fide; those in the lower are prominent, and the middle ones longed; the tusks are solitary, the lower ones long, curved, and obliquely truncated; feet furnished with hoofs at the margin.

Whether in reality there may exist more than one species of this genus appears uncertain; there is every reason to apprehend the moroe has been sometimes confounded by travellers with the true hippopotamus; and the discordance which we trace in their reports, arising as it must be conceived from this particular cause, may have erroneously given birth to the prevailing supposition of those writers who believe there are two species. The observations of Senexius seem in favour of the existence of more than one kind, yet his conclusions, however just, are not apparently founded on better authority than the discordance of writers, to which we before alluded. Those who apprehend there are two species consider one as an inhabitant of the fresh water, or rather of inland rivers, lakes, and marshes, and the other to be entirely confined to the sea; the latter is probably the moroe.

After the elephant and the rhinoceros, the hippopotamus has been in all ages an object of admiration to mankind; its size is not equal to that of the rhinoceros, and its force but little, if at all, inferior; and thus in magnitude, as well as strength, it yields alone to the decided inferiority of the elephant.

The appearance of the hippopotamus when on the land is altogether uncouth, the body being extremely large, flat, and round, the head enormously large in proportion, and the legs as disproportionately short. Authors vary considerably in describing the size of this animal. The length of a male has been known to be seventeen feet, the height seven feet, and the circumference fifteen; the head three feet and a half, and the gilt nine feet; the mouth in width about two feet. The general colour of the hippopotamus is brownish; the ears small and pointed, and lined very thickly with fine short hairs; the eyes are small in proportion to the size of the creature, and black; the lips are very thick, broad, and befit with a few scattered tufts of short bristles; the nostrils small. The armament of teeth in its mouth is truly formidable, more particularly the tusks or canine teeth of the lower jaw, which are of a curved form, somewhat cylindrical, lightly curved and longitudinally, and obliquely truncated at the end; they are so strong and hard, that they will strike fire with fleel, are sometimes more than two feet in length, and weigh upwards of six pounds each. The teeth in the upper jaw much smaller; those in the upper jaw are of a moderate size; those in the lowerstrong, somewhat conic, sharp pointed, and projecting forwards almost horizontally. The whole surface of the body is covered with short hair, which is more sparingly set on the under parts than the upper. The tail is short, thick, slightly compressed, a little hairy, and marked by several strong circular wrinkles. The feet are large, and each of the four toes or toes furnished with a hoof.

The colour of the hippopotamus, when just emerging from the water, is pale brown, or mouse colour, the lower parts inclining to blueish or slate colour, the belly flesh colour, and the skin appearing through the hair. Sparman speaks of its "slimy appearance when newly come out of the water, which is said to glisten in the moon-light like a fish;" and other writers agree that the blueish tinge of colour that appears on the body, when rising out of the water, is entirely dissipated as the skin becomes dry.

This animal was well known to the ancients. Most commentators conceive it to be the behemoth of Job, who describes its manners, food, and haunts so admirably, as to leave little reason for believing that scriptural writer alluded to any other animal. In the verfe, "Behold now Behemoth..."
HIPPOPOTAMUS.

which I made near thee; he eateth grafs as an ox." It is
represented as an inhabitant of the Nile, in the neighbouring
hood of Uz, the land of Job; and as an animal that habbits
vegetable food; the second, "Lo! now his strength is
in his loins, and his force is in the navel of his belly;"—and
his bones are as strong as pieces of braic, his bones
are like bars of iron," indicates its great strength and the
hardness of his bones. Its residence among the vast reedy
marshes, in rivers overshadowed with this; forests, is implied
in the verse, "He lieth under the shady trees in the covert
of the reeds and fens." And in the fifth verse, "Behold! he
drinketh up a river; he leadeth he can draw up Jordan
into his mouth," refers to the characteristic wideness of his
mouth, which is poetically described as large enough to ex-
haust each a firearm as the Jordan.

By writers of antiquity, the hippopotamus is described as
possessing the most marvellous powers of strength. They
also affirmed that it vomited fire, in allusion, no doubt, to the
prodigious hardiness of its teeth, which give fire with fuel.
Among the ancient Egyptians it was revered as a tutelary
divinity; they paid it sacred honours, and engraved its image
upon their obelisks. But if we may credit Diodorus Siculius,
they would sometimes wage war against this object of their
adoration, attacking it with spears and daggers, and after
inflicting many grievous wounds, leave the poor lacerated
beast to expire through the loss of blood. In like manner
the negroes of Congo, Angola, Elmina, and other adjacent
parts of Africa, at this day regard the hippopotamus as a god,
yet they not only attack and destroy it, but devour its
flesh with great avidity. The hippopotamus occurs among the
little figures in the canals taken from the ancient tombs of
Sibertis, now at Paris, from whence it is concluded this ani-
mal was formerly known in that part of the world; not as
an inhabitant, the rigorous coldness of the climate forbidding
that idea, but as an idol, and being there worshipped as a
divinity as well as in Egypt.

Pline relates that Scaurus, during his shipwreck, exhibited
before the Roman people four crocodiles, and one hippopota-
mus, in a temporary lake prepared for the occasion. Au-
gustus also produced one of the latter on his triumph over
Cleopatra; and after this the figure of the hippopotamus ap-
ppears on various medals of the Roman emperors. For many
times after no authentic history of this animal was obtained.
The first among modern describers who have noticed it with
accuracy was Zorenghi, an Italian architect, who, about the
beginning of the seventeenth century, printed an account of
it at Naples, accompanied by a figure taken from a dried
skin, which figure is again given in the works of Aldrovandus.
Since that period the history of this animal has been more fully
developed, through the zealous attention bestowed on the
subject by travellers, to whom an opportunity has been af-
farded of examining the animal in the living state, and in
its native regions: and to one of whom the curious are more
indebted, for satisfactory information in this particular,
than to the ingenious Dr. Sparmann.

The vast strength of this animal would render it one of the
most formidable of terrestrial quadrupeds, were its disposition
ferocious; on the contrary, it is an animal of very tranquil
dispositions, unfixed under circumstances of great irritation,
and then its power is really to be dreaded. Its bulk is so
great that twelve oxen have been found necessary to draw
one ahaore that was on fire in a river above the Cape.
The largest hippopotamus, among about thirty, killed by colonel
Graff, was eleven feet long; this was a female; the largest
male, which always exceeds the other in size, was eleven
feet eight inches. Dr. Sparmann, however, describes some
larger; and Mr. Bruce speaks of others in lake Tzana, that
were more than twenty feet long. It is affverted by Haffel-
quilt, that the hide alone is a boon for a camel.

These animals inhabit the warmer parts of the globe; and,
as in ancient times, are found in the Nile, where it flows
through the fens of Upper Egypt, below which it is rarely
seen. The latest instance on record of its appearing near
the mouth of that river, was in the year 1660, when two
were killed near Damocia. It abounds most in the rivers
among the woods and deferts of Africa, and to those of
Asia, as the Gambia, Senegal, Zaire, refining equally the
rivers near their fall into the sea, and in the inland lakes
from the very interior of Africa to the Cape of Good Hope.
Formerly they abounded in rivers near the Cape, but are now
almost extinguished; and it was even found necessary under
the Dutch government, in order to preserve the few remain-
ing in the Berg river, to prohibit shooting them without
express permission.

From the unwieldiness of the body and the shortness of
the legs, the hippopotamus is not able to move very swiftly
upon the land, and he then becomes timid. His pace is,
however, quicker on the land than generally imagined. When
pursued he takes to the water, plunges in, sinks to the bot-
tom, and is seen walking at perfect ease, or swimming with
like facility, the great size of his belly rendering his specific
gavity equal to that of water. He cannot, however, con-
tinue long under water without rising towards the surface to
breathe; and in the day-time he is so fearful of being dis-
covered, that when he takes in a fresh supply of air, the
place is hardly perceptible, for he does not venture even to
put his nose out of the water. In rivers unfrequented by
mankind he is less cautious, and puts his whole head out of
the water. If wounded, he will rise and attack boats or
canoes with great fury, and often sink them by lurching,
or biting large pieces out of their sides, and these people
are frequently drowned by these animals. It is reported also
that they will at once bite a man in two. In shallow rivers
the hippopotamus makes deep holes in the bottom, in order
to conceal its great bulk. When he quits the water he usu-
ally puts out half his body at once, and swims and looks
around, but sometimes rushes out with great impetuosity,
and tramples down every thing in his way. It is hazardous
to navigate canoes in rivers much infested by these animals,
as the slightest movement of their bodies may easily over-
set them.

The food of the hippopotamus is entirely of the vegetable
kind, in quest of which he quits his watery residence, under
the favourable darkens of the night, and ranges in securi-
ity along the banks and adjacent places, destroying in its pro-
gress, by the tramplings of its feet, an infinitely greater
portion of herbage than could possibly be required to sati-
ety the craving of its appetite. He feeds on the roots of grafs
which he readily tears up with his teeth. In cultivated
places he commits in credible mischief, especially among the
plantations of sugar, rice, corn, and other grain, and among
young and tender trees, the shoots of which he eagerly de-
vours.

The manners of the hippopotami approach nearer to those
of the hog than the horde tribe, with which its name implies
an affinity; for which reason Alpin calls them Ceropotamos,
or river-hogs. They commonly sleep in the reedy islands,
in the middle of rivers, and if possible in situations surrounded
by thick fuets, and deep impenetrable marshes; and in such
situations they bring forth their young. A herd of females
is said to have but one male; they bring forth one young
at a time, and that on the land, but suckle the young in the
water. The males often contest each other's right over the
females;
females; and the attack of two such powerful animals, as may naturally be imagined, is terrible. The earth shakes beneath them, the water trembles, their blood flows in torrents, and the maffles of fish torn out by their mighty grasp of teeth lie scattered upon the blood-stained scene of conflict. Sometimes the weaker, perceiving his efforts ineffectual, leaves his antagonist matter of the field, but this does not happen often; for it is seldom that one of both of them does not perish on the spot. The female is supposed to go with young nine months. She is often seen in the rivers with the young one on her back, and her manner of suckling is not dissimilar to that of the cow, the tests, which are small, and in number, being placed far back under the belly; the milk is thin and more aqueous than that of the cow. The female, at particular feasons, has a strong smell of musk.

The modes of capture adopted in taking these animals are various. They are sometimes shot, sometimes attacked with harpoons, and sometimes taken in pit-falls prepared for the occasion in the banks of rivers. In some parts the natives place boards full of sharp iron spikes in the ground, where these heavy beads striking into their feet become incapable of moving, and thus fall an easy prey. Sometimes they are struck in the water with harpoons fixed to cords, and ten or a dozen canoes are employed in the chase. This is the common method in which it is taken in Africa. Hanffquin tells us the Egyptians have a curious manner of relieving themselves in some degree from this destructive animal. "They remark the places (he says) where he frequently molests, and lay a large quantity of peas; when the beast comes ashore, hungry and voracious, he falls to eating what is nearest him; and, filling his belly with the peas, they occasion an unprofitable thirst. He then returns immediately into the river, and drinks upon these dry peas large draughts of water, which suddenly caufe his death; for the peas soon begin to swell with the water, and not long after the Egyptians find him dead on the shore, blown up as if killed by the strongest poison."

The flesh of the hippopotamus is eaten in Africa by the poorer orders of people, who, as a matter of emolument, first separate it from the fat, a kind of fine lard with which the animal abounds, and which bears a considerable price, both on account of its flavour, and because it is supposed to possess many admirable virtues. This animal is also taken for the sake of the hide, which on the back is two inches thick or more, and which, when dried, is said to be proof against the stroke of a musket-ball. This is converted by the Africans into shields or bucklers. The value of the teeth is another inducement for its destruction; the ivory, the tusks in particular, being superior in hardness to ivory, at the same time they are not so subject to become yellow, and therefore better for the purpose of the dentists: superstition has further stamped on them an additional value, the Africans considering them as an antidote to poison, and universally wearing some trinkets formed of these teeth about their persons. And finally it may be added, upon the credit of Labat, that the blood of this animal is employed by the Indian painters in the preparation of their colours, though in what manner we are not informed.

The mild disposition of these animals is confirmed by Belon, who affers us that: when young they are easily tamed. He saw one kept in a stable, and which showed no inclination to escape, or do any kind of mischief, when, as sometimes happened, he was released from his confinement. The cry of this animal has been variously described; Adamson, an author of veracity, declares it to be similar to that of the horne, uttered with considerable force.

In conclusion, we shall notice the interesting observations made on the hippopotamus by Dr. Sparrman, a writer whose accuracy is in general indisputable: the style adopted by that author is rather prolix, and it besides abounds in local incidents not immediately necessary to be related, but as they can be dispensed with without detriment to the fidelity, and tendency of the representation he has given, it will be best to repeat the observations of that traveller in their varied details, in his own words.

"Towards evening, on the 24th of January 1776, we came to a pit in the river, which our guides knew to be frequented by sea-cows (meaning the hippopotamus). For this reason, all unprofitable ways by which these animals might come up from the river were beset by us separately; our hunting party consisting in the whole of seven persons, namely, five of us Christians, together with my Hottentot, and another belonging to the farmers. Besides this, the rest of the Hottentots were ordered to go to the windward, and to the more open places; and by snatching their whips, and making other noises, to frighten and drive the animal towards us, so as to make its appearance; in consequence of which measure, it appeared to us, that when at length it had to go on shore in quest of its food, it must necessarily come to the hiding-place of some one of the hunters. Every one of these places were just at the edge of the river between the reeds which grew on the dry parts of the river, or in those spots which the water had left, and at the same time close to the very narrow paths which the animal had made for itself at each place; in consequence of which disposition, it would inevitably pass not above fix inches, or a foot at most, from the mouth of the sportman's piece. Consequently our whole dependence was upon two circumstances, viz., that our guns should not mis fire, and that the shot should not fail to prove mortal. In the former case, the sportman must have inevitably paid for his temerity with his life; though in the latter, he had reason to hope, from instances of what had happened to others, that the fire, together with the report from the piece, as well as the ball itself, would confound the animal, so as to prevent it from immediately making towards its enemy. The banks of the pit, which were then beset, were in most places steep and perpendicular, and the pit itself almost three quarters of a mile long; but my pot, and that of my fellow traveller, (Mr. Immelman,) happened to be at the distance of not above thirty or forty paces from each other. To these very places too, after we had waited at them an hour and a half, in the most profound silence, the enormous animals did not fail to resort. They had already, while on the other side of the river, got scent of the Hottentots, and now flewed, by their swimming up and down, and blowing themselves, as well as by a short but acute and piercing grunt or neighing noise, that they had a great satisfaction of the pails. I believe Mr. Immelman was not less eager and anxious than myself, each of us expecting at every moment to have a boat with a large enormous head, which we knew had given certain proofs of its being able to bite a man at a distance. Yet were we each of us at times no less fearful lest the other should have the honour of killing game of such consequence. The hippopotamus, however, left us, and had made its appearance in the same manner, where the farmers were stationed; notwithstanding which at that very instant, we heard it shot at by one of the Hottentots."

"The fable darkens of the night, and the glittering of the Hottentot's piece, together with the loudness of the report from it, occasioned by the weight of the charge, and the vibratians of the echo prolonging the sound along the neighbouring chain of mountains, all confused to compose a most awful and superb spectacle, which was fully heightened by the expen-
expectation of seeing an animal fall, superior in bulk to the elephant. This sublime spectacle was immediately followed by a ridiculous kind of farce performed by a troop of baboons, which, from their calling and answtering each other along a straight line, we could discover to be encamped on a steep rocky mountain in the neighbourhood, with regular outpools in the trees on each side of it. After an interval of a couple of minutes, silence again took place, till two o’clock, when the other Hottentot fired his piece; and another alarm, though of shorter duration, went through the baboons’ outpools and head-quarters.

"The next morning, for the arrival of which we ardently longed, in order to satisfy our curiosity, our Hottentot sportsmen related to us the following particulars concerning the adventures of the night. Involved in darkness, covered up to the eyes in reeds, and overshadowed with branches of trees, they could only get a glimpse of the animal, and consequently could not answer for their shots having taken place, and one of them acknowledged, that he was a little confused, as he could not well see what he was about, and for the same reason fired his piece too soon, before the animal had well risen out of the water. The other indeed had an opportunity, both with the ball and shot that made up the charge, of wounding the animal which went on its road and paused directly by him; but he could not see which part of the animal escaped the ball before the muzzle of his piece. As soon as he had fired he flaked away, and directly afterwards heard the beast take to the water. The rest of the Hottentots had observed one of these animals, probably a different one from this, run up on a shallow along the river side, and thus make its escape, without having been able to prevent it. After this we laid here till the afternoon, in hopes that the wounded animal would die, and rise to the top of the water. But we laid in vain, and thought it possible would it probably have been had we waited longer, as there grew by the side of the river a great number of trees, to the roots of which these creatures, it is said, in the agonies of death make themselves fast by means of their long and crooked tusk. On the other hand, supposing these two fea-cows to be but slightly wounded, they would be cautious how they made their appearance, and indeed, in all probability, it would have been a dangerous service to the sportman who would have ventured to have followed them any farther. Besides, the water had now, in the space of a few hours, risen considerably, and had overflowed many spots fit for lying in ambush; for which reason we departed to another hippopotamus pit, less than this. Here, too, we laid, by way of spare, a large blunderbuss. The Hottentots occupied one pit; two of our companions guarded another; other two (an old farmer and his son) stationed themselves at the third, and placed me in the middle of them. Just in this part the banks of the river were of a considerable height, and the river itself was dried up near an extensive shallow, where it was spread out into a little plain covered with pebbles, stones and gravel. We three then set ourselves down close to the side of each other, in a path made by the fea-cows, making ourselves pretty certain, as the place was flat, and consequently it was light here, of being able, if any hippopotamus should chance to come upon the shallow and look about it, to see it plain enough to kill it with a volley of three shots. But to the great endangering of our lives, we on a sudden found the animal much quicker in its motions as well as bolder than we had thought it; for while I was fitting half asleep and moralizing on the subject, struck with the consideration that we with our guns had at that present moment the dominion over Job’s leviathan or behemoth; while on the other hand the flies or small mquitoes had the dominion over us, (so much indeed, that I was obliged to wrap my face up in a handkerchief,) a fea-cow came rushing towards us out of the river with a hideous cry, as twift as an arrow out of a bow, at the same time I heard the farmer call out ‘Heer Jesus!’ But fortunately, at the very instant he discharged his piece, which hissing full in the animal’s face, contributed perhaps more than the ball to make it turn back; when setting up another cry, it threw itself into the water again with as great precipitation as it came out.

"At this I was not a little alarm’d, yet what is very singular, not at the danger, which was real, of being trampled under foot, or being bitten andauer by the beast, but in consequence of my apprehensions, which were merely imaginary, of being drowned; for the rattling noise arising from the creatures running out of the water, and along the flaxy beach, immediately forg’led to me the idea that the river had on a sudden overflowed its banks; a supposition to which I was the more inclined, as I knew that this accident very frequently happens here. And as to the hippopotamus, when it is newly come out of the water, and is wet and limy, it is said to glide in the moon-shine like a fish, it is no wonder that as soon as I took my handkerchief from before my eyes, it should appear to me at so near a view as I had of it, like a high column of water, which seemed to threaten to carry us off and drown us in a moment; for which reason I ran, or rather flew towards the higher ground, leaving both my guns and my brother centinels behind me. But as just at this spot I was prevented by the deepness of the river’s banks from ascending the heights, and nevertheless perceived that neither my companions nor myself were drowned, it ran in my head, for the space of several seconds, that we were all of us dreaming, or else delirious. The farmer’s son had fallen asleep, and still continued to sleep very soundly. As to the farmer himself, who, panting and breathless, every now and then looked up to heaven, and at the same time with much awkwardness and bungle was endeavoring to make its escape. I made all the haste I could to dissuage him from a large wrapper, which, as well on account of his gout as by way of keeping off the flies, he had wrapped round his legs. I then asked him what course the water had taken when it overflowed? and he, after a long pause, answered only by shaking me, in his turn, if I was not mad? Upon which I was almost ready to put the same question to myself. And even at last, when all this was unriduled to me, I could not help doubting the truth of it, till I found the farmer’s gun was really discharged; for the rattling among the flies, and the squalling in the water occasioned by the fea-cow, was what I first heard, and what made me take my legs; so that I did not in the least attend either to the report of the gun or the cry of the animal, though these latter appeared to the rest of our party the most terrible; so much indeed, that they occasioned Mr. Immelman, together with the farmer’s son-in-law, to fly from their pot, though they had seen nothing of all that had happened, and could not easily have come to any harm.

"On the twenty-fifth, from some traces of the fea-cows which we found in the dust near another spot, we concluded that many of these huge amphibious animals had lately taken up their quarters in a certain pit thereabouts; which we accordingly prepared to lay siege to in every possible way. In the mean time, we saw a young lion make its escape into a close thicket on the side of this same pit, where it might be perfectly safe from us and our hounds. Not much approving of this animal’s being so near a neighbour to us, we thought it well for several of us marksmen to be together at each hiding place; at the same time ordering our Hottentots, partly
HIPPOPOTAMUS.

Partly by making a noise and uproar, and partly by the means of making large fires, to frighten the sea-cows from attempting any of the other paffes. These animals had probably been beat in the same manner several times before, as this night we scarcely heard any thing of them. In the mean while, however, we flattered ourselves, that by continuing to block them up, we should, at least, by flaring them, force them to quit their asylum, and expose themselves on the land, to the fire of our guns.

"On the following day we were likewise on the look out after these animals, between the hours of ten and eleven in the forenoon, and also just before dark, though upon quite a different plan from what we had before, as we meant now to hit them on their mouts the instant they should fllick them up within the reach of our guns out of the water in order to take breath, or more properly (as it is not inaptly called by the colonists) to blow themselves. In order that the shot might prove mortal, we were obliged, however, on this occasion, to direct it in such a manner, that the ball should pass through the cavity of the nose into the brain. It was merely upon this plan that we went out after the sea-cows before we arrived at Agter Erntefhoogte, and were strengthened by the farmer’s party. But we foundly found these animals too shy to allow us to put our designs in execution; for although, in those places where they had not been frightened or wounded, they would often, in the middle of the day, raise their heads and part of their bodies above the surface of the water, they at this time scarcely ventured just to put out one of their nostrils, in order to breath almost imperceptibly; and this only for the most part in those spots in which they were sheltered from us by the hanging branches of trees. Notwithstanding this disadvantageous situation, they, in consequence of the acuteness of their smell, seemed still to discern us, as in that case they infantly wish to draw to another part. "The same night we betook ourselvs again to our polts, and at half an hour past eight, it being already very dark, a sea-cow began at intervals to put its head up above the water, and utter a sharp, piercing, and as it were, a very angry cry, which seemed to be between grunting and neighing. Perhaps this cry may be best expreffed by the words "beurk burkh lub-bub;" the two first being uttered slowly, in a hoarse, but sharp and tremulous sound, resembling the grunting of other animals; while the third, or compound word, is founded extremely quick, and is not unlike the neighing of a horse. It is true, it is impossible to express these inarticulate sounds in writing; but perhaps one may make nearer approaches to it than one can to the guttural-palatal sounds of the Hottentot language. At eleven o’clock came the fame, or else some other hippopotamus, and, in like manner, visited the pofts we occupied. He did not, however, dare to come up, though, to our extreme mortification, we heard him come and nibble the boughs which hung over the surface of the water, as well as a little grafs, and a few low shrubs which grew here and there on the infe of the river’s banks. We were, however, in hopes that this way of living would not long suffice animals, one of which only required almost a larger portion than a whole team of oxen. Thus far, at least, is certain, that if any one should calculate the consumption of provifions made by a sea-cow from the size of its fauces, and from that of its body and his belly, which hangs almost down to the ground, together with the quantity of grafs."

"If we passed the following night at the fame pofts as we occupied on the night preceding, the sea-cows setting much in the fame manner as before. On the 28th after sun rife, just as we were thinking of going from our pofts home to our waggons, there came a female hippopotamus with her calf from some other pit or river, to take up her quarters in that which we were blockading. While she was waiting at a rather steep part of the river’s banks, and looking back after her calf, which was lame, and confequently came on but slowly, she received a shot in her side, upon which she directly plunged into the water, but was not mortally wounded; for Hip, (the farmer’s son,) the drowf of all fublunar beings, who had flot her, and that infant could hardly be awakened by two Hottentots, was still half asleep when he fired his piece. And happy was it for him that the enormous beast did not make towards his hiding, or rather fleeping place, and fend him into the other world to sleep for ever. In the mean while his shot was far fo of service, that one of my Hottentots ventured to seize the calf, and held it fast by its hind legs, till the rest of the hunting party came to his aflillance. Upon which the calf was bound fast, and with the greatefl joy borne in triumph to our waggons; though while they were taking it over a shallow near the river, the Hottentots were very much alarmed, left the wounded mother and the other sea-cows should be induced, by the cries of the calf, to come to its rescue; the creature, as long as it was bound, making a noise a good deal like a hog that is going to be killed, or has got Salt between two polts. The found, however, proceeding from the hippopotamus-calf was more thrill and harth. It thew likewise a considerable fhare of strength in the attempt it made to get loose, and was found to be quite unmanageable and unwieldy; the length of it being three feet and a half, and the height two feet; though the Hottentots supposed it to be no more than a fortnight, or at molf, three weeks old. When at last it was turned loose, it ceased crying; and when the Hottentots had passed their hands several times over its nose, in order to accustom it to their effluvia, began directly to take to them." "While the calf was yet alive, I made a drawing of it, a copy of which may be seen in the Swedifh Transations for 1778. After this, it was killed, difsected, and eaten up in lefs than three hours time. The reafon of this quick difpatch was partly the warmth of the weather, and partly our being in abolute want of any other fresh provifions. We found the flefh and fat of this calf as foby as one might have expected from its want of age, and consequently not near fo good as that of the old sea-cows; of which I found the flefh tender, and the fat of a tafle like marrow, or at leat not fo greedy and ftrong as other fat. It is for this reafon the colonists look upon the flefh and fat of the sea-cow as the whole dominion that can be eaten; the gelatinous part of the feet in particular, when properly defried, being accounted a great delicacy. The dried tongues of these animals is confidered, even at the Cape, as a rare and fawsery dith. On my return to Sweden, I had the honour to furnish his majefly’s table with a dried sea-cow’s tongue, two feet eight inches long. With refpect to form, the tongue of a full grown hippopotamus is very blunt at the tip, and is in fact broadleaf at that part; if, at the fame time, it is flantted off at one fide, and marked with many_leafes, as I was informed it, this circumstance may, perhaps, proceed from the friction it fuffers against the teeth, towards the fide on which the animal chiefly chews; at leat, some traces of this oblique form were discoverable on the dried tongue I am speaking of."

The food of the hippopotamus, according to Dr. Sparrow, consists entirely of herbs and grafs. In the ancient transcriptions, of which we are informed by father Lobo, and which may partly be inferred from the figure of the Stomach. Hence this writer thinks it very improbable the hippopotamus
amus should ever hunt after fish, as is asserted by Buffon and Dampier; and this the more especially, as in some of the rivers in the southern parts of Africa, where the sea-cows are daily seen in great abundance, there is no fish; and in others which they inhabit, only a few "bollard springers" (cyprinus gonorynchus), which are scarcely larger than the common herring. "It is true," (says Dr. Sparrman,) that the sea-cows sometimes frequent the mouths of the rivers here, which are full of sea-fish, and even sometimes the sea itself: we know, however, that these huge quadrupeds are, notwithstanding this, obliged to go from thence upon dry land in quest of food. Neither is it probable that they can drink fresh water, as an infallace was related to me of the contrary in a hippopotamus, which having taken refuge in the sea, and yet was obliged to go ashore every night, and drink fresh water from a well in the neighbourhood, till at last it was shot by some people that lay in wait for it there. That the hippopotamuses actually lived in salt water, I have seen evident proofs at the mouths both of the Kromme and Couantour rivers, particularly the latter, on my journey homewards; where many of these animals boiled themselves in broad day-light, and thrust their heads up above the water; and one of them in particular, which had been shot at, denied the ill-directed shot on the nose, and fell without anyone to refresh and refreshment. In Krakekamuna, I saw on the beach manifest traces of an hippopotamus, which had come out of the sea, but had retired thither again directly. That very attentive navigator Capt. Burtz informed me, that he had frequently seen, on the eastern coast of Africa, sea-borbes (meaning probably the hippopotamus) raise their heads above the surface of the water, in order to blow themselves and neigh. I have been induced to be rather circumstantial on this subject, as M. Adanson had taken it into his head, in his "Voyage au Senegal," to limit the abode of the hippopotamus to the fresh-water rivers only in Africa; and M. de Buffon has taken upon him to support this opinion, and to render Koble's testimony to the contrary liable to fulmination.

The method of catching the hippopotamus consists (besides shooting it) in making pits for it in those parts which the animal passes in its way to and from the river; but this method is productive of the Hottentots, and is only practised by them in the rainy season, as the ground in summer is too hard for that purpose. It is said that they have never succeeded in killing this huge aquatic animal with poisoned darts, though this mode of killing game is practised with advantage by the Hottentots, for the destruction both of the elephant and rhinoceros. The coloines, likewise, were not entirely unacquainted with the method mentioned by M. Hafflquin, as being common in Egypt, c. to throw on the ground as many peas or beans as the animals can possibly eat, by which means it buries its belly and dies. But as this method is very expensive, and they can generally have this animal for a single charge of powder, and a tin ball, shot in a proper direction, they chiefly, and almost entirely have recourse to this cheaper expedient.

Not on his own authority, but on the assurance of old experienced hunters, Dr. Sparrman tells us the hippopotamuses couple in the same manner as the common cattle. A brother sportsman, said he, once observed a peculiar kind of vermin on the body of an hippopotamus. These amphibious animals are likewise much infested with internal worms, one of which, found on the calf before-mentioned by Dr. Sparrman, he describes as being a kind of leech of about an inch long, the colour blackish, with a brownish line down the back, and the lower surface pale brown. With regard to its food, this writer imagines the adult animal may be not very choice, as the calf, apparently pressed by hunger, was observed to eat the dung of one of the oxen belonging to their party.

"Having already (says Dr. Sparrman) exceeded the limits I had prescribed to myself, I do not intend to dwell here on the anatomy of the hippopotamus we caught, particularly as the internal disposition of the cow differed so much from that of the adult animal. I shall, therefore, only briefly mention the following particulars: the flomachs were four in number, and consequently one more than in the fatus examined by M. Daudenton, which was kept in spirits. The two first flomachs were each of them about seven inches long, and three inches in diameter; the third nine inches in length, and a little wider than the two former; the fourth was seven inches long, and at the upper part five inches broad, but decreased by degrees on one side till it terminated in the pylorus, which had an aperture an inch wide, being about half as wide again as the cardia. I did not observe any such valves as M. Daudenton has delineated. The first flomach we found mostly empty, it containing only a few lamps of cheese and curd; it likewise differed from the rest by the superior beauty of its internal coat. The internal membrane of the second flomach was rather coarser, and had many small holes in it; it likewise contained several elevations of caudose matter, together with a great quantity of sand and mud. The third flomach had very visible folds, both longitudinal and transverse, on the inside of it, and contained caudose lumps of a yellow colour, and harder consequence than the others, together with several leaves quite whole and fresh, and at the same time some dirt. The interior membrane of the fourth flomach was very smooth, though it was not without folds; in the flomach itself there was a good deal of dirt, with a small quantity of cords, which were whiter than they were in any of the other flomachs. The fourth flomach in a great measure covered the reft, being situated on the right side of the animal, and was found to have the upper part of the melt adhering to its superior and inferior edge. This latter viscus, when was one foot long and three inches broad, diverged from it downwards on the left side. The intestinal canal was 19 feet long; the liver measured fourteen inches from right to left, and seven or eight from the hind to the fore-part, on its anterior edges it had a large notch, being in other respects undivided and entire; it was of an oblique form, being broadest towards the right side, where I discovered a gall-ladder five inches in length. In the uterus there were two teats, and the heart surrounded with much fat; the length of this muscle was five inches, and the breadth about 4½ inches and a half. The communication between the auricles, called the foramen ovale, was above an inch in diameter. Each lung was eleven inches long and undivided, but at the superior and exterior part of the right lung, there were two globules or processes, elevated half an inch above the surface; and on the side corresponding to it, in the left lung, and in the upper part of it, there was a little excrescence terminating in a point: somewhat below this, yet more forwards, there was found likewise a process half an inch in height. Directly over the lower part of the communication formed between the right and the left lung, there was a kind of crest or comb, measuring an inch from the top to the base."

**Hippopotamus L.** The Zoologists are acquainted with one living species of hippopotamus only; but late observations have proved that the bowels of the earth contain...
tain the fossil remains of two perfectly distinct species, one of which appears not to differ in any respect from the one still existing; the other, being, as it were, a miniature copy of the larger, is nearly of the size of the wild boar. The discovery of this latter we owe to the indefatigable Cuvier, who has likewise proved the existence of the other species in a fossil state. Several authors, prior to that celebrated naturalist, have mentioned fossil bones of the great African hippopotamus, but subsequent observations have proved that they had been rather too rash in forming their diagnoses. Some of the teeth described by Daubenton as the molares of the hippopotamus, are proved by Cuvier to be those of the maldodonte, or the great American animal improperly called mammoth. Peter Camper, who has given an account of fossil teeth of the hippopotamus, appears to have fallen into the same error as Daubenton. Merk likewise describes a tooth of a hippopotamus found in the neighbourhood of Frankfort on the Mayn, which turns out to be a worn out intermediate tooth belonging to the same American animal. The tooth of a hippopotamus, mentioned by Deluc as having been found among the volcanic productions in the vicinity of Frankfort, is, according to Merk, nothing but the tooth of a rhinoceros. The teeth which Lang has figured under the name are probably those of a horse, partly undeveloped, partly worn off. Also, Romé de l'Isle, de Lametherie, and Faujas St. Fond were led into error with regard to the teeth they described as belonging to the river horse. Some writers, on the other hand, have been in the possession of real fossil remains of the hippopotamus without being aware of it. Thus Aldrovandus has figured several molares of this animal under the name of elephant’s teeth, while the real elephant’s tooth, of which he has likewise given a representation, was considered by him as belonging to some large unknown animal. The only authors who have been more correct, both in the application of the name of hippopotamus, and in their observations respecting the fossil remains of the animal in question, are Antoine de Jussieu and Daubenton: the fossil bones described by the former as early as 1724, cannot be doubted to be really those of the river horse; and those indicated by Daubenton under the same name, and deposited (promiscuously with others, which, as above-mentioned, belong to the maldodonte) in the museum at Paris, were the first that served to convince Cuvier of the existence of fossil remains of

1. The great or common Hippopotamus.—One of the last-mentioned species of the genus remains confuted in a portion of the right side of the lower jaw containing two molar teeth; the other in a single molar tooth. The place where they are found is not known with certainty. A third specimen, examined by Cuvier, is a fragment of the upper jaw, with two molar teeth, in the collection of M. de Drie; it is penetrated by a ferruginous substance, but does not bear any indication of its origin; it is not, however, improbable that it was found in the neighbourhood of Montpellier.

More satisfactory than the preceding specimens, with regard to its locality, was one in the collection of M. Miot. This bone, which was known to have been gathered in the Val d’Arno, in Tuscany, is an altrargalus, resembling that of a hog, to which animal the hippopotamus approaches more than to any other, with regard to the conformation of all its parts. The place where bones of the hippopotamus are actually found being thus ascertained, Cuvier applied to Fabroni at Florence, who lent him drawings of two molar teeth, and one representing a fragment of a tusk or canine tooth, which Cuvier soon ascer-

H I P

tained to belong to the animal in question. Respecting the canine tooth, it is observed by Fabroni, that it differs from that of the African hippopotamus in its diameter being greater compared with its length, and also in its spiral curvature being much more dinita. He adds, that these teeth are scattered in various parts of the upper valley of Arno, but unaccompanied either by jaws or other bones.

Cuvier thinks there is no material difference either between these fossil teeth or the altrargalus he has examined, and those of the living species; and, indeed, it is remarkable, that the animal, whole existence in a fossil state had at first appeared doubtful to geologists, should be one whole fossil remains far more strikingly resemble the bones of the still existing species, than is the case with any other fossil remains which naturalists have referred to living animals, such as the elephant, the rhinoceros, &c.

2. The small fossil Hippopotamus.—The mass out of which Cuvier extracted the remains of this species, (but the geological relation of which is unfortunately unknown,) resembles the omissive breccia of Gibraltar, Dalmatia, and Cete, except that the matrix, instead of being calcareous and fossiliferous, is a homogeneous sandstone, which uniformly fills up all the intervals between the bones; the bones also form a far more considerable portion of the mass than is the case in the Gibraltar rock. After having performed the difficult operation of disengaging all the separate ossaceous fragments, M. Cuvier found that they belonged to an animal, of which no traces had hitherto been discovered, but which was unquestionably a congener of the common hippopotamus. The teeth were found to agree in all essential points with those of the other species; and the remainder of the ossaceous fragments which were next examined, confirmed, without a single exception, what had been indicated by the characters of the teeth.

For a detailed description, together with the representation of the fossil bones of both thefe species of hippopotamus, we refer to Cuvier’s Memoir, in vol. v. of the Annales du Museum National d’Histoire Naturelle.

HIPPODISIS, in the Writings of the Ancient Physicians, signifies a reducing any part of the body into its natural situation, by means of compulsion.

HIPPOPOTARUS, in Natural History, the name given by authors to a creature generated between a bull and a mare. It seems a very unnatural copulation; but Wagner, in his History of Switzerland, affirms us, that the creature produced by it is sometimes found wild in the mountainous parts of that country.

HIPPURIS, in Botany, is a name adopted by Linnaeus from the ancients, in preference to one that had been given to this same genus by Vaillant and Dilleni- nius. The original HEPHEUS of Dioscorides is evidently, from his description of both species, an Equusasinum, (see that article.) The present plant has great affinity to that genus in habit and place of growth, though differing materially in its generic characters. Its name is compounded of HEPHEUS, a horse, and orisin, a tail. Mr. Curtis has remarked that “Hippuris of Linnaeus is Polygammum lived. Poly- gnamum feminina, of Dioscorides, arranged by his commen- tator Matthiolus with our Polygnum aviculare, and Herniaia. Succeeding botanists, imagining, from the growth of its leaves, or from its producing feed, that it had better pre- tendions to be ranked with the Equusasinum, absurdly enough called it Cauda equina feminina, to which Mr. Hudson could not well avoid giving the English name of Mare’s-tail.” This genus was denominated Linneus by Vaillant and Hailer, and Pinus by Dillenius.—Linna. Gen. 5.

K. Schreb.

Gen. Ch. Cal. Perianth superior, obfolute, undivided, or
flightly two-lobed. Cor. none. Stam. Filament one, erect,
inferted on the top of the germen; anther roundish, two-
lobed, comprefsed. Pf. Germens oblong; style awl-shaped,
ecrét, longer than the flamen; &fligma fimple, acute. Peric.
one. Seed only one, roundish, naked, rather bony, covered
fimple. Seed one, inferior.

t. 763. Curt. Loud. Favo. 4. t. 1.—"Leaves whorled, nu-
merous, linear."—A common inhabitant of ditches, pools,
and streams which are not very rapid, in Norfolk and the
neighbourhood of London, flowering abundantly in May
and June. In other parts of England it is of rarer oc-
currence, seeming to delight in a gravelly foil.—Rott confif-
ing of long verticillate fihres. Stem entirely fimple, round, of
a reddih tinge, and closely fet with fhorcs of linear, entire,
smooth leves, about eight or more in a whorl. Flowers
axillary, ferial, and of very fimple ftructure, for they
confist of only an oval germen, crowned with an almost
imperceptible marf or calyx, without a corolla, and terminat-
ing in a fimple, thread-shaped, pointed flyle, by whom fide
stands one fimple flamen with a two-lobed anther. The
flermen becomes a fingle naked feed.

2. H. tirophylla. Linn. Suppl. 81. (H. lanceolata; Retz.
Retz. Prod. 2.)—Leaves four or five in a whorl, elliptical,
obfute. This was fent to Linneaus by professor Lecce of
Abo, in Finland, in which neighbourhood it is faid to have
been first difcoverfed by a Mr. Schullen. It is remarka-
bale that Pallas fent it from Kamfchatka as a new Elatin,
enquiring of Linneaus if it were different from the Altingifirum,
though his fpecimens moft evidently difplay the flowers of an
Hippurus, with their flamen and flyle in full perfefion. This
has the habit of the fpecies just defcribed, differing only in
the fennets of leves in each whorl, and their broad, ellipti-
ical shape. Whether it has in winter any difference of ap-
pearance in foliage, like the tarner, whose inmerfed leves
at that feeon are peculiarly elongated and pellucid, we have
no information. Retzus, in his fpecifus above quoted, con-
cludes that this genus is gyandrous.

Hippurus, in Ancient Geography, an ifland of the Archi-
pelago, being one of the Cyclades.

Hippuriscus, an ifland of Aifa, on the coast of
Caria.

Hippurites, in Natural History, a name given by
fome writers to a floie which they fancy to repreffent a
faddle. It is defcribed to be a foft artiligloune floie, own-
ing its figure of a faddle to certain defcriptions. This is
only a fpecies nature, and is of the nature of the hand-flones,
and foot-flones, with feveral others, which fancy has affifted
in their refemblances, but which have been very improperly
called by particular names.

Hippurus is also a name which Dr. Grew applies to
a fofial plant of a fowy texture, confifting of three flals
elegantly figured, to reffemble the equifetum or horfe-tail

Hippurus, in Ichthyology, a fpecies of Corvifena,
which fee.

Hippus, in Medicine, a diforder of the eyes, wherein
they continually shake and tremble, and thus repreffed
objects as if continually fluctuating.

It is thus called from the Greek ἴππος, bôre; because,
according to Blanchard, objects appear to shift in it, as
much as when we are riding.

Hir, in Geography, a town of Perfia, in the province of
Peria; 18 miles S. of Sirjan.

Hira, or Alexandria, Mejid-ali or Mehem ali, in An-
cient Geography, a town of Aifa, near a lake, at fome dif-
tance from the right bank of the Euphrates: the refeence
of a dynasty of princes, who ferved the Perfians and Par-
thians againft the Romans.

Hirabad, in Geography, a town of Perfia, in the pro-
vince of Irak. N. lat. 32° 16'. E. long. 55° 50'.

Hirâ, in Botany, fo called by Jacquin after John
Nicholas de la Haire, a French phyfological writer in the
Memoires de l'Acad. des Sciences, whose refemblings are some-
times cited by Du Hamel and others; and who discovered
an exfending refeembling manna on the leaves of orange-trees.

t. 2. (Flabellaria; Cavan. Diff. 436. Triopteris Hirâ; 
Geartn. t. 116.)—Clafs and order, Decanidia Trigynia,

Gen. Ch. Cal. Perianth inferior, of one leaf, small,
ecrét, in five deep segments, permanent, without any nect-
ariferous external glands. Cor. Petals five, roundish,
dconcave, widely spreading, with long linear claws. Stam.
Flaments ten, awl-shaped, erect, slightly connected at the base,
five of them alternately shorter; anthers erect. Pf. Ger-
mens three, superior, ovate, connected; flyles awl-shaped,
ecrét; fligmas capitate or cloven. Peric. Capsules three,
roundish, not burling, with two very large, tranverse,
rounded wings, sometimes united, and a smaller longitudinal
central one. Seeds solitary, ovate.

Eafh. Ch. Calyx in five deep segments, without any
honey-pores. Petals roundish, with claws. Flaments con-
ected at the base. Capsules three, closed, fingle-feed, with
two or three unequal wings.

Orth. This genus has been confused with Triopteris,
and it is doubtful whether they ought not to be united, ac-
cording to the sentiments of Geartn and Julifon. The
chief difference lies in the two nectariferous glands or pores,
said to diftinguish the calyx of Triopteris, and its narrower,
more vertical, and more divided wings.

t. 116. Linn. Mant. 240.—Leaves obovate, blunt at each
end, smooth beneath.—Gathered by Jacquin in woods at
Carthagena in South America, flowering in June, and ri-
pening feed in September. It is a weak and trailing furlb,
feldom rifting to the height of more than fifteen feet, and
riffing its long, plant, smooth branches upon the neigh-
bouging bushes. The bark is grey. Leaves opposite, ob-
long, somewhat obovate, blunt at each end, entire; smooth
beneath; cloathed with left, deprefled, fiercely visible hairs
above. Their length is from three to fix inches. Fohnfolks
short, with a pair of brifle-shaped fipulas at the base.

Flowers yellow, beautiful, an inch bread, in very long,
compound, terminal clufers.

2. H. odorata. Willd. n. 2.—"Leaves ovate, acute;
smooth above; downy beneath."—Found by Ifert in Gui-
nea.—A furlb. Leaves opposite, ovate, acute, entire, veiny;
dark
dark green and smooth above; clothed with yellowish flaggy close down beneath. **Clifford** copious at the ends of the branches, axillary, forming a terminal leafy panicle, with downy stalks. The flowers are said to be fragrant. Frut exactly like the following. Wildne... 3: H. pinnata. Wild. n. 3. (Flabellaria pinnulata; Cavan. Diff. 436. t. 264.) — "Leaves pinnate with an odd one, ovate-oblong, alternate, smooth on both sides." — Gathered by Smeathman at Sierra Leone. About this plant there is much obscurity. Nothing brought by Smeathman answers to it, but some fragments of his will agree with the preceding description, except that the backs of the leaves are rather flaky than yellowish. Cavanilles may very reasonably be suspected of a mistake with regard to the leaves, no plant of this natural order being known to have either compound or alternate foliage. We are therefore strongly persuaded that this supposed species is no other than the former.

HIRAM, in Geography, a po-it-town of America, in York county, Maine, containing 184 inhabitants.

HIRARA, in Zoology, the name of an animal of the Braflis, much resembling the hyena.

HIRCANA. See Hircania.

HIRCUS, Trages, or Goat, in Anatomy, a part of the aurioue, or outer ear; being that eminence next the temple.

HIRCUS, in Astronomy, a fixed star of the first magnitude, the fame with Capella.

HIRCUS is also a denomination given to the rank smell exhaling from the arm-pits; and which has its source in the axillary glands.

HIRCU, also used by some writers for a comet, encompassed as it were with a mane, seemingly rough and hairy.

HIRE, PHILIP DE LA, in Biography, an eminent mathematician and astronomer, was born at Paris in the year 1640. His father took great care in having him instructed in those branches of mathematics which should lay a foundation for the study of the fine arts. After the death of his father, which took place when the son was only seventeen years of age, he passed some years in Italy, spending his time chiefly in the study of the mathematics, to which he devoted himself with the greatest ardour. On his return to Paris he made himself known to the public by the second part of a treatise on stone-cutting, printed in 1672, in continuation of Gerard d'Argues on the same subject. The reputation which he acquired by this performance, he encreased by his "Nouvelle Methode en Geometrie pour les Sections des Superficies coniques et cylindriques," and his treatise "De Cycloide." In the year 1678 he was elected member of the Academy of Sciences, and in the following year he published "Les nouveaux Elements des Sections Coniques?" "Les lieux Geometriques." "La Construktion ou Efection des Equations." In the same year, under the auspices of Colbert, he commenced an undertaking, conjointly with M. Picard, in order to collect materials for a more correct general chart of the coast of France than had been before laid down; and visited the province of Bretagne, where the two mathematician made the surveys and observations requisite for their design. In 1680 they proceeded to the coasts of Guianne and Gascogne, and in 1681 M. de la Hire was directed to proceed alone to Calais and Dunkirk, in order to determine the exact positions of those places. On this occasion he took the opportunity of measuring the exact breadth of the straits of Dover, which he found to be 21,350 toises. In 1682 he furnished his share of the undertaking, and on his return to Paris he published his treatise "De Gnomonique," which he reprinted in 1698, in an enlarged form. From this time he frequently appeared before the public in the character of an author. And the diversity of his productions, and his continual employments, gave us some idea of the great labour which he must have undergone. His days, says his biographer, were almost uniformly spent in close study, or in discharging professional engagements, and a considerable part of his nights was frequently devoted to astronomical observations. Seldom did he enjoy any other relief from his labours than what arose from the exchange of one employment for another; nevertheless his health was generally good, till within a month of his death, which took place in 1718, after he had completed his 75th year. He was regarded as an honest and disinterested man, and as a good Christian. Moreri. Hutton.

HIRLAW, or HARLEY, in Geography, a town of Mol- davia, on the Bechului; 30 miles N.W. of Jassy. N. lat. 47° 24'. E. long. 27° 6'.

HIRMUND. See HERRMUND.

HIRPI, in Ancient Geography, a name distinguishing a number of families of Italy, at a small distance from Rome, in the territory of the Falisci, who every year marched over burning wood to mount Soracte, in order to offer a sacrifice in honour of Apollo. It is said that, on this account, they were exempt from going to war, and from all other charges. They are described in Virgil's 'Eneid.' 1. ii. v. 785:

"Summe Deum, sancti cultus Soracitis Apollo Quam privis colimus, cuin pines arbor acervo Pucitum, et Medium freti pietate per ignem Cultores multa præminit vestigia pruna."

Varro says, in speaking of this practice of the Hirpi, that they applied some preparations to their feet in order to prevent their being burnt.

HIRPINIS, a people of Italy, who formed a part of the Samnites; and as the term Hirpus signifies in the Samnite dialect a wolf, they are said to have migrated to their new habitations by tracing the steps of these animals. It was towards the end of the second Punic war, that the Hirpini began to be distinguished from the other Samnites. Their territory comprehended the towns of Beneventum, Caudium, Abellinum, and Campsa.

HIRRIA, in Geography, a town of Hindoostan, in Rohilkund, 28 miles S. by E. of Oscope.

HIRSCHBERG, a town of Bohemia, in the circle of Boleflau; 12 miles N. W. of Jung-Bunzel.—Also, a town of Silefia, in the principality of Jauer, and next to Breslau, the town of the most considerable trade in Silefia, having many manufactures both in the town and neighbouring villages. The churches in the town belong to the Roman Catholics, but the Lutherians have purchased the privilege of erecting a church and school without the walls. It has been once and again burned and pillaged; 20 miles S. W. of Jauer. N. lat. 50° 44'. E. long. 14° 48'.—Also, a town of Saxony, in the Vogtland; 14 miles S. W. of Plauen. N. lat. 50° 20'. E. long. 11° 58'.—Also, a town of Bavaria, in the principality of Aichlacht, 22 miles N. E. of Aichlacht.

HIRSCHFELD, a town of Saxony, in the circle of Erzgebirg; seven miles S. of Zwickau. Also, a town of Lusatia, on the Neisse; 40 miles E. of Dresden. N. lat. 50° 56'. E. long. 14° 39'.

HIRSCHLOM, a town of Denmark, with a castle, in the island of Zealand, where Christian VI. died in 1746; 12 miles N. of Copenhagen.

HIRSEL, in Rural Economy, a term employed among
the northern flock-mutters, to denote the division of sheep into particular kinds.

HIRSON, in Geography, a town of France, in the department of the Aisne, and chief place of a canton, in the district of Vervins; four miles N. E. of Vervins. The place contains 2150, and the canton 11,127 inhabitants, on a territory of 185 kilometres, in 13 communes.

HIRST, in Mining, Ridge or Sow's-back, is applied by the colliers of Scotland, (see Willem's Min. 2d ed. t. 90.) to the tops or higher parts of undulating strata, or those which lay in Hill and Trough, see that article.

HIRTELLA, in Botany, so named by Linneus, as he himself informs us, in the Hortus Cliffortianus, p. 17, from hirtus, hairy, because of the hairiness of its young branches.

Gen. Ch. Cal. Perianth inferior, of one leaf, its border in five deep, nearly ovate, spreading, unequal, permanent segments. Cor. Petals five, roundish, concave, slightly spreading, equal, deciduous. Stam. Filaments five, sometimes but three, inserted into the calyx, one on one side, very long, broad, thread-shaped, flatish, permanent, at length rolled into spiral, anthers oblong, of two lobes. Pist. Germen superior, roundish, compressed and flopping, hairy; style thread-shaped, as long as the stamens, arising from the depressed side of the germen opposite to the stamens, near the bottom; stigma simple. Peric. Berry oval, swelling upwards, slightly compressed, somewhat triangular, the style and much of the hairiness which clothed the germen remaining attached to its base on one side. Seed one, large, shaped like the pericarp. Aublet describes it as a nut of two cells.

Ell. Ch. Calyx with five permanent segments. Petals five. Filaments inserted into the rim of the calyx, very long, permanent, spiral. Style lateral. Berry superior, with one seed.

The history of the species is singularly confused. We shall endeavour to collect under one view all that has been said of them.

1. H. americana. Willd. n. 1. Swartz. Obs. 94. Aubl. Guin. v. 1. 247. p. 98. —Clumps upright, simple, axillary; their common stalk villoso. Leaves oblong, pointed. Stamina five. —Native of Cayenne and Guiana. A tree 25 feet high or more, and six inches in diameter, with a reddish bark. Branches long, slender, flattered, and subdivided. Leaves alternate, oval, long-pointed, entire, smooth and green; the largest of them six inches long by 2 1/2 broad. Flowers very short, with a pair of awl-shaped, downy, deciduous filiparas. Clusters axillary, long, hairy, reddish; their partial petals alternately, with one or two little scale-like bracteas at their base. Segments of the calyx reflexed. Petals blueish, emarginate. Stamina five, all on one side of the flower, very long, blueish upwards, as are likewise their anthers. Style rough in its lower part with red hairs. This tree flowers in March. Swartz and Willdenow seem to depend entirely on Aublet for this species, yet they take it for the original one of Linnaeus, which he saw in Piso's herbarium, and which had five stamens. However this may be, what he describes in the Hortus Cliffortianus had but three, and should seem to be different. What he quotes in the Species Plantarum, ed. 2. 290. from Maregravo's Brasi, t. 78. f. 2, and which he says is bad, does not at all agree with any Hirtella.

(H. americana; Jacq. Amer. 8. t. 81.) —Clumps compound, terminal, foliary, downy, loosely spreading. Leaves elliptic-oblong, pointed, naked on both sides. Stamina three. —Native of woods, by the sides of torrents in Jamaica, Hia-

—number H. Irudella Marina, in Natural History, the name of a very remarkable little animal of the leech kind. The body of this creature is roundish and oblong, and adorned with many longitudinal lines or furrows; it is about an inch in length, and is of a greyish colour, and somewhat transparent; the bowels are seen through the skin, and appear at first sight like streaks on its surface; in the middle of the belly

H. oblong, pointed, heart-shaped at the base; downy beneath. Stamina three. —Native of the West Indies? The leaves exactly resemble those in Aublet's figure of H. americana, both in size and figure, but are rough with rusty down at the back. The clusters are above a foot long, solitary, terminal, flaked, clothed all over with a fine white downy, the flowers of the calyx on one side, very long, broad, thread-shaped, flatish, permanent, at length rolled into spiral, anthers oblong, of two lobes. Pist. Germen superior, roundish, compressed and flopping, hairy; style thread-shaped, as long as the stamens, arising from the depressed side of the germen opposite to the stamens, near the bottom; stigma simple. Peric. Berry oval, swelling upwards, slightly compressed, somewhat triangular, the style and much of the hairiness which clothed the germen remaining attached to its base on one side. Seed one, large, shaped like the pericarp. Aublet describes it as a nut of two cells.

Ell. Ch. Calyx with five permanent segments. Petals five. Filaments inserted into the rim of the calyx, very long, permanent, spiral. Style lateral. Berry superior, with one seed.

The history of the species is singularly confused. We shall endeavour to collect under one view all that has been said of them.

1. H. americana. Willd. n. 1. Swartz. Obs. 94. Aubl. Guin. v. 1. 247. p. 98. —Clumps upright, simple, axillary; their common stalk villoso. Leaves oblong, pointed. Stamina five. —Native of Cayenne and Guiana. A tree 25 feet high or more, and six inches in diameter, with a reddish bark. Branches long, slender, flattered, and subdivided. Leaves alternate, oval, long-pointed, entire, smooth and green; the largest of them six inches long by 2 1/2 broad. Flowers very short, with a pair of awl-shaped, downy, deciduous filiparas. Clusters axillary, long, hairy, reddish; their partial petals alternately, with one or two little scale-like bracteas at their base. Segments of the calyx reflexed. Petals blueish, emarginate. Swartz and Willdenow seem to depend entirely on Aublet for this species, yet they take it for the original one of Linnaeus, which he saw in Piso's herbarium, and which had five stamens. However this may be, what he describes in the Hortus Cliffortianus had but three, and should seem to be different. What he quotes in the Species Plantarum, ed. 2. 290. from Maregravo's Brasi, t. 78. f. 2, and which he says is bad, does not at all agree with any Hirtella.

(H. americana; Jacq. Amer. 8. t. 81.) —Clumps compound, terminal, foliary, downy, loosely spreading. Leaves elliptic-oblong, pointed, naked on both sides. Stamina three. —Native of woods, by the sides of torrents in Jamaica, Hia-

—number H. Irudella Marina, in Natural History, the name of a very remarkable little animal of the leech kind. The body of this creature is roundish and oblong, and adorned with many longitudinal lines or furrows; it is about an inch in length, and is of a greyish colour, and somewhat transparent; the bowels are seen through the skin, and appear at first sight like streaks on its surface; in the middle of the belly
belly there is a remarkable protuberance, which, when closely examined, is found to be a muscular body in form of a spherical bladder; this, when most distended, has the appearance of a spherical air-pump, and has all the properties of that machine, to be employed for the service of the animal, and at its pleasure. It resembles, in its external figure, the cup of an acorn, with the mouth a little contracted. The head of the animal is of the same figure with that of the common leech, and serves to suck the juices of other animals in the same manner as in that insect. The part of the body which reaches from the head to the middle protuberance is of a very irregular form, frequently in motion, and continually changing its figure; but the other part moves more slowly, and less frequently, and preserves its shape unaltered. The protuberance has two motions, expansion and undulation.

When the creature has a mind to fix itself anywhere, it does by means of this protuberance, which it applies closely down to the substratum, and void of air. Hence the external air so firmly prehends its sides against the substratum, that it is not easy to remove it. When the creature changes its place, it draws the head round to the protuberance, and looses it so as to be able to change its place as it has occasion.

When this creature is kept out of water, it dies in a few hours; and when after being thus kept out a few minutes, it is put into sea-water, it immediately darts out a fine green thread from its mouth; this it usually makes of the length of its body, or thereabouts, though it varies it occasionally; and by means of this it suphends its body any length that it pleases in the water. It seems to be calculated only for living in the bodies of fish, for the sea-water soon kills it; and it is observed to diminish its bulk very feebly all the time that it is kept in it. Phil. Trans. No 410.

HIRUDO, in Zoology, a genus of Vermes, the body of which is oblong, truncated at both ends, unarmed, and cartilaginous; and the progressive motion is effected by dilating the head and tail, and contracting itself into an arch. Lin. To this essential character it should be added, that the two extremities of the true hirudo are capable of being dilated into a fishy disk, by means of which it can affix itself firmly to the skin of animals, and the mouth, which is triangular, situated under the anterior part of the body.

This is a genus of aquatic worms, known in England by the name of leech; several of its species inhabit our waters, and two in particular, the common or medicinal leech, and the horbe leech, are so well known as to be familiar to every one. The body in the leech tribe is compos'd of a great number of rings; the skin more or less smooth, and the head, when in a state of contraction, more pointed than the tail; the opening of the mouth is triangular, and armed with three strong teeth, besides a numerous effenblage of smaller ones, and a fücker at the bottom, by the assistance of which it draws the blood from the wound inflicted by this formidable armament of teeth in the flesh of the bleeding animal. The teeth of the leech are powerful enough to penetrate not only through the skin of man, but also that of horses and cattle, examples of which very frequently occur when the latter bathe in the water. The hirudo tribe respire by the mouth. The greater portion of the species are furnished with eyes, the number of which however varies according to the species, being sometimes eight, in others six, and again in others no more than two. Every individual of the leech tribe, like those of the snail, is complete in its own conformation, being, as Redi observes, of both sexes, and often producing their young alive. Their common sub-

fluence is the blood of quadrupeds, and other fanguineous animals which they casually meet with in the water, and which, as they can bear an abstinence of some weeks or even months, they generally find in sufficient abundance. Should it prove otherwise they prey on worms and the larvae of aquatic insects, which they suck to death, as they faithfully only on their backs, and the small portion of blood the vital parts of some particular kind with affection. The leech swims in the manner of the eel, and some of the species live in salt waters, though the greater number are confined entirely to the fresh waters, some preferring the clear and pure element, and others the flagrant pools and ditches, ponds, and marshes which most abound with aquatic plants. There is only one species (the common kind), that can be applied with safety to medicinal purposes.

Species.

Inhabits flagrant ponds and ditches in Europe; the body is compos'd above of numerous annular wrinkles, which are constrictible at pleasure, and marked with variegated lines; mouth smaller than the tail; the left component of an annular muscle, by which it has the power of fastening its body firmly to any smooth surface. The medicinal virtues of this species as a phlebotomist is well known.

Abundant in flagrant waters; the length from four to six inches; the body above dull olive black or brown; beneath paler, with sometimes a few black spots, and tail thicker than the head. Sucks blood with great avidity and in large quantities.

LINEATA. Elongated and grey, with four dorsal lines disposed longitudinally. Müll.

A rare species, found early in the spring in flagrant waters; the length about an inch and a half; body annulated with numerous wrinkles, and six deep black eyes placed in a double row.

VULGARIS. Elongated, yellow-brown, with eight eyes disposed in a lunate series. Müll. Hirudo ovalata, Bergm. &c.

Length fifteen lines, the body sometimes brown, and without spots; sometimes sprinkled above with yellow dots, or with dots of black, or varied in the middle with a knotty line, and a lateral blackish one; and sometimes yellowish with longitudinal lineations, the middle knotty, and the lateral ones with remote red dots; eyes eight in general, or sometimes nine.

STAGNALIN. Elongated, cinereous, with two eyes. Hirudo stagnalis. Linn. Hirudo bicaudata, Müll.

Body whitish, pellucid, sprinkled with cinereous dots and placed at the sides; eggs about forty, surrounded by a pellucid circle. The young, after exuvium, adhere by their tails to the abdomen of the parent. Length nine lines.

COMPLANATA. Body dilated, cinereous, with a double tuberculated line on the back; the margin serrated. Müll. Hirudo lateralis attenuatus, Hill. Hirudo fuscaulata. Bergm.

Length four lines, the body with transverse bands, composed of three pale lines, the margin whitish; body beneath grey; head pointed and white, with six eyes; tail orbicular and cinereous. Found in shallow streams.

HETEROCYTA. Dilated, pellucid and yellow, with entire margin. Hirudo heterocyta byalina pollice lutea. Linn. Hirudo byalina, Müll.

Body
Dory flatfish, the anterior part pointed, posterior rather broad, and marked above with numerous fine longitudinal flarks of black specks, and remote brownish ones; head white, eyes four or six; eggs numerous, spherical, green and surrounded with a peuccid ring; the young that escape first are yellow, the latter green.

Inhabits fresh waters, and fixes itself to the bodies of fishes; eyes four, colours varying.

Inhabits fresh waters, and fixes itself on the bodies of trout and other fish after the spawning season; length eight lines, its progressive motion like the movement of a compas in measuring; body tapering before, and very broad at the tail; eyes four; colour variable.

**Tessulata.** Cinereous with a tessellated margin; eyes eight, in a double longitudinal row. Müll.

Length eighteen lines; the body dilated and covered with black specks; above with orange and white spots; beneath grey, with two rounded white spots in the middle. Found in rivulets.

**Marginata.** Dilated, brown, with a tessellated margin, and four eyes. Müll.

Inhabits rivers, and resembles the last; the length ten lines; head obtuse before and narrowed behind, white, pellucid, and marked with two tranverse brown bands; abdomen reddish brown with very minute flarks meeting beneath in double brown lines; back with five rows of whitish dots, the lateral margin white, with a double brown line divided into square patches; tail orbicular and pale, with brown spots on the margin.

**Grosa.** Dilated, yellowish, and divided on the forepart. Müll.

A marine species found sometimes within the shell of *Venus exoleti*; the length about twelve lines, the breadth seven. The body marked with fine white flarks, the anterior part narrow and obtuse; eggs very numerous, spherical, and swimming in a gelatinous fluid.

**Hipposliss.** Dilated, whitish, with a double white eye in the middle of the body. Müll.

Inhabits the sea and infects fishes, being often fixed to the skin of the turbot and holibuts. The body is oval, depressed, pellucid, a little pointed before, and ending in a placular ring behind; head somewhat triangular with a cinereous spot each side; eyes not visible; tail with a row of tubercles beneath the centre, and towards the middle two hooks.

**Muricata.** Body round, tapering, tuberculated, and furnished with two short horns on the head. Gmel.

A marine species that infects fishes, leaving a black mark on the spot to which it adheres; the head is larger than the tail; body strongly annulated and tuberculated on the rings; the tail much dilated.

**Crenata.** Slightly depressed, sub-oval, with transverse annular flarks, and crenulated margin. Linn. Trans.

Found in shallow streams among aquatic plants. The colour greenish, inclining to ash, the upper surface somewhat convex; its intercanina are very visible by means of its vitreous transparency, and appear like fo many granula; eyes two and much approximated.

It appears to us not altogether improbable, that among the numbers of species above described, some few at least will be hereafter found to belong rather to the genus Planaria, than that of Hirudo.

In the first volume of the Linnean Transactions Dr. Shaw describes an animal of the mollusca family, under the title of *hurudo viridis*, and which, from a note annexed to another paper, in the same volume of the same work, that afterwadors confidered referable to the planaria tribe. The correction of this is material, as some writers, depending on the former authority, still retain it among the huruids. In the removal of this species to the genus planaria, it will be proper to change the trivial appellation by which it was before distinguished, because another species of planaria, very different from the animal described by Dr. Shaw, has been previously designated by the appellation of *viridis*.

The two kinds of vermes introduced to notice by the Rev. Mr. Kirby, in the second volume of the Linnean Transactions, under the names of *hurudo alba*, and *hurudo fusca*, are, perhaps, planaria likewise; nor are we entirely satisfied that the species *crenata*, of the same author, and which is also described in the same paper, is strictly the hurudo tribe. Mr. Kirby himself suggests the idea, that they may be sufficiently distinct to constitute a new genus. Though we agree with Mr. Kirby in this respect, and are inclined with Dr. Shaw to think, they may with propriety be referred to the planaria genus, we cannot so far assent to the opinion of Dr. Shaw, expressed in the note (p. 322.) as to believe the *H. crenata* to be the young of the Linnean hurudo geometra. This last is delineated in all its stages of growth by Roefel under the title of *hurudo pseuoun*; and the slightest comparison of these figures, with those of hurudo crenata in the Linnean Transactions, will be sufficient, we imagine, to discourage such conjecture. There is one distinction, at once so obvious, that we cannot refrain to mention it; this consists in the number of the eyes in the two animals, the hurudo geometra possessing no less than four, and the species crenata no more than two.

We shall finally direct our attention to the *hurudo trancliata* of the Linnean Transactions, (vol. i.) a species of vermes, which is not, we believe, confounded with any absolute certainty to the genus at present under consideration; in this respect, at least, it is confessedly ambiguous, and as such, appears to have excited some little curiosity in the minds of continental naturalists. The observations of Bosc, on this particular subject, appear to us rather interesting and worthy of being transcribed, and this, the more especially, since they do not seem to place the account of this singular animal, as originally given by its English observer, in that clear and satisfactory point of view we could with far, or expect.

"On trouve (fays M. Bosc) dans le premier volume des *A textes de la Societé Linnéenne de Londres, la description et la figure d'une angue trouvé sur la terre de mer; qui a un corps formé de cote duées braches et terminées fort fin, il est évident que l'on doit en former un genre nouveau, fort tout si ce font réellement des branches; mais Muntz, l'auteur de ce mémoire, n'entre pas dans des détails sufisants pour pouvoir l'affirmer d'une manière positive." We admit with M. Bosc, that the ingenious writer, to whom we are indebted for the discovery of this curious creature, does not enter so fully into detail as to enable us to ascertain the genus to which it may belong, or rather, we might say, to authorize its removal into any other genus, were we disposed to consider its present situation improper. The conclusion of Bosc, that it does not pertain to the hurudo genus, is perhaps too incautiously alluded: the animal, he tells us, has several branches on each side, and it is upon the supposed excellence of these, that he reasons on the propriety of its forming a new genus, though he himself, at the same time,
time, doubts whether the lateral appendages to which he alludes be "branches" or not. The existence of such branches would unquestionably be sufficiently decisive to remove it from the hirundo tribe, since the latter respire by the mouth, but as to the actual existence of such branchings it is possible we may misconceive the fact; or indeed the ramose appendages to which he advert centres may be确实 such, for there is nothing, at least, in the description given by Mr. Menzies, either to support or contradict this idea.

The description of this creature, as given by Mr. Menzies, is briefly as follows: H. depressa, attenuata, albida, letis lateralibus ramosis utrinque 7; interaneis fusces, bidiod, per- lucentibus &c., as may be rendered to the English reader: deprived, attenuated, white, with seven ramose bristles each side; internes brown, bidid, and pullicid; and in the general account accompanying this specific description, these lateral appendages are said to be soft, pullicid, branchy bristles.

Thus it is not apparent, from any observation that has fallen from Mr. Menzies, that these lateral appendages are real branchies, or respiratory organs: having hatted this, it is fair to add, that the conclusion of Bofe, though not to be assumed from the remarks of its original describer, may be nevertheless accurate, and probably is so. The appearance of the animal, if any confidence can be placed in the delineation, seems to favour this conception. The magnified figure of one of these lateral ramose appendages, as shown in the plate in particular, accords exceedingly in appearance with the breathing organs of some of the mollufca tribe, as exemplified in various species of the cercides, aphrodisia, and others; and should the animal really possess such breathing organs, its internal organization must be altogether so very different from that of the hirundines, that there can be no doubt of the propriety of instituting a new genus for its reception.

HIRVENSLÉM, in Geography, a town of Sweden, in Tavalland; 75 miles E. of Tavallhus.

HIRUNDO, in Ornithology, a genus of the Passerine order, distinguished by the following essential character. The hill is small, weak, curved, frilluted, and depressed at the base; gape larger than the head; tongue short, broad, and bisid; wings long; tail mostly forked.

This genus is divided by some writers into two sections, according to the position of the feet, the first having three toes placed forwards and one behind; the other with all the toes placed forwards; the former are the swallows, the other the <i>famly</i> of English authors. In both the nostrils are open, and the legs short.

Most of these birds frequent marshy places, and skim the surface of the ground and water in search of insects, which they catch on the wing with great dexterity, by means of the enormous gape of their jaws. Insects are their peculiar and almost exclusive food, and it is for this reason swallows are regarded with a degree of superlative tenderness in every country that abounds with noxious creatures of that description. Swallows are equally incapable of bearing the extremes of heat and cold, and on that account, except in very temperate weather, they are often seen on the wing in the morning before the heat of the day becomes oppressive, and in the evenings towards sunset than at any other times.

These birds walk indifferently owing to the shortness of their legs, and from the same cause rise off the ground, or any low situation with difficulty; and hence when they go to rest, they alight invariably suspend themselves against the sides of walls or other elevations, from which they are enabled to renew their aerial evolutions with facility.

The annual migration of the swallow has been long the theme of curious observation among naturalists, and few topics of this kind have met with more ample discussion, or given birth to more extraordinary opinions. The truth, however, is, that the migrations of the swallows, like those of most other birds of passage, may be easily explained, since nature does not in this instance, more than any other, deviate from her ordinary course, and of this we have the most positive assurances both in reason and in fact. Nearly all the species of the swallow tribe are found in the two great continents, remaining in the northern part during summer, appearing near the equinox in spring, and again retiring to more temperate climates as the autumn approaches. Part remain in hot countries all the year, as in Egypt, Ethiopia, Libya, and the countries between the tropics. They regularly pass alternately across the Archipelago from Europe to Africa, and from Africa to Europe as the seasons change; this is the general progress of all the species of the swallow tribe that inhabit Europe; and the same course of migration from one part of the world to another is observable in the common swallow, the species whose migrations have excited such very peculiar attention among modern writers as well as those of remote antiquity; we shall enter more fully into the details of this interesting subject under the article SWALLOW.

The hirundo genus, including the swallow and the swift family, contains about forty species, the greater part of which are swallows, the swifts being few in number.

Species.

The common swallow is an inhabitant of most parts of the globe, being of the migratory kind, and visiting different countries at particular seasons. About the latter end of March it arrives in England, and remains till September, during which intervening period it frequents houses, under the roofs, or in the chimneys of which it usually breeds; the nest is composed of mud, intermixed with chaff, feathers, &c. and contains from four to six eggs of a whitish colour speckled with red. Previously to its departure it assembles in vast flocks on the tops of houses, churches, or other elevations, from whence they all depart in a body with extreme regularity, and as it appears under the directions of particular leaders. Thos. from Europe pass the winter in Africa, South America, India, and other similar climates, returning again towards the north in spring. Like the rest of its tribe the food of the swallow consists of insects, which it takes on the wing. This hirundo (faya an ingenious writer) though called the chimney-swallow, by no means builds altogether in chimneys, but often within barns and out-houses against the rafters. In Sweden they builds in barns, and is called ladu swall, (the barn swallow.) Besides, in the warmer parts of Europe there are no chimneys to houses; and in these countries the constructs her nest in porches, gateways, galleries, and open halls. With us the species breeds in chimneys, and loves to haunt those flocks where a continual fire is kept, no doubt for the sake of the warmth. But then it cannot subsist in the thrust at the bottom of which the fire is burning; it prefers one adjoining, in which it builds its nest about five or six feet below the chimney opening at the top. The nest is constructed of mud mixed with short pieces of straw, in the form of the half of a deep dish, and is lined with feathers and grass, which it catches floating in the air. The address with which
the swallow ascends and descends with security through a narrow pass is wonderful. When hovering over the mouth of the funnel, the vibration of her wings, acting on the confined air, occasion a rumbling noise like thunder. It is not improbable that the dam submits to this inconvenient situation so low in the shaft, in order to secure her brood from rapacious birds, and particularly owls, which frequently fall down chimneys, perhaps in attempting to get at the nestlings. The first brood of young are hatched the last week in June, or the first week in July. The progressive method by which the young are introduced into life is very amusing; first they emerge from the shaft with difficulty enough, and often fall down into the room below; for a day or two they are fed on the chimney top, and then are conducted to the dead leaves bough of some tree, where, fitting in a row, they are attended with great affability, and may then be called porchers. In a day or two more they become flyers, but are still unable to take their own food, therefore they play about near the place where the dams are hawking for flies, and when a mouthful is collected, at a certain signal given, the dam and the nestlings rise up towards each other, and meeting at an angle, the young one all the while uttering a quick note of gratitude and complacency. All the summer long is the swallow a most inoffensive pattern of unwarried industry and affecion, for from morning to night while there is a family to be supported the parents spend the whole day in skimming close to the ground, and in the most sudden and lively evolutions. Avenues and long walks under hedges, and pasture fields, and bow meadows where cattle graze, are her delight, especially if there are trees interspersed; because in such places insects abound. The swallow is the first to announce the approach of birds of prey to the house martin and other little birds, warning them of danger by its thrill alarming note, and associating them in a body to pursue and buffet the intruder. The swallows drink as they fly lifting the surface of the water, and in hot weather are often seen dropping into the water many times together, to wash and cool themselves. The song of this bird is very pleasing.

The swallow, though generally regarded in most countries with a kind of superstitious veneration for its utility in destroying pernicious insects, is in Italy and some other parts esteemed a bird of chase, and the hunting of them at particular seasons a favourite diversion. The nests is considered as a delicacy little inferior to that of the ortolan.

The efculent swallow is said to be less than the wren, and only two inches and a quarter in length; the bill black; irides yellow; upper part of the body brown; the under whitish; tail forked, with each of the feathers white at the tip; and the legs brown. This description was taken by Briffon from a drawing of the bird by Mr. Poivre, the figure of which is repeated in the ornithology of Briffon. Mr. Marsden, however, describes the bird to be about the size of the common martin, and Dr. Latham, when he published his Synopsis, was inclined to think the bird at least of that size; this he was induced to believe from the size of the eggs which accompany the nest of the efculent swallow, now in the British Museum, and which are as large as those of the martin, and of the same colour.

The nests of these birds, in shape resembling a lemon cut down the middle, and composed of gelatinous substances about the species worth of particular curiosity; the nest itself being not only edible, but considered as one of the greatest delicacies of the table by the luxurious Asiatics. This nest, the weight of which is about half an ounce, adheres by one side to the rock. Authors differ greatly as to the materials of which it is composed; Obeck and others imagine it to consist of sea-worms of the mollusca order: Forrester conceives it to be the sea-qualm, a sort of cuttle-fish found in those seas, or a glutinous sea-plant, called agal-agal. Or it has been again supposed they rob other birds of their eggs, and apply the white of them to that purpose. The fabrication of these nests is very obvious, being composed of several concentric layers, which are seen distinctly when the nest is broken transversely. These nests are found in vast numbers in certain caverns in the various islands of the Sololo Archipelago, situated between the longitude 117° and 120°, and latitude 5° and 7°; particularly in three small islands, or rather rocks, in the caverns of which the nests are found fixed to the sides instead of numbering them. They are also found in amazing quantities on a small island called Toc, in the straits of Sund; the caverns of which are lined with the nests; but no where in greater abundance than about Croee, near the south end of Sumatra, four miles up a river of that name. But they are not peculiar to the above places; for they are likewise common from Java to Cochinchina on the north, and from the point of Sumatra west to New Guinea on the east; where the sea is said to be covered with a viscous substance, like half-melted glue, and which some suppose the birds either take up from the surface by means of the bill during flight, or pick up from the rocks when left there by the waves.

The nests are of two colours, the one whitish, the other black, and apparently dirty. The whitish kind is perfectly clear, and is applied to the purposes of thickening broths, and ragoons made of chickens, and to which they contribute, it is said, an exquisite flavour. These nests are first soaked in water to soften, are then pulped to pieces, and, after being mixed with ginseng, are put into the body of the fowl. The whole is then fluxed in a pot with a sufficient quantity of water, over a fire of coals all night, and the morning following it is fit to be eaten. The black nests are of a pure yellowish white, and half transparent, and these fell in China from one thousand to fifteen hundred dollars the pekul, a weight equal to about 12lbs. English. Thoese of a black colour being dirty, are worth but about twenty dollars the pekul, being serviceable only in making glue. The gatherers take all they can, in the hopes of compelling the birds to make fresh nests, and thus render their next gathering more profitable. The Dutch alone are paid, a few years ago, to export from Batavia a thousand peckuls of these nests every year, the whole of which are brought from the islands of Cochinchina, and those lying to the eastward. At Sumatra the bird is known by the name of layang-layang.

The above-mentioned nests, (examples of which occur pretty frequently in the cabinets of the curious,) are supposed to belong to the bird described by Briffon, but of this we are not entirely assure: it was before observed, that the bird described by Marsden was far superior in size to that mentioned by Briffon, and from the recent observations of writers, it does really appear these nests may be the fabrications of some other bird with which we are at present unacquainted. The idea entertained by Sir George Staunton, (Emb. China) seems to be that these nests may be the produce
HIRUNDO.

The species laid Hirondelle, Gmel., too legs transferred to the bill below, the Hirundo bill beneath bill cap variety IVheat bill bill power; Donov. ventre the front bill beneath quill-feathers. 

The female lays four or five eggs, which are tusked.

Inhabits sandy places in Europe and America; the length four inches and threequarters; bill blackish; legs blackish, and feathered behind. The female lays from five to fix eggs, of a clear white colour, either in a nest, which it builds of dried straws, straw, and feathers; or in hollows of trees, or cavities in the said, and sometimes in the steep flues of lakes and rivers.

RUPERTIS. Monfe-colour, beneath whitish; tail female, the feathers with a white spot on the inner web. Scop. Rock swallow.

Makes its nest of clay in the hollows of rocks, and inhabits Carniola. Size of the common martin.

MONTANA. Monfe colour, beneath rufous; quill and tail-feathers grey brown, edged with rufous, the latter, except the middle and outer ones, with a white spot within. Gmel. Hirondelle gris des ruchers, Buff. Craig swallow, Lath. Mountain swallow.

Inhabits the mountains of Savoy and Dauphiny, and also those of Savoy, arriving at the latter about the middle of April, and departing in the middle of August. The length is five inches and a half; the bill black; legs covered with grey down and mixed with brown, claws black.

Length seven inches and threequarters; bill black; legs and claws blackish; the plumage of the male richly glossed with purple, that of the female dusky brown. The species passes the summer in Carolina and Virginia, retiring to warmer climates at the approach of winter.

Rather larger than the swallow; bill black; quilts, and forked tail blackish edged.

Length eight inches and a half; the bill black and dusky; rufous on the throat, and under the wings pale. Native of Sénégal.

Size of a wren; the length five inches and a half; bill half an inch long and black; tail very forked; the legs black. According to Seba the species is said to emit a powerful foment, resembling that of ambergris. The species inhabits Sénégal. There is a variety of this species, the plumage of which is pale ash, beneath paler.

FACIATA. Black; transverse band on the belly and spot on the outer part of the thighs white. Gmel. Hirondelle à cinglure blanche, Buff. White-billed swallow, Lath.

Inhabits
HIRUNDO.

Inhabits near rivers in Cayenne and Guiana: the length six inches.

Length five inches and three quarters; the bill black; throat and breast grey brown; quill and tail-feathers blackish brown; tail slightly forked; legs brown. Briffon describes the species as a native of Brazil and Cayenne, and Sloane as an inhabitant of Jamaica, being a bird of passage, and remaining on the island six months of the year.

TURQUATA. Brown, beneath white; tail even; pectoral band brown; between the bill and eyes a white spot. Gmel. Hirondelle brune et blanche à côte brune, Buff. Brown collared swallow.

Native of the Cape of Good Hope. Length eight inches.

Length four inches and a half to five inches; the bill black; wings longer than the tail; quill and tail-feathers brown, gloved with blue and green; the legs pale. A variety of this species is also found, the plumage of which is brown above, beneath spotted with brown. "These birds inhabit the marshes of Savannah.

There are two distinct varieties of this species, in one of which the throat is whitish and spotted with rufous, in the other the rump is grey, and the throat grey tinged with rufous. The first inhabits Carolina and Virginia, the other Louisiana; the common occurs in Cayenne. The length is four inches and a quarter, and it builds in chimneys like the common swallow.

ACUTA. Black, beneath brown; tail-feathers naked, and subulate at the tip. Gmel. Hirundelle noire à côte de la Martinique, Buff. Acute tailled swallow.

A small bird not exceeding the size of the common wren. This species is found in Martinique.

Native of the islands in the Pacific ocean.

CAUDACUTA. Blackish; front white; wing-coverts varied with white; caudal feathers pointed at the end. Hirundo caudata, Lath. L'Hirondelle acutipennis de la Nouvelle Galles, Viel. Sharp-tailed New Holland swallow.

Inhabits New Holland. Size twice that of Hirundo acuta.

Inhabits the Alpine parts of Siberia, and builds an hemispherical nest in the clefts of the highest rocks. Its size exceeds that of the common swallow; the temples are ferruginous; primary quill feathers blackish, the tips obtuse with a brown tinge; the first long, outer tail-feather twice the length of the rest; vent pale-ash, the feathers black at the tip.

ERYTHROCEPHALA. Dusky black, the feathers edged with white; beneath white; the head red. Gmel. Rubicunda headed swallow, Lath.

Size of the leaf hummer bird. Inhabits India.

AONALASIKENSIIS. Black; beneath cinerous; rump whitish. Lath. Aonala sikakensis.

Inhabits Aonala sikakensis. Length four inches and a half.

INDICA. Purple, beneath whitish; greater part of the head rufous. Gmel. Rufus-headed swallow, Lath.

Native of India. The length is four inches; some of the wing-coverts edged with white; quill-feathers longer than the tail; bill dusky brown; legs dusky.

The length of this bird is near six inches; the bill black and half an inch long; the tail is forked; and the wings longer by nearly an inch and a half. This species inhabits dry places in the interior of South America, and is not numerous. For the reception of its nest it digs a deep hole in the earth, about half a foot in length, with a long entrance rising to the surface, the opening of which is so very small as only just to permit its entrance. Buffon describes two varieties of this bird, one of which has a white stripe in front, and the other entirely blackish grey.

Size of the chimney swallow; the bill and legs brown. This species inhabits the West Indian islands during the months of May, June, and July. Its song resembles that of the lark.

Native of Peru. The eyes black, surrounded by a brown circle.

Lefth than the common swallow, and inhabits Peru and Otaheite. A supposed variety entirely blackish-grey, with the wings longer than the tail, is found in Louisiana.

A constant inhabitant of Cayenne throughout the year, and is frequently seen perched on fallen or decayed trees, in the hollows of which it lays its eggs, without the trouble of compounding a nest. The length of the bird is six inches; the bill three quarters of an inch long, rather stout, and with the legs brown.

VIOLACEA. Black-blue tinged with violet; greater quill-feathers within, the bill and legs blackish. Gmel. Hirundus bleu de la Louisiana, Buff. Violet swallow.

Length eight inches and a half; bill three quarters of an inch and black; the legs black. Inhabitats Louisiana.

JAVANICA. Bluish-black; front, throat, and fore part of the neck, ferruginous; beneath and rump ash; tail black, the feathers, except the two middle ones, with a white spot on each side. Hirundo javanica, Sparrman, &c. Java swallow.

About the size of the chimney swallow; the bill and legs black. Inhabitants Java.

BICOLOR. Black glossed with blue; front,fore part of the neck, and flank, red-brown; throat fawn colour. L'Hirondelle noire et fauve, Sonnini.

Native of America; size of the chimney swallow, and rather longer; the wings and tail edged with greyish-white; the breast grey-brown; middle of the belly and the under coverts
coverts of the tail whitish; tail forked; bill and legs black. The male birds vary in the colour of the plumage, beneath being more or less whitish, tawny or reddish. The colours of the female are more obscure.

**Cerulea.** Blue, glossed with violet, green, and coppery; front, cheeks, throat, and under parts of the neck, reddish; tail with a crescentic-formed band of white. *L'Hirondelle bleue et roufpe,* Sonnini.

A new species lately found in Giana; the length six inches and a half; the bill half an inch; between the neck and breast a blue collar.

**Toes all placed forwards. Swift.**

The male of this well known species is about eight inches long, the female rather less; the whole plumage of the former footy black, except the chin, that of the female more inclining to brown, and the spot on the chin obscure. The swift, from its length of wing, flies well, but its feet are so small that it rifes from the ground with great difficulty; its walking also is attended with inconvenience from the same cause, and it rolls chiefly by clinging to the sides of walls, and other similar situations. It builds under the eaves of houses, or in treetops, towers, and other lofty buildings; and generally lays five eggs, the colour of which is white, and the form somewhat elongated. The food of these birds consists of insects. They are inhabitants chiefly of the European continent, though sometimes noticed in America. This is the only kind of swift found in Britain.

Length eight inches and a half; the bill black; collar grey-brown varied with blackish; wings and tail glossed with red and green; breast white; lower part of the belly grey-brown; legs flesh-colour, and downy in front. Inhabits the mountainous parts of Spain, and other countries in the south of Europe. It flies higher than the common swift, and, like that species, feeds on insects.

**Cayennensis.** Blackish-violet; head black; collar two-cleft, band of the eyes, and the thighs white. Gmel. *Martinet à collier blanc,* Buff. *White collared swift.*

Native of Cayenne, where it builds its nest in housetops. The nest is large, long, and conic, the greatest breadth five inches, and the length nine inches; it is composed of down well woven together, and the cavity divided obliquely down the middle by a partition which extends over that part of the nest in which the eggs are disposed. The length of this bird is five inches and a quarter.

**Senvensis.** Brown, beneath reddish grey; crown pale fuscous; eye-brows brown; chin and eye-lids white. Gmel. *Grand martinet de la Chine,* Sonner. *Chinese swift.*

Inhabits China; length eleven inches and a half; bill, irides, and legs blue-grey.

**Hirzelhollen, or Hertsholm, in Geography, three small islands of Denmark, lying in the Cattegat, chiefly inhabited by fishermen; 4 miles N.E. of Fladdam. N. lat. 57° 31'. E. long. 10° 24'.**

**Hischarduman, or Illyricum, a town of Great Bucavus; 60 miles N.N.E. of Balk.**

**Hischer, two small islands among the Hebrides. N. lat. 57° 37'. W. long 7° 40'.**

**Hisholt, a town of Sweden, in the province of Smaland; 20 miles S.E. of HELSINcf.**

**Hisingen, a small island in the North sea, situated near the coast of Sweden, at the mouth of the Gota, about 16 miles long and six broad, containing seven parishes. The town of Gothborg was first built on this island. N. lat. 57° 45'. E. long. 11° 48'.**

**Hism, a town of Albania, at the mouth of a river; 16 miles N.N.E. of Durazzo.**

**Hispa, in Entomology, a genus of Coleoptera in the Limnanthaceae, having the antennæ cylindrical, approximate at the base, and feated between the eyes; feelers filiform, thorax and wing-cases often spinous, and usually toothed at the apex.**

The four species of the hispa tribe, known to Linnaeus, were atara, telmca, fangnemis, and mutica, the latter of which was not however then considered as appertaining to that genus, being referred by Linnaeus to the dermellea family, under the specific name of clavicorpus. Geoffroy describes the species atara as a native of France, and this he places with his *criceere,* the genus formed by that writer of the oblong chrysemele; but from which, on close inspection, the true hispa will be found to differ rather considerably in the structure of the antennæ, and some other less essential particulars. No material progress was made in the knowledge of the species composing the hispa genus till the time of Fabricius, that writer having described and brought together in one view, from the cabinets of Rohr, Bofe, Paykull, and Hunter, no less than 12 species, including the four already mentioned. In the first instance Fabricius included more, several new kinds being united by him with the true hispa, which, on mature deliberation, he conceived it proper to separate, and divide into two new genera; and thus it happens, that the *Plinius* and *Melas* of his last works are hispas of the former. This observation will serve to explain, in an obvious manner, the cause of that discordance which prevails between the works last noticed, and the Gmelian edition of the Systema Naturae: the latter containing, under the genus hispa, a further number of Fabrician species, than the "Entomologie Systematica" of that author, or any of his later works, in which Plinius and Melas are considered separately. Thunberg has added some new species to the hispa tribe, and these augmentations have increased the number to nearly twenty species.

The genuine hispa, according to Fabricius, have cylindrical antennæ; feelers equal, filiform, and thicker in the middle; jaws short, and thick, and the lip membranous and toothed. In *Melas* the antennæ are filiform, as in *Plinius,* but the feelers (four in number) are elevated, with the extreme joint ovate, and the lip membranous and entire.

Most of the hispa genus are natives of extra European climates; those found in Europe occur in the winged state on the leaves and roots of different kinds of grasses; their larvae and transformations are unknown.

**Species.**

**Atra.** Antennea filiform; thorax and wing-cases spinous. Linn. *Chionis tuta aura,* Geoff.

Found at the roots of grasses in Europe.

**Tetraex.** Antennea filiform; body tesselate; antennæ and eyes black. Linn.

An African species; spines on the thorax lateral, on the wing-cases scattered, the whole black.

**L 2**

**Bipustulata.**
Bisustulata. Antennae ferrated; body hairy, and black; wing-cases with a rufous spot at the base. Fabr.

Native of Italy.

Medita. Antennae hairy; body black; wing-cases ferrated. Linnaeus.

Inhabits Europe.

Saxonicollis. Antennae fusiform; thorax and base of the wing-cases fuscous; wing-cases ferrated. Linnaeus.

An American species: wing-cases ferrated at the tip with three elevated frings, and the intermediate spaces punctured.

Seribata. Antennae fusiform; body black; wing-cases pale rufous, ferrated and black at the tip. Fabr.

Native of Surinam; thorax black with rufous sides; wingcases ferrated.

Dentata. Antennae fusiform; body black; margin of the thorax yellow; wing-cases ferrated, with a yellow spot at the base, and a band in the middle. Fabr.

Head, with the antennae black; thorax black except the sides; breast and base of the abdomen yellow. Inhabits Cayenne.

Angulata. Antennae fusiform; body yellow; head, dorsal line on the thorax, and sinuate margin of the wing-cases black. Fabr.

Native of Cayenne. Head and antennae black; wing-cases grooved, truncated, and toothed at the tip; body beneath ferruginosus.

Emarginata. Antennae fusiform; body black; wing-cases with a rufous spot at the base, the tip bidentated. Fabr.

Size of the preceding; head rufous; eyes globular, and with the antennae black; wing-cases with three raised lines, transferably grooved; body beneath pubescent; legs black; thighs pale at the base. Inhabits Surinam.

Serraticornis. Antennae ferrated, and compressed at the base; body black; margin of the thorax, and spot at the base of the wing-cases yellow. Fabr.

Inhabit Surinam, and resembles the last. The head is whitish; crown black; wing-cases grooved, with a single raised line in the middle, and three-toothed at the tip, the middle tooth larger, rounded, and ferrated; breast and base of the thighs white.

Bidens. Ferruginosus; thorax with a black lateral line; tip of each wing-case armed with a single tooth. Fabr.

Size of the last; head ferruginosus; eyes black; wingcases grooved with a double row of dots between each furrow. Native of Surinam.

Nigricornis. Glabrous and scarlet; antennae black. Fabr.

Native of the Cape of Good Hope.

Bihamata. Unarmed, black, dotted with red; wing-cases truncated and hooked. Gmel.

Oblong, depressed, and inhabits India.

Cornuta. Entirely black; anterior and posterior part of the thorax spinous; wing-cases with longitudinal raised lines. Thumb.

Inhabits Sweden.

Capensis. Pitchy and hispid; thorax with a palmed spine. Thumb.

Found at the Cape of Good Hope.

Scabera. Entirely black; thorax and wing-cases with a ferrated fringe at the edge. Thumb.

Inhabits Sweden.

Serratula. Brown; antennae ferrated; wing-cases ferrated. Thumb.

Inhabits Upfäl.

Ibis. Antennae ferrated; body hairy, and black; wing-cases with a rufous spot at the base. Fabr.

Native of Italy.

Metica. Antennae hairy; body black; wing-cases ferrated. Linnaeus.

Inhabits Europe.

Saxonicollis. Antennae fusiform; thorax and base of the wing-cases fuscous; wing-cases ferrated. Linnaeus.

An American species: wing-cases ferrated at the tip with three elevated fringes, and the intermediate spaces punctured.

Seribata. Antennae fusiform; body black; wing-cases pale rufous, ferrated and black at the tip. Fabr.

Native of Surinam; thorax black with rufous sides; wingcases ferrated.

Dentata. Antennae fusiform; body black; margin of the thorax yellow; wing-cases ferrated, with a yellow spot at the base, and a band in the middle. Fabr.

Head, with the antennae black; thorax black except the sides; breast and base of the abdomen yellow. Inhabits Cayenne.

Angulata. Antennae fusiform; body yellow; head, dorsal line on the thorax, and sinuate margin of the wing-cases black. Fabr.

Native of Cayenne. Head and antennae black; wing-cases grooved, truncated, and toothed at the tip; body beneath ferruginosus.

Emarginata. Antennae fusiform; body black; wing-cases with a rufous spot at the base, the tip bidentated. Fabr.

Size of the preceding; head rufous; eyes globular, and with the antennae black; wing-cases with three raised lines, transferably grooved; body beneath pubescent; legs black; thighs pale at the base. Inhabits Surinam.

Serraticornis. Antennae ferrated, and compressed at the base; body black; margin of the thorax, and spot at the base of the wing-cases yellow. Fabr.

Inhabit Surinam, and resembles the last. The head is whitish; crown black; wing-cases grooved, with a single raised line in the middle, and three-toothed at the tip, the middle tooth larger, rounded, and ferrated; breast and base of the thighs white.

Bidens. Ferruginosus; thorax with a black lateral line; tip of each wing-case armed with a single tooth. Fabr.

Size of the last; head ferruginosus; eyes black; wingcases grooved with a double row of dots between each furrow. Native of Surinam.

Nigricornis. Glabrous and scarlet; antennae black. Fabr.

Native of the Cape of Good Hope.

Bihamata. Unarmed, black, dotted with red; wing-cases truncated and hooked. Gmel.

Oblong, depressed, and inhabits India.

Cornuta. Entirely black; anterior and posterior part of the thorax spinous; wing-cases with longitudinal raised lines. Thumb.

Inhabits Sweden.

Capensis. Pitchy and hispid; thorax with a palmed spine. Thumb.

Found at the Cape of Good Hope.

Scabera. Entirely black; thorax and wing-cases with a ferrated fringe at the edge. Thumb.

Inhabits Sweden.

Serratula. Brown; antennae ferrated; wing-cases ferrated. Thumb.

Inhabits Upfäl.

Hispalis, Seville, in Ancient Geography, a town of Hispafia, or the Boetis, which was one of the most consider-
after the conclusion of the second Punic war. In the beginning of the Macedonian war, the two provinces were united; but they were again separated in the confutate of Q. Publius Petrus and M. Junius Pennus. This last distribution of Spain continued till the reign of Augustus, who divided Hispania Ulterior into the two provinces of Bética and Lusitania, and affixed the name of Provincia Tarraconensis to Hispania Citerior. This latter province, so called from its principal city, comprehended nearly three-fourths of modern Spain, and was separated from Bética and Lusitania by an imaginary line supposed to extend from the gulf of Carthagena to the confluence of the Agueda and Douro, on the confines of Portugal. Bética, so called from the river Bétis, was a small province along the coast, on either side of the Euxum Herculeum, from the gulf of Carthagena to the mouth of the Anas; and, in general, included the provinces now called Granada and Andalucía. The division, introduced by Augustus, remained as long as the Romans had any power in Spain. (See BÉTICA, LUSITANÍA, and TARRACONÉS.) The most noted rivers in Hispania were the Minus or Minho, Lethe or Lima, Durios or Douro, Tagus or Taño, Ares or Guadiana, Bétis or Tartessus or Guadalquivir, Sigüia or Xemil, Terebus or Tader or Segura, Sucro or Xacar, Iberus or Elbo, Securis or Segre, Rubicatus or Lobregat, Sambroca or Ter; and its principal bays were the Sueccenos flins or bay of Valencia, Illitetamflins or bay of Alican, Virgitianus flins or gulf of Carthagena, Caditanus flins or bay of Gibraltar, Magnus Portus or bay of Coruña, commonly called the Grove, and Cantabricus flins or bay of Biscay. Its chief mountains, capes and promontories, as well as towns, will appear under their proper heads, and under the title of SPAIN.

As to the history of Hispania, it is hardly necessary to observe, that the Spaniards trace their origin from Tubal, the fifth son of Japhet, who is said to have reigned in Spain from the year of the flood 1435 to 258; and that from him they pretend to give a farrv of monarchs down to three Genero, who were killed by the Egyptian Heracleus, and of some other invaders from Libya, as far as the time in which they allow the Celts to have made their first entrance into Spain, in the year of the flood 1350. According to this fabulous account, Spain had been a monarchy, and had lasted 1236 years before the arrival of the Lucetians, who, according to the present state of their history, would be placed about the year 209 before the arrival of the Celts. But dismissing these fables, we shall begin the history of Spain with the arrival of the Celts in this country, which is said to have taken place in the year 1649 B.C. These people crossed the Pyrenées, and after a contest with the Iberians, as the native Spaniards were called, formed an alliance with them, and by intermarriage they became one people, under the name of Celtiberians. After an interval of about 20 years, the Rhodians came hither by sea, and settling at the foot of the Pyrenean mountains, built a city, to which they gave their name; but which has long since been reduced to ruins. At this time the mines of Spain yielded great quantities of silver; accordingly Aristeides informs us, that the Phœnicians visited this country in the 9th century B.C. to exchange their naval commodities for this metal; and they are supposed to have settled in Bética and to have built several cities. Eusebius, in his Chronicon, lib Ann. ante Chr. 849, mentions several nations, besides Tyrians, Egyptians, and Phœnicians, who made settlements in Spain; such were the Mileteaus, Carthères or Carthians, Lusitani, and Phœnicians. Nebuchadnezzer also, after the destruction of Jerusalem and conquest of Judea, is said, by Jophelus and Strabo, to have reigned in Spain nine years; at the end of which period, it is affirmed, that he abandoned it to the Carthaginians. (See CARthagINIANs.) It is probable, however, that most, if not all, of these nations, contented themselves with maritime situations, for the advantage of commerce and the command of the sea; and that they penetrated but a little way into the country; while the natives might enjoy their own laws and government, and be glad to trade and barter with them, and feel little solicitude who were masters of the sea-coasts and parts adjacent, provided they could obtain the benefits of commerce with them, and enjoy the produce of their own lands, in peace and tranquility. The Carthaginians, after many fierce contesuls with the Romans, were dispossessed by the Scipios, and as soon as they became masters of this rich and producive country, or at least of a considerable part of it, they directed their chief attention to its valuable mines, particularly those of silver and gold; and it is said, that Scipio, upon his return to Rome, carried with him 14342 pounds of silver, besides an immense quantity of coin, cloths, corn, arms, and other valuable effects. L. Lentulus is said to have brought away 44,000 pounds of silver, and 2550 pounds of gold, besides the money which he distributed among his military followers. L. Manlius carried with him 1200 pounds of silver, and about 80 of gold. Corn. Lentulus, after having governed the Hither Spain two years, possessed himself of 1515 pounds of gold, and of silver 31520 denarius in coin, whilst his colleague brought from Further Spain 50,000 pounds of silver. It was this prodigious wealth, supplied by the country, which was still thought to be unexhausted, that invited the northern nations many centuries after, to make incursions, and to drive the Romans out of it. (See GOTHs and VANDALS.) Learning, and the liberal arts, if Strabo (lib. iii.) may be credited, began to flourish at an early period in this country; for he tells us, that the Tarde- tani, a people of Bética, were very celebrated in this respect, and were praised for a vast number of volumes of great antiquity, and codes of laws written in verse, and other pieces of poetry of very ancient date. Their language was most probably the old Celtic; but it underwent many changes by means of the different nations who subdued this country, and particularly by the influence of the Romans. Upon the irruption of the Goths and Vandals, it degenerated from its purity. It is evident, if we may depend upon the authority of Strabo, that the ancient Spaniards must have been the people who were before the Spaniards, or any others of Celtic extraction. From the settlement of the Romans, however, their letters, as well as language, extincted all the rest, and continued in use till their expulsion, when the old Gothic took place. In the educating of their youth, they took great pains to inspire them with a love of liberty, and a contempt of death. This country, by reason of its excellent situation for commerce, and the abundance of commodities, particularly silver, which it furnished, invited hither all the trading nations of Europe, Asia, and Africa; nor is there, perhaps, any kingdom, that ever paid more for so many different matters. Egyptians, Phœnicians, Tyrians, Carthaginians, Romans, Gauls, Germans, Goths, Vandals, Moors, and many others had their settlements in it, and thus promoted its trade and navigation, and founded in it great and opulent cities. With regard to the character of the ancient Spaniards, we may observe, that they possessed all the virtues of the old Celtic nation; and inherited fewer of their vices than any others of their descendants; they were brave, magnanimous, and hospitable to a high degree; and so famed for their fidelity, that even after being conquered by the Romans, several of these emperors preferred them to other nations, to be their body-guard. They were sober, frugal, and patient under hardships; jealous of their honour, and...
till a few centuries pall, rather deirous to preveire their own territories, than to feck new settlements abroad. See Spain.

**HISPANICUM VIRIDE**, *Spanifh green*, a name given by fome to verdigris.

**HISPANIOLA**, in Geography. See St. Domingo.

**HISPID LIAE**, among Botany. See Leaf.

**HISPID Stalk.** See Stalk.

**HISSAR**, in Geography, a cirar of Hindooftan, in the Soubah of Delhi, bounded on the N. by Sirhind, on the E. by Ballogiottin, on the S. by Nardeek, and on the W. by Moultan.

**HISSAR Forestry**, the capital of the above cirar, near the river Surfooty, which traverses the cirar from N. to S.; 75 miles W. of Delhi. N. lat. 28° 40'. E. long. 76° 4'. **HIPPING**, an appellation given by grammarians to the three confonants, *s*., *s*., and *z*.

**HISTER**, an Etrurian word which implied a flage-player, and during the perfellence at Rome, 364 years B.C. actors were fet for from Etruria, to try to appease the gods by public exhibitions; hence the Roman actors afterwards acquired the name of histriones. Livy, lib. vii cap. 2.

**Hister**, in Entomology, a genus of Coleoptera, the antenna of which are elevated, and the club fold, with the half joint compressed and decurved; head retractile within the body; mouth forcipated; wing-castes shorter than the body, and truncated; anterior tachs toothed; hind tachs fipuous. In the larve, as well as the adult, or winged flate, the infects of this family are frequently met with in the dung of horses, cows, and other animals.

**Species.**

**Major.** Black; wing-castes somewhat fiated; thorax eliuated at the edges. Linn.

Native of Africa, and differs only in size from the Linnean hister maximus. The hairs at the edges of the thorax ferruginous.

**Unicolor.** Black; wing-castes obliquely fiated. Linn.

Donov. Br. Inf.

Inhabits Europe and America.

**Glaibratus.** Black and polifhed; wing-castes somewhat fiated, punctured, and as long as the abdomen. Fabr.

Jaws advanced, arched, acute and armed with a tooth in the middle; antenna black; wing-castes retuse behind.

**Sempunctatus.** Black, polifhed, brayfly; wing-castes obliquely fiated at the base, and obfolutely punctured at the tip. Herbit.

Native of Barbary; head and thorax with a brayfly hue; all the tachs comprefled and ferrated. Found alfo by Paykull in Sweden; and by Marsham in Britain.

**Scaber.** Black, and fcarous, with falled dots. Fabr.

Inhabits Spain.

**Cyaneus.** Thorax brayfly; wing-castes blueish. Oliv.

A New Holland fpecies; the head dusky; thorax somewhat punctured at the margin; wing-castes polifhed, abbreviated, and obliquely fiated at the base; legs black.

**Planus.** Plane opaque and black; wing-castes very smooth. Fucely, &c.

Native of the fouth of Europe.

**Brunneus.** Ferruginous; wing-castes sub-afiated. Oliv.

Inhabits Sweden; and alfo Britain (Donov. Br. Inf.)

**Pygmæus.** Deep black; wing-castes very smooth. Linn.

Inhabits Europe.

**Depressus.** Depressed, black, and polifhed; wing-castes somewhat fiated. Oliv. Hifter, comprefus. Herbit.

Found under the bark of birch-trees in Germany (Paykull), and in Britain (Donov. Br. Inf.).

**4-Dentatus.** Depressed, black, and polifhed; wing-castes with a fingle flripe; jaws exercited, and longer than the head. Oliv.

Native of North America.

**Sulcatus.** Black; thorax with five falled lines, wing-castes three; the interlaces punctured. Oliv.

Inhabits Europe. Small; the head rather prominent each fide above the eyes; anterior legs toothed.

**Duodcem Striatus.** Black; polifhed; wing-castes with twelve flries. Marsh, &c.

Found in France (Vill.), in Sweden (Paykull), and in England (Donov. Br. Inf.).

**Violaceus.** Violaceous; thorax entirely dotted; wing-castes with five fERVED frizes at the base, tip dotted. Marsh.

Inhabits Britain. Length two lines and three quarters.

**Virescens.** Green; thorax entirely dotted; wing-castes with four fERVED frizes, the tip dotted. Marsh.

Perhaps a small variety of hifter violaceous; the length of the head a half inch.

**Picus.** Entirely pitchy; wing-castes length of the abdomen, with four frizes. Marsh.

Native of Britain; length one line.

**Oblongus.** Depressed, black, and polifhed; wing-castes fiated; body oblong. Fabr.

Inhabits Sweden, under the bark of the roots of the aft. Afzelius. Differs from H. fulcatus in the more oblong form of the body.

**Abreviatus.** Black; wing-castes with crenated frize, the inner ones abbreviate.

Native of America. Size of H. pygmæus.

**Sinicus.** Black, with a fimulate rubefus spot in the middle of the wing-castes. Fabr. Hifter reniformis. Oliv.

Wing-castes fiated at the inner edge, and smooth at the future. Inhabits Germany.

**Crucius.** Black; wing-castes teftaceous, with a common black crofs. Fabr.

Native of Barbary. Wing-castes smooth and polifhed, the future and fopt crffing in the middle black; hind margin black. Fabr.

**Maculatus.** Black; wing-castes fiated with a red spot behind. Donov. Br. Inf.

Inhabits Europe.

**Maculatus.** Black; wing-castes with two red spots on each. Oliv.

Native of Germany (Panz), also found in Britain (Donov. Br. Inf.)

**Aeneus.** Brayfly; wing-castes fiated at the base, and punctured at the tip. Fabr. Atelabus cyprius, Faurer.

Inhabits Sweden (Paykull), and Britain (Donov. Br. Inf.).

**Dentatus.** Black, polifhed; wing-castes pitchy, with dusky tip. Oliv.

Wing-castes with four oblique frizes at the base, the tip punctured. A New Holland fpecies.

**Picipes.** Oblong and black; wing-castes very short; antenna and legs pitchy. Oliv.

Inhabits Germany. Wing-castes abbreviated and not fiated.

**Cases.** Black; thorax with a transverse groove; antenna ferragineous. Herbit.

Native of Germany.

7 PARIUS.
HIS

PARVUS. Uniform black; wing-cases with six striae, two inner striae abbreviated. Marth.

A new species found in Britain.

QUADRIGUTTATUS. Black, polished, and very smooth, wing-cases dotted, with two pale yellowish spots on each. Fabr. Lately discovered in Pembroke shire. Donov. Tour Wales. Spots on the wing-cases white or reddish.

BIPUSTULATUS. Black, with a red spot in the middle of each wing-case; anterior flanks tridentated. Schrank, &c.

Hist. purpurascens, Paykull. Length two lines and a half; the species inhabits Sweden (Paykull), Germany (Panz), and Bohemia (Preys). Oph. This insect must not be confounded with the lighter bipustulatus of the Fabrician Suppl. a species twice the size of bimaculatus, and which inhabits India. The colour of this last-mentioned kind is deep black; wing-cases striated, with a red dot in the middle, and the head retuse.

Impressus. Deep black and polished; wing-cases striated, with two imperforated dots.

Size of lighter unicolor, but distinct in having the two imperforated dots in front of the head; all the flanks ferrated. Inhabit Kiel.

PULCHERULUS. Brassy-green; wing-cases striated, with a rufous dot behind; vent coppery. Fabr. Suppl. Small, and inhabits Tranquebar; head and thorax brassy-green, polished and immaculate; vent prominent.

ERYTHROPEUS. Deep black and polished; wing-cases striated, with the tip rufous. Oliv. Native of Tranquebar. Allied to hister bipustulatus.

PERFUSCUS. Rufous brown, and dotted. Marth. Length one-third of a line, and inhabits Britain. The form convex, dots not conspicuous without a lens.

MINIMUS. Black, very glabrous and polished. Marth. Scarcely so large as the last; country the same.

HISTLEA, in Ancient Geography, Orto, a maritime town of the island of Euboea, under mount Telethrius, near the mouth of the river Callias. It was situated on a rock, and therefore called Oceum.

HISTLEOTIS, a country of Thebess, situated under mount Ossa and mount Olympus, the latter lying to the N. and the former to the S. This country was also called the "Doric," from Dorus, the son of Deucalion, under whose reign it was inhabited by a Pelasgic nation, which was driven from it by the Cetanaeans. But, in process of time, the Persh_resolve, having destroyed the town of Histiaeus in the Isle of Euboea, caused its inhabitants to remove to the continent, who gave to the territory which they occupied, the name of Euboea, according to Strabo, but according to Herodotus, Histiaeotis. Allo, a small country in the island of Euboea, of which Histiaeus was the capital, and which extended to Artemission, towards the Canium promontory, at a little distance from Thermechla.

HISTIODROMIA, the art of sailing, or of conducting vessels on the sea.

The word is compounded of ἱστιος, sail, of ἰστιος, the mast of a ship, which comes from ἴστιος, be, I stand, and ἵστος, centre, of ἴστος, I stand. Histiodromia is the same with what we otherwise call navigation.

Histiodromia turns on four points, any two whereof being given, the other two are easily found from them, by the loxodromic tables, lines, tangents, secants, Mercator's charts, &c. These four things are, the difference of latitude, difference of longitude, the course, and the distance run.

HISTORICAL Painting. The derivation of the word historical, at once points out the proper application of it as descriptive of one particular application of the art of painting, (i.e.) the representation of events which have occurred, and which are fit subjects for the pen of the historian; but common custom applies it in a more extended, though very improper, sense, as descriptive, not only of what is directly historic, but what is also of the poetic or dramatic nature: and divides the last into four branches only, which are Historical, Portraiture, Landscape, and Still-life. See Painting.

HISTORICAL Style. See Style.

HISTORIOGRAPHER, composed of ἱστος, history, and γραφειν, to write, a professed historian, or writer of history, or a person who applies himself peculiarly to it.

The province of the historian is important and extensive; and he, therefore, ought to be endowed with great and uncommon qualifications. As it is the office of the historian to record truth for the instruction of mankind, impartiality, fidelity, gravity, dignity, and accuracy are indispensable and essential qualities belonging to a person who undertakes this office. He must neither be a pamphleteer nor a satirist. He must not enter into faction, nor give scope to affection: but contemplating past events and characters with a cool and dispassionate eye, must present to his readers a faithful copy of human nature. Cicero has given us the whole art of composing history in a very compendious and comprehensive manner. No one is ignorant, says he, that the first law in writing history is, not to dare to say any thing that is false, and the next, not to be afraid to speak the truth; that on the one hand there be no fulcram of affection, nor of prejudice on the other. These fundamental principles are generally known; but the superstructure confides partly in things and partly in the style or language. The former require an order of time, and description of places. And because in great and memorable events, we are desirous to know first their causes, and then the actions themselves, and lastly their consequences: the historian should take care of the springs or motives that occasioned them; and in mentioning the actions themselves should not only relate what was done or said, but likewise in what manner; and in treating of their consequences, shew whether they were the effects of chance, wisdom, or prudence. Nor should he only recite the actions of great and eminent personages, but likewise describe their characters. The style ought to be fluent, smooth, and even, free from that harshness and poignancy which are usual at the bar. De Orat. lib. ii. cap. 15.

According to this plan, in the observance of which few are superior to Tacitus, an historian should not only a man of probity, but free from all passion and bias; he ought to unite the frankness of a philosopher with the vivacity of a poet or orator. He should also possess a good judgment, to direct him what is proper to be said, and what to be omitted, and to treat every thing in a manner suited to its importance. This faculty will enable him to select such facts as are of the greatest moment; to represent them in conjunction
connection with their causes, to trace them to their con-
sequences and effects, and to unfold them in clear and distinct
order. Wildom is the great end of history. It is de-
digned to supply the want of experience; and though it
does not enforce its instructions with the same authority,
yet it furnishes a greater variety of instructions than it is
possible for experience to afford in the longest life. Its
object is to enlarge our views of the human character, and
to give full exercise to our judgment on human affairs.
It must not, therefore, be a tale calculated merely to please,
and addressed to the fancy. Gravity and dignity are essent-
ial characteristics of history; no light ornaments are to be
employed, no flippancy of style, no quaintness of wit. But
the writer must sustain the character of a wise man, writing
for the instruction of posterity; one who has studied to
inform himself well, who has pondered his subject with care,
and addresses himself to our judgment rather than to our im-
agination. At the same time, historical writing is by no means
inconsistent with ornamented and spirited narration. It ad-
mits of much high ornament and elegance; but the ornaments
must be always consistent with dignity; they should not ap-
pear to be sought after; but to rise naturally from a mind
animated by the events which it records.

Industry is likewise an essential quality of an accurate his-
torian. Thucydides in his History of the Peloponnesian War,
and Polybius in his History of the Roman Affairs, took great pains in procuring necessary information. An
historian should be always actuated by a love of truth; to
this purpose Polybius observes, that a good man ought to
love his friends and his country, and manifest a similar di-
position with theirs, towards both their friends and enemies.
But when he takes upon him the character of an historian,
they must all be forgot. In history, all personal considera-
tions should be laid aside, and regard be paid only to their
actions. Lib. i. p. 13. See also Lucian, De Hist. Scrib.
p. 366.

Suetonius, Thucydides, and Polybius are much com-
mended for the integrity and ingenuity of their temper.
Cicero observes, (ubi supra,) that history is conversant in
great and memorable actions; and therefore a historian should
always keep posterity in view, and relate nothing which may
not on some account or other be worth the notice of future
ages. Those who descend to trivial and minute matters,
which are below the dignity of history, should be deemed
journalists rather than historians. Whenever a prudent his-
torian thinks it necessary or convenient to take notice of
things that are in themselves less considerable, he either does
it with brevity, or for some apparent reason, or accounts for
it by some jilt apology. As it is the province of a historian
to acquaint us with facts, he should give a narration or de-
scription not only of the facts, or actions themselves, but
likewise of such things as are necessarily connected with
them, viz. the characters of persons, the circumstances of
time and place, in reference to which chronology and geo-
graphy have been called the two eyes of history; the views
and design of the principal actors, and the issue and event of
the actions which he describes. The proper dispositions of
these various particulars depends on the skill and prudence of
the writer.

The drawing of characters, says Blair, is one of the most
splendid, and at the same time, one of the most difficult
ornaments of historical composition. For characters are ge-
nerally considered as professed exhibitions of fine writing:
and an historian, who seeks to shine in them, is frequently
in danger of carrying refinement to excess, from a desire of
appearing very profound and penetrating. He brings to-
gether so many contrasts, and subtle oppositions of qualities,
that we are rather dazzled with sparkling expressions, than
entertained with any clear conception of a human character.
A writer who would characterize in an instructive and mat-
erly manner, should be simple in his style, and should avoid
all quaintness and affectation: at the same time not content-
ing himself with giving general outlines only, but defending
into those peculiarities which mark a character in its most
strong and distinctive features. The Greek historians
sometimes give elogiums, but rarely draw full and professed
characters. The two ancient authors, who have laboured
this part of historical composition most, are Sallust and Ta-
citus. In tracing actions and events which the historian re-
cords to their springs, and also to their effects and con-
sequences, two qualifications are necessary in order to his
doing this with success: viz. a thorough acquaintance with
human nature, and political knowledge, or acquaintance with
government. The former is necessary to account for the
conduct of individuals, and to give just views of their char-
acter; the latter to account for the revolutions of government,
and the operations of political causes in public affairs. Both
must concur in order to form a completely instructive his-
torian. With regard to the latter, the materials and means
of information, polished by the ancient historians, were more
cumbersome and limited than those of the moderns; far less
communication and intercourse subsisted between neighbour-
ing states, by the intervention of established ports, or of
ambassadors resident at distant courts. Besides, they wrote
for their own countrymen only; they had no idea of writing
for the instruction of foreigners, whom they despised, or
of the world in general; and hence they are less attentive to
convey all that knowledge with regard to domestic poli-
cy, which we, in distant times, would desire to have learned from them. Perhaps also, though in ancient ages
men were more abundantly animated with the love of liberty,
yet the full extent of the influence of government, and of po-
litical causes, was not then so thoroughly fructified, as it
has been in modern times; when a longer experience of all
the different modes of government has rendered men more
enlightened and intelligent, with respect to public affairs.
To the reasons now stated it is owing, that though the an-
cient historians fet before us the particular facts which they
relate, in a very beautiful and distinct manner, yet some-
times they do not give us a clear view of all the political
dignities which affected the situation of affairs, of which they
 trata. From the Greek historians, we are able to form but
an imperfect notion of the strength, the wealth, and the re-
venues of the different Grecian states; of the causes of sev-
eleral of those revolutions that happened in their government;
or of their separate connections and interfering interests.
In writing the history of the Romans, Livy had purely the most
ample field for displaying political knowledge, concerning
the rise of their greatness, and the advantages or defects of
their government. Yet the instruction, in these important
articles, which he affords, is not considerable. He is indeed
an elegant writer, and a beautiful relater of facts; but by
no means distingushed for profoundness or penetration. Sa-
llust, when writing the history of a conspiracy against the
government, which ought to have been altogether a politi-
cal history, has evidently attended more to the elegance of
narration, and the painting of characters, than to the un-
folding secret causes and springs. Instead of that complete
information, which we might naturally have expected from
him of the state of parties at Rome, and of that particular
conjunction
conjunction of affairs, which enabled so desperate a profligate as Catiline to become so formidable to the government, he has given us little more than a general declamatory account of the luxury and corruption of manners in that age, compared with the simplicity of former times. It is not meant, however, to confine all the ancient historians as defective in political information. No historians can be more instructive than Thucydides, Polybius, and Tacitus.

Thucydides is grave, intelligent, and judicious; always attentive to give very exact information concerning every operation which he relates; and to shew the advantages and disadvantages of every plan that was proposed, and every measure that was purposed. Polybius excels in comprehensive political views, in penetration into great systems, and in his profound and distinct knowledge of all military affairs. Tacitus is eminent for his knowledge of the human heart; is sentimental and refined in a high degree; conveys much instruction with respect to political matters, but more with respect to human nature.

The historian should also introduce pertinent and useful reflections on the course of his narrations. The best historians, such as Sallust and Livy, s.c. have allowed themselves this liberty. But the remarks or reflections of the historian should be brief, and differ in this respect from the encomiums or declamations of the orator. When observations are to be made concerning human nature in general, or the peculiarities of certain characters, the historian can artfully incorporate such observations with his narrative, they will have a better effect than when they are delivered as formal detached reflections. To this purpose we may observe, that in the life of Agricola, Tacitus, speaking of Domitian's treatment of Agricola, makes this reflection: "Proprium humani ingenii est, officie quern legem," i.e., "It belongs to human nature, to hate the man whom you have injured." This observation is just and philosophical; but the form, in which it stands, is abstract and philosophical. A thought of the same kind has a fine effect elsewhere in the same historian, when speaking of the jealousies which Germanicus knew to be entertained against him by Livia and Tiberius: "Anxius," says he, "occultis in se patrum aviaeque odio, quorum causa acieris quia iniqua." i.e., "Uneasy in his mind, on account of the concealed hatred entertained against him by his uncle and grandmother, which was the more bitter, because the cause of it was unjust." This profound moral observation is introduced, without the appearance of making it in form, as a part of the narration, in alligning a reason for the anxiety of Germanicus. Tacitus excels in a talent of intermixing after this manner the course of his narrative many striking sentiments and useful observations. For a more particular account of the distinguishing properties of historical narration; see NARRATION.

Historians have enlivened their narration, by introducing, on various occasions, speeches, which are either oblique or direct, the former excised by the historian in his own person. Of this kind is that of Hanaibal in Julius, by which he endeavours to persuade king Antiochus to carry the heat of war against the Romans into Italy. (Lib. xxxi. cap. 5.) And in the latter, the person himself is introduced as addressing his audience; and therefore the words, as well as the fenile, are to be accommodated to his character. Such is the speech of Eumenes, one of Alexander's captains and succourers, addressed to his soldiers, when they had traiterously bound him in chains, in order to deliver him up to his enemy Antigonus. Jutin, lib. xiv. cap. 4.

With regard to direct speeches, there are few ancient historians who have not adopted them, though some of our critics will only admit those which were really spoken by the persons to whom they are ascribed. The first historian who introduced complete and finished speeches into history, is said to be Thucydides, those of Herodotus being but short and imperfect. (See Oration.) Letters are sometimes met with in histories, as well as speeches: such are those of Alexander to Darius in Q. Curtius, lib. iv. cap. 1. and those of Tiberius and Drusus in Tacitus, Ann. lib. i. 77. iii. 53-59. Digressions also, when they are neither too long nor too frequent, may be so managed by the historian, as to afford the reader both delight and profit. (See Digression.)

With regard to the order of history, the historian should form his introduction, as to give some general view of the subject, to engage the reader's attention, and to propitiate him with a candid opinion of himself and of his performance; this should be natural, and proportioned to the extent of the work. Such are those of Livy, Herodotus, Thucydides, Tacitus, and others. But order is to be principally regarded in the body of the work; for this purpose the historian should either attend to the time in a chronological feries, which is best in biography, after the manner of Plutarch and Cornelius Nepos; in the history of particular states, after Thucydides, Livy and Tacitus; and sometimes also in a general history; though in this latter case, the order of time cannot always be preferred, and therefore the actions of each nation, when several states are independent of each other, must necessarily be separated, in order to prevent confusion. This is the method adopted by Herodotus, Dionysius Siculus, and Jutin.

There is one circumstance that defers to be particularly mentioned, because it defers the first attention of the intelligent and instructive historian; and this is, that in the conduct and management of his subject he should give it as much unity as possible; in other words, his history should not consist of separate unconnected parts merely, but should be bound together by some connecting principle, which shall make the impression on the mind of something that is one, whole and entire. Whether pleasure or instruction be the end sought by the study of history, either of them is enjoyed to much greater advantage, when the mind has always before it the progres of some one great plan or system of actions; when there is some point or centre to which we can refer the various parts related by the historian. Of all the ancient general historians, the one who had the most exact idea of this quality of historical composition, though, in other respects, not an elegant writer, was Polybius. In his third book he sketches out his own plan; observing, that the subject of which he had undertaken to write is, throughout the whole of it, one action, one great spectacle; how, and by what causes, all the parts of the habitable world became subject to the Roman empire. "This action," says he, "is distinct in its beginning, determined in its duration, and clear in its final accomplishment; therefore, I think it of use to give a general view before-hand, of the chief incidents of which make up this whole." In another place, he congratulates himself on his good fortune, in having the subject for history, which allowed such variety of parts to be united under one view; remarking, that before this period, the affairs of the world were scattered, and without connection; whereas, in the times of which he writes, all the great transations of the world tended and verged to one point, and were capable of being considered as parts of one system.

Those who write the history of some particular great transation, confining themselves to one era, or one portion of the history of a nation, have such great advantages for preserving historical unity, that they are inexculpable if they fail in it. Sallust's histories of the Catilinarian and
So numerous and considerable are the qualifications necessary for an historian, that this province was formerly assigned by the ancient nations to a particular order of men; and both among the Greeks and Romans it was generally undertaken by persons of figure, and such as were eminent for learning, knowledge of the world, and other great abilities; and as it is of such singular service to mankind to have the records of past ages well and faithfully transmitted to posterity, it is to be wished that persons of similar character would, in all countries, undertake it.

Having illustrated the qualities of a good historian by direct or indirect references to ancient writers, it may not be improper to specify some instances in which the moderns have excelled in this kind of writing. Dr. Blair selects Italy as the country in Europe where the historical genius has, in latter ages, shone forth with the greatest lustre. Soon after the publication of letters, Machiavel, Guicciardini, Davila, Bentivoglio, father Paul, became highly conspicuous for historical merit. All of them appear to have conceived very just ideas of history; and are agreeable, instructive, and interesting writers. They are not, however, without some imperfections, which have been pointed out by critics, and detailed by Blair. Among the French, many historical writers are spirited, lively, and agreeable; and some of them not deficient in profundity and penetration. Nevertheless, France has not produced any such capital historians as Italy. In our own island, Scotland acquired reputation; at an early period, by means of the celebrated Buchanam. He is an elegant writer, classical in his Latinity, and agreeable both in narration and description; but subjected to be more attentive to elegance than to accuracy; and inaccurate and imperfect in his political views; and charged with being deeply tainted with the spirit of party. Among the older English historians, the most considerable is Lord Clarendon: more impartial in his relation of facts than might have been expected, and distinguished by the spirit of virtue and probity which pervades his work. He maintains the dignity of his historians; and though his sentences are too long and his general manner prolix, his style is, upon the whole, manly; and his merit, as an historian, much beyond mediocrity. He is particularly admirable, and perhaps we may say unequalled in the drawing of characters. Some have asserted that he was the first Englishman who seems to have attempted to write history with any degree of dignity. But this assertion is not strictly accurate. Sir Walter Raleigh and Knowles made the attempt before him, and with no small success, and we may affirm the same, in a great degree, concerning Sir Francis Bacon and Lord Herbert of Cherbury. However, Clarendon has, in this respect, exceeded all his predecessors. Bishop Burnet is lively and peripatetic; but his style is too careless and familiar for history; his characters are marked with a bold and a strong hand, but they are generally light and satirical; and he abounds too much in little stories concerning himself, that he recommends more a writer of memoirs than of history. For a just appreciation of his character as an historian, see the article Burnet. During a long period, English historical authors seemed to aim at nothing higher than an exact relation of facts; till of late the distinguished names of Hume, Robertson, and Gibbon, have raised the British character in this species of writing to high reputation and dignity. Dr. Blair observes, that of late years a great improvement has begun to be introduced into historical composition; which conflicts in a more particular attention than was formerly given to laws, customs, commerce, religion, literature, and every thing else that tends to throw the spirit and genius of nations. An historian is now expected to exhibit manners, as well as facts and
and events; and it must be allowed, that whatever displays the state and life of mankind in different periods, and illustrates the progress of the human mind, is more useful and interesting than the detail of fages and battles. The introduction of this improvement into history has been chiefly owing to the celebrated M. Voltaire, whose age of Louis XIV, commanded the attention, and claimed the approbation of all Europe. See farther on this subject Ward's Oratory, vol. ii. sects. 42, 43, and 44. Blair's Lectures, vol. iii. sect. 36.

The term historiographer is chiefly used for a person who has a peculiar charge and commission to write the history of his time. The historiographer to his majesty is an officer under the lord chamberlain; his salary 200l. per annum. There is an office of the same kind in Scotland with the same salary.

History, a recital or description of things as they are, or have been in a continued orderly narration of the principal facts and circumstances attending them. The word is Greek, ἱστορία, historia; and literally denotes a search of curious things, or a desire of knowing, or even a rehearse of things we have seen; being formed of the verb ἱστορέω, which properly signifies to know a thing by having seen it; though the idea appropriated to the term history is now much more extensive, and we apply it to a narration of divers memorable things, even though the relation only takes them from the report of others. The origin of the word is from the verb ἤστοι, I knew; and hence it is, that among the ancients several of their great men were called ἱστορίης, q. d. orators of various and general knowledge.

History is divided, with regard to its subject, into the history of nature and the history of actions. History of Nature, or Natural History, is a description of natural bodies; whether terrestrial, as animals, vegetables, fosils, fire, water, air, meteors, &c. or celestial, as the stars, planets, comets, &c. Natural history is much the same with what we otherwise call physiognomy. See Natural History and Physiology.

History, with regard to actions, is a continued relation of a series of memorable events in the affairs either of a single person, a nation, or several persons and nations, and whether included in a great or little space of time; or, if it is a narrative of such facts as are fit to be transmitted to posterity for the use of mankind and the better conduct of human life. Cicero calls history the milieu of life, (De Orat. lib. ii. cap. 6.) and it teaches us both what we ought to pursue and what we ought to avoid.

Thus Thucydides, among the ancients, excellently translated by Smollett, and among the moderns, Stanyan, Leland, Gibbs, Mitford, the abbe Barthelemi in his Travels of Asia Minor, have written the History of Greece; Livy, among the ancients, and among the moderns, Caton and Rouge, Rollin, Vertot, Hooke, Ferguson, Montesquieu, Crevier, Gibbon, &c. that of Rome; Mezeray and F. Daniel, of France; Tyrell, Echard, Rapin, continued by Tindal, Carte, Guthrie, with the supplement of Ralph, Hume continued by Smollett, Henry, &c. Kenneth, in his complete history, including the works of several writers, of whom the most distinguished, in point of historical composition and merit, are Milton, Daniel, Bacon, lord Herbert, Camden, and Wilton, &c. the History of England; Buchanan, not to mention John Major and Hector Boethius, whose works are now almost obsolete, Robertson, whose history is a classic production, and is thought by many to be the doctor's "Palmarium Opus," G. Stuart, Sir D. Dallymple, lord Hailes, Guthrie, &c. &c. of Scotland; O'Connor, Valancy, Ferdinand Warner, O'Halloran, Leland, Crawford, Carte in his Life of the Duke of Ormond; sir James Ware in his Lives of the Bishops and Writers of Ireland, improved and enlarged by Mr. Harris, &c. &c. of Ireland; Dr. Powel, Warrington, &c. of Wales; Clarendon, the History of the Rebellion; and Thuanus, bishop Burnet, &c. the History of their own Lives and Times.

Eusebius, Baronius, &c. have written the History of the Church; bishop Burnet that of the Reformation, &c.

Several authors have written on the Method of reading and studying History; among the rest Lucian, Bodin, Vossius the Elder, Weier, Patrici, Benii, Maestari, De Silhon, P. le Moine, F. Rapin, the abbot De Ste. Real, F. Thomasin, Freminy, Petitlay, &c.

One of the most useful attempts for facilitating the study of history, says Dr. Predikey in his Lectures, (Lect. 17,) is to begin with authors who present a "Compendium," or general view of the whole subject of history, and afterwards to apply to the study of any particular history, with which a more thorough acquaintance is desired. The most celebrated epitome of universal history written in Latin, is Turfanian's, which is read in most of the foreign universities. Boffet's Epitome of Universal History, is greatly and deservedly admired in France; but it brings the history no lower than the time of Charlemagne. One of the most useful epitomes, upon the whole, is that written by baron Holberg in Latin, and translated with improvements into English by Dr. Gregory Sharpe. Its principal defect is, that too little notice is taken of the history of Greece, and that other subjects are despatched with too much brevity. The most valuable of the larger kind of epitomes are Rollin's of the ancient history, and Pelfendorf's of the modern. One of the most obvious contrivances to reduce history into a short compass, and to make an entire course of it easy to be comprehended, and at the same time to obviate a proper distinction between the parts of it, has been by "Chronological Tables." See Chronology.

Much of the perpicuity of history depends on conceiving clearly the order of generations and the right of succession in regal and other families. In this respect, "Genealogical Tables" are of unpeakable use (See Genealogy.) But the most ingenious and useful contrivance to facilitate the study of history, and to aid the imagination in conceiving distinctly, and comprehending the whole course of it, in all its parts, co-existent and successive, is the "Chart of History." This is properly a picture of all history, and is formed by such natural methods of expression, that it renders visible to the eye, without reading, the whole figure and dimensions of all history, general and particular, and so perfectly shews the origin, progress, extent, and duration, of all kingdoms and states that ever existed, at one view, with every circumstance of time and place, uniting chronology and geography, that it not only, in the most agreeable manner,refreshes the memory without the fatigue of reading; but a novice in history may learn more from it by a more attentive inspection of a few hours, than he can acquire by the reading of many weeks or months. This chart must answer, in the completed manner imaginable, almost every use of a compendium of history, proper to be read before a larger and fuller course be entered upon; and it will prevent any confusion which might arise from reading particular histories without a regard to their proper order of time or place, better than any abstract of universal history whatever. For by calling our eye for a minute upon this chart, we see, at one glance, the contemporary state of the whole world at the period of which we are reading, and the preceding and succeeding state of the particular country,
the history of which we are studying. Dr. Prieckley has
contructed a chart of this kind, of the same size with his
chart of biography, drawn upon a like scale, and made
to correspond to it in all respects. Among other methods
of illustrating and retaining history, we may mention
Mr. Grey's "memorial lines," serving to aid us in recol-
lecting dates with exactness. To this we may add the use
of a "common-place book," in which the most valuable
fruits of history may be repotted.

We shall here subjoin the order in which the principal au-
tors of antiquity should be read, as to obtain from them
a regular series of facts, comprising the history of Asia,
Africa, Greece; and Rome, till the dissolution of the empire of
Constantinople. The oldest history extant, next to the histori-
cal books of the Old Testament, is that of "Herodetus," who
flourished about 450 years B.C., a little after the invasion
of Greece by Xerxes. His history comprises probably every
thing which he had an opportunity of learning concerning the
history of the Lydians, Ionians, Lycians, Egyptians, Persians,
Greeks, and Macedonians; and, coming from the earliest
of his accounts to the latest, his history may be reckoned to
commence about 713 years B.C., and to reach to about
the year 479 B.C.; a period of about 234 years. A more
particular account of several things in the period of which he
writes, may be extracted from the following authors: viz.
Julin (1 i. ii. iii. and vii.). Xenophon's Cyropadix, and
the lives of Aristides, Themistocles, Cimon, Miltiades, and Pau-
fanias, written by Plutarch and Cornelius Nepos; and those of
Anaximander, Zeno, Empedocles, Heraclitus, and De-
谟critus, by Diogenes Laertius. Next to Herodetus,
"Thucydides" should be read. Introdutory to his history
of the Peloponnesian war, which was his principal and pro-
fessed subject, he gives a summary view of the history of
Greece, from the departure of Xerxes to the commence-
ment of that war, which connects his history with that of
Herodotus. To complete the period comprehended by
his history, after his first book, the eleventh and twelfth
books of Diodorus Siculus should be read, together with
Plutarch's Themistocles, Aristides, Paufranias, and Cimon,
and the second and third books of Júflin. &nd, after the
whole of Thucydides, the historical student should read the
lives of Alcibiades, Chabrias, Thrasybulus, and Lydas,
written by Plutarch or Cornelius Nepos, the fourth and fifth
books of Julin, and the first book of Orofius. After
Thucydides, the first and second books of "Xenophon's
History of Greece" should be read. This completes the
history of the Peloponnesian war, with the contemporary af-
fairs of the Medes and Persians. After this, let the student
proceed to the "expedition of Cyrus," and the return of the
Greeks; and lastly, the remainder of his history of
Greece, which contains an account of the affairs of the
Greeks and Persians to the battle of Mantinea, which
happened in the year 363 B.C.; so that all the historical books
of Xenophon comprise a period of about 45 years. To
complete the history of this period, recourse may be had to the
lives of Lyfander, Agellians, Artaxeres. Thrasybulus,
Chabrias, Conon, and Datars, written by Plutarch or Cor-
nelius Nepos; the fourth and fifth books of Julin; and the
thirteenth, fourteenth, and fifteenth of Diodorus Siculus.
After Xenophon's works let the fifteenth and sixteenth
books of Diodorus Siculus be read; these contain the his-
tories of Greece and Pergia, from the battle of Mantinea to
the beginning of the reign of Alexander the Great, in the
year 336 B.C. After these two books of Diodorus, let
Arian's history of Alexander be read; and for completing this
history, let the reader recur to Quintus Curtius, the
tenth and eleventh books of Julin, and Plutarch's life of
Alexander. After Arrian, let him peruse the eighteenth,
nineteenth, and twentieth books of Diodorus Siculus, which
contain the history of Greece from the year 323 B.C. to
the year 201; and to complete this period, the thirteenth, four-
teenth, and fifteenth books of Júflin, and the Demetrius
and Eumenes of Plutarch. After the books of Diodorus,
read from the sixteenth to the twenty-ninth book, inclusive,
of Júflin, which brings down the history to about the
year 195 B.C. After Júflin, read Plutarch's lives of
Perrhus, Aratus, Agis, Cleomenes, and Philopoemen.
The lives of illustrious men written by Plutarch, who
flourished about the year 150 after Christ, make as ex-
cellent supplement to universal history, as the history furnised
by these lives of Plutarch, read the frag-
ments of Diodorus. Lastly, in the regular order of history,
read the thirty-first book of Júflin, and all that follow till the
two last, which completes the history of Greece till it is
blended with that of the Romans. All the histories above-
mentioned are written in Greek, except those of Júflin,
Quintus Curtius, and Cornelius Nepos, which are in
Latin.

The following course of "Roman History" may be con-
idered as comprehending all that is now to be learned of the
subsequent ancient history of all other nations, besides Greece
and those comprehended in its history. The writer who
reads the early part of the Roman history, in the fullest
and most satisfactory manner, is "Dionyfus of Halicarn-
assus," who brought down the history of Rome as far as the
beginning of the first Punic war. But of his work, which
contains of twenty books, the eleven first are all that are
extant, and they end at the year 341 B.C., the time when the
consuls returned the chief authority in the republic; after
the dissolution of the decemvirs. To complete the history of
the period of which he treats, read Livy (i. ii. iii. and iv.),
Plutarch's Romulus, Numa, Pomptilis, Valerius Poplicola,
Coriolanus, and Camillus. After Dionyfus, read from the
fourth to the tenth book inclusive of Livy, which brings
the history of Rome to the year 92 B.C. To supply the
chasin between the tenth and twentieth books of Livy, read
Polybius, particularly the first and second books, which treat
chiefly of the first Punic war; the epistle of the second
decade of Livy, books seventeen, eighteen, twenty-two, and
twenty-three of Júflin, fourteen chapters of the fourth
book of Orufius, the fourth and fifth of the third book of the
"histoire micellaires" of Paulus Diaconus, Plutarch's Mar-
cellus, and Fabius Maximus; the second two of the Annals of
Zonaras, and Appian's Punic and Illryan wars. After
Appian should be read the remainder of Livy, from the
twenty-first book to the end, which brings the history to the
year 166 B.C., and the epitome to the end. To complete
the last books of Livy, read Plutarch's Hamilcal, Scipio
Africans, Quintus Flamininus, Paulus Emilius, and Cato
Major. After this read his Gracchi, Marius, Sylla, Cato
Minor, Sarrorius, Lucullus, Pompey, and Brutus. The
reader of history must next proceed to Sallust's history of
the war of Jugurtha, which happened 100 years B.C., and
of the conspiracy of Catiline, which happened 62 years B.C.
Next should follow Julius Cesar's Commentaries of his own
wars, and the supplement by Hirtius and others. To ob-
tain a clear idea of this important period of time, Cicero's
epistles, especially those to Atticus, should not be overlooked.
The history of Dio Caiius comprised all the time from the
building of Rome to the reign of Alexander; but to suply
the want of the last twenty, we must be content with what
Xiphiplus, who wrote A.D. 1505, has given us in a com-
pendium of them. The period of which Dio Caiius treats
will be made more complete by Velleius Paterculus, who
lived
HISTORY.

Lived under Tiberius. We should then have recourse to Sustonius's lives of the twelve Cæsars; and next to Tacitus's annals and history. This history contains a fund of political knowledge, and, on that account, is very proper to be studied by princes and ministers of state. Tacitus is the last Roman historian who is worth reading, except barely for those facts which we have no other method of becoming acquainted with. Sustonius and Tacitus are generally placed in what is called the "silver age" of the Latin tongue; but all the succeeding writers are universally thrown into the "brass," or "iron" age. These, in the order according to which they should be read, are, the lives of Nerva and Trajan by Aurelius Victor or Xiphilin, Spartan's Adrian, Capito- linus's Antoninus, Herodian, the Scriptores Romani, or Hilaris Augusti Scriptores, viz. Spartanus, Lampridus, Capitolinus, Vulcius, Trebellius Pollio, and Vopiscus supplying the chasm in these writers between Jordanian III and Valentianum, from Aurelius Victor, and then the history will be brought down to A.D. 284. Eutropius will furnish a good epitome of the Roman history till about this time, in Latin. All the writers of the Roman history from this time are Greek, except Ammianus Marcellinus; they are Zonaras, A.D. 507; Zonaras, A.D. 1119; Jornandes, A.D. 540; Ammianus Marcellinus, A.D. 375; Procopius, A.D. 502; Agathias, A.D. 567; Nicetas Acominatus, A.D. 1203; Nicephorus Gregoras, A.D. 1341; and Johannes Cautacenus, A.D. 1350. In this enumeration we ought not to have omitted a celebrated female historian, viz. Anna Comenius, the daughter of Alexander I., emperor of Constaninople, who wrote the history of the reign of her own father, in which she makes the first mention of the arrival of the crusaders at Constaninople, and gives an account of their conduct during their residence in that city, and their passage into Asia. Her narration is not very favourable to the crusaders. The conclusion of the history of Constaninople, with the rise and progress of the Turks, may be learned from Laonius Chalcouides, who put an end to it. He begins his history with Ottoman, the son of Orthoguli, who began to reign about the year of Christ 1000. His work consists of ten books, and brings the history to the year 1453, in which Constaninople was taken by Mahomet II.

Of all the modern compilations, derived from these sources of historical knowledge, none are so useful as those which treat of the manners, customs, and laws of the Greeks and Romans. The most complete body of Greek and Roman antiquities is that of Grevius and Gronovius; but this is voluminous and expensive. A person may acquire knowledge enough of this kind, for the purpose of reading the Greek and Latin historians, in Potter's excellent and copious lexicon of Greek antiquities, and in Kenett's Antiquities of Rome. Books which contain collections of coins and inscriptions should not be neglected; the principal collectors of these kinds of records are Gruter, Lippsius, Chirchill, Montfaucon, Pridiae, Mazochius, and Fleetwood for inscriptions; and Spanheim, Urfinus, Patin, Valliant, Hardouin, and Goltzius for coins. In studying the Roman history, a person should become conversant with the civil law, which contains the history of the domestic policy of that great people. He should therefore acquaint himself at least with "Jaffinian's Institutes;" which contain an authentic outline of their policy. The modern compilations on ancient history are very numerous, but the most complete are "Rollin's" and the "Universal History." Rollin's ancient history has been often recommended to young persons, and it well deserves their attention. Though the author it only a compiler, he is eloquent. He always writes on the side of virtue, and his moral reflections are useful; though he cannot be doubted as distinguished by an extraordinary degree of critical sagacity. The "Ancient Universal History" is a work of established reputation and utility. Its references to original authors are numerous, and though it is, with respect to judgment and style, very unequal, and its chronology is various, as it was executed by different persons, yet it indicates unquestionable traces of labour in research, and impartiality in detail. Its faults, compared with its excellencies, are trifling. The oriental part is particularly entitled to applause, as it conveys a variety of knowledge, which could not otherwise have been easily obtained. One principal advantage is, that it gives a separate history of every individual nation, however inconsiderable; so that we see at once its relative importance, and its connection with the greater empires, by which it might, at length, be swallowed up. The best editions of the ancient universal history are, that in folio, and the first which appeared in 8vo.

As for those who wish to study the English history by the perusal of the works of original writers, and who have leisure for this purpose, we would refer them for an account of them to Nicholson's English Historical Library. Hence, and from other sources of information, they will be led to acquaint themselves with Gildas, the most ancient British historian, who was born in the year 520, and published his treatise "De excidio Britanniae" towards the close of his life; the venerable Bede, who was born in 672 or 673; Nennius in 830; Holc Ulfa's laws, enacted about the middle of the tenth century; Geoffrey of Monmouth, about the year 1150, the greater part of whose work is fabulous; Caradan, monk of Lancaur, contemporary with Geoffrey, who wrote a history of the petty kings of Wales, translated from the Latin original into English, by Humphrey Llwyd, and enlarged by Dr. Powell, and again by W. Wyn. The oldest history of the Saxon affairs is the "Saxon Chronicle," first published by Abraham Wheelock, the work of unknown authors, and terminating at various periods from 577 to 1154. The earliest account we have of the reign of Alfred is that of Asserius, his contemporary; the next Saxon historian is Ethelward, or Edward Patri- tius in 959, who continued his chronicle of the Saxon kings no farther than Edgar. Many things relating to the civil government of these times are differed in some particular lives of their kings and kings; particularly those of Olaf, Olaf, Ethelwald, and Edward the Confessor. Of the later writers of the Saxon affairs we may mention Verri- lagen in his "Restitution of decayed intelligence in Antiqui- ties," corrected by Seringiana and Somer; Schelcen in his "Analecta," and Selingham in his treatise "De Anglorum gentis origine." The "Sachten Spiegeler," or "Speculum Saxonicum," is an excellent manual of the old laws of the ancient Saxons. The history of Great Britain, in certain periods of it, is much connected with the histories of Norway and Denmark; and therefore the Danish antiquities should be investigated, and the runes characters understood. The Danish antiquity should also be acquainted with the belt Scandanavian historians, the most ancient of whom is Aras Fride, contemporary with Saxound, about the year 1124; part of whose history of Iceland was published in 1689 by the bishop of Skalholt. There are two Norwe- gian histories which should be consulted; the former written after the year 1310 by Theodoric, a monk, and the other compiled by Ernur Sturlusorin, each of whom draw their materials from the ballads of the Scalds, whose his- torical poems, it is generally thought, may be depended upon.
HISTORY.

Two Danish historians, of principal importance to the English antiquary, in the judgment of Mr. Nicholoff, are Saxo Grammaticus, and his contemporary Sweno Agonis, of both which we have an excellent edition by Stephanus. The former died at Rollofshend and by his own account, he compiled his history out of the Icelandic ballads; and Sweno declares that he compiled his from the traditions of old people. The great restorer of the decayed antiquities of Denmark was Olaus Wormius, in his "Literaturum Runicae," and "Monumenta Danica," to whose discoveries an addition has been made by Thomas Bartholine. Much light has lately been thrown on this subject by various antiquaries, and particularly by Mr. Jonstone, professor Thorkelin, and Mr. Pinkerton. The first of our English historians after the conquest was Ingulphus of Croyland, who begins A.D. 626, and ends A.D. 1089. About the same time Martanus Scotus brought down our English history as low as the year 1083. The earliest history in the 12th century was written by Florentius Bravonius, a monk of Worcester, whose book ended with his life in 1119; but it was continued 50 years farther by another monk of the same monastery. Our next historian was Eadmerus, a monk of Canterbury, whose "Historia Novorum," &c. was published by Mr. S. Iden, and extends from 1066 to 1122. William of Malmesbury is one of the most important and valuable of our ancient historians. He is highly commended by Leland and others. He wrote "De gestis regum Anglorum" in five books, with an appendix in two more, which he styles "Novellae historiae." His history comprehends the affairs of England from the first arrival of the Saxons to the close of the reign of king Stephen. Simeon Danelensis, monk of Durham, in 1164, author of "De Cæsis Regum," accomplished the chronicles with the death of Edw. in 1132 and ends in 1129. Earlred, abbot of Rievaulx, gives a short genealogy of our kings to Henry II., but chiefly enlarges in praise of David king of Scots, founder of many Cistercian abbeys. About the same time flourished Henry, archdeacon of Huntington, whose eight books, concluding with the reign of king Stephen, were published by sir Henry Savile. William of Newbury begins at the death of Henry I., and ends in the year 1127. The 13th century begins with Gervase monk of Canterbury, who is said to have been a judicious antiquary and methodical historian, and to have made an excellent collection of the British and English history from the arrival of the Trojans to the year 1200. All that is extant commences with the year 1112, the 12th year of Henry I., and ends with the death of Richard I. It bears the character of being executed with great judgment. Contemporary with these two was Roger de Hoveden, chaplain to king Henry II., who has deduced our history to the year 1202, the 4th year of king John's reign. The next historian of note is Ralph de Diceto, dean of London, who, about the year 1210, composed two treatises, entitled "Abbreuisiones Chronicorum," comprising an abstract of our history, chiefly ecclesiastical, down to the conquest, and "Imagines historiarum," containing the history of some of our kings, terminating with the first year of king John's reign. So much admired this author and his works. These writers were soon succeeded by Matthew Paris, a monk of St. Albans, who is reckoned the first in value and reputation of all our ancient historians. His history comprehends a very important period, from the years following the death of William I. to the end of that of Henry III., and the information it contains is equally curious and useful. His mode of writing is, on the whole, pleasing and agreeable, and his composition simple and perspicuous. The spirit with which he exposes the pretensions and conduct of the Roman pontiffs is admirable; and it is no wonder that, on this account, he should be disparaged by Bellarmin, who styles him "Baronius." His history was first published at London, in 1571, and at Zurich in 1589. It was revised and corrected in 1606; but the best edition is that of Dr. W. Watts in 1642. Watts's edition again appeared in 1684, but this edition is not equal to the first impression. The 14th century begins with Thomas Wikes, whose history begins at the conquest, and ends at the death of Henry I., A.D. 1134. Nicholas Trivet, who was buried in the year 1238, and his contemporary, Roger Celfrensis, deserve curiously mention. The chronicle of John Brompton begins with the coming in of Angilulf the monk in 528, and ends with the death of Richard I. A.D. 1198: this author has given a collection and version of the Saxon laws in Latin, made in the time of Edward III. The chronicle of Walter Hemmingsford, who flourished in the reign of Edward III., begins in 1266 and ends with the year 1268. Ralph Higden wrote a history, styled "Polychronicon," chiefly compiled from the writings of other, and old chronicles now lost. He died in the year 1377. John, vicar of Tintwistle, was a great collector of English histories, which he digested in three very large volumes; they chiefly relate to the miracles of English saints. He was a monk of St. Alban's in 1306. Matthew, a Benedictine monk of Welminster, was a great collector of former historians, and therefore usually styled "florilegus." His history ends at the year 1377, which he probably did not long survive. It was continued by others; chiefly by Adam Merimuth, canon regular of St. Paul's, who begins in 1392, and ends in 1380, probably the year of his death. Henry Knighton wrote a chronicle in the time of Edgar, in 958, to the year 1357, the 19th year of Richard II., in whose reign he lived. Although he does not rank high as an historian, he is valuable for the account he gives of the proceedings against Richard II. from which it appears how free our constitution was understood to be at that period, and how great were the prerogative and power of parliament. His "Chronicon de Eventibus Angliae," and his "Historia depopitionis Ricardi secundi," are both preferred in Twifden's "Decem Scriptores." The 15th century was one of the most rude and illiterate ages. Amongst the few eminent for learning was Sir John Froissart, whose work contains a general history of the affairs of France, Spain, and other parts of Europe; but he also particularly inlists on the wars between the English and French, from 1333 to 1420. (See his biographical article.) The next historian worthy of notice is Thomas Walthingham, a monk of St. Albans, and probably regius profitor of history in that monastery, about the year 1430. His short history begins at the conclusion of Henry the Third's reign, where Matthew Paris ends, and is continued to the end of Henry V. His "Hy- podigma Neutierius," regards the affairs of Normandy from the time of Rollo to the sixth year of Henry V. in which are many occurrences not elsewhere to be found. William Caxton continued a history begun by the monks of St. Albans, which commenced with the first inhabitants of this island, to the last year of Edward IV. 1483. The whole work bears the title of "Fructus Temporum." John Rolfe travelled over England, and made collections out of the libraries to which he had access, pertaining to the history and antiquities of this kingdom. They are preferred in the British museum; and contain many particulars that illustrate the antiquities of the English nation. Of the histories above noticed, those whose works are entitled to diligent perusal by the historical student, are Ingulphus, Eadmerus,
William of Malmbury, Roger de Hoveden, William of Newberry, Matthew of Paris, Matthew of Wiltminton, Henry Knighton, and Froissart. Most of our ancient historians will be found in Sir Henry Savile’s “Quinque Scriptores Anglicae Historie,” 1596; in the “Decem Scriptores’” of 1629; in the “Decem Scriptores” of Twifden, in 1652; in the “Rerum Anglicarum Scriptores,” published at Oxford in 1684; and in the two volumes of Dr. Gale, the first containing five, and the second 15 historical writers. There are separate editions of Merianus and Duodecimus, of Florentius, of Eadmerus, of Matthew Paris, of Trivet, of Matthew of Wiltminton, of Froissart, of T. Waltoningham, and of W. Caxton. Of the historians in the 16th century, we may mention Robert Fabian, who died in 1512, whose “Historiarum Concordiandarum” bring down the history from Brutus to William the Conqueror, in the first six books; and in the seventh he gives the history of our kings from the Conqueror to Henry VII. Polydore Virgil, an accomplished writer, who wrote the history of our nation in Latin to Henry VIII. Edward Hall, who died in London in 1547, and who wrote a diffuse account of the wars between the houses of York and Lancaster, dedicated to Henry VIII.; Harrington and Hollinghead, whose chronicle is greatly esteemed; the second edition of this history was continued to the year 1586 by John Hooper, alias Vowel. In the 17th century the first author who occurs is John Stow, who was an industrious student, and a critical collector; he died in 1665; John Speed wrote a chronicle, which is the largest and the best, says Nicholsan, that is extant; it begins with the first inhabitants of this island, and ends with the union of the two kingdoms under king James, to whom it is dedicated; Richard Baker, who died in the Fleet, in 1644, published a chronicle, which was well received; the author himself wrote the history of our kings from the Romans to the end of the reign of James I., and it was continued to the restoration by Edward Philip. In later times we have had a great number of historians, or compilers of history. Among these we may enumerate Sir WIncholton Churchall, Sandford, Brady, a zealous advocate for the royal prerogative, Tyrell, a zealous defender of the ancient rights and privileges of the people, Echard, now almost forgotten; Carne, a non-juror and Jacobite, whose general history, notwithstanding his peculiar opinions and attachments, is undoubtedly a production of great merit in point of information; Guthrie, much neglected, but undeservedly, as he is a faithful and diligent writer, who had recourse to original evidence, though in the latter part of his work he inclines too much to Tory principles; and Ralph, whose critical history of the reigns of Charles II. and James II. is a supplement to Guthrie, and is a curious and valuable performance. The more considerable historians, whom we shall mention, are Charendon, whose history we have already given an account; Whitelocke, whose Memorials contain a rich repository of most valuable materials; Ludlow, an honest and zealous republican; Burnet (see his article, and above); Rapin, who spent 20 years in the composition of his excellent history, and who, though tedious, is on the whole faithful and impartial; Thudal, the continuator of Rapin; Hume, Smollett, Henry, Lyttelton, Harris, Macaulay, &c. &c. &c.; and a great number of others, who have written histories of particular lives and reigns, and whose names we cannot recite.

History, with respect to time, is divided into ancient and modern, distinguished into several epochs, periods, and intervals. The three periods of time into which history has been divided are the following, viz. the first, from the creation to the deluge, which age is reckoned uncertain, because we know no more than the short account given of it in the holy scriptures; the second, from the deluge to the first Olympiad, which, from the many feigned stories related in it, is called the fabulous age; the third, from the first Olympiad to our own times, is called historical, because the actions done in that period are recorded by writers of true history. See Age, and Chronology.

The most ancient of the Greek historians now left is Herodotus, who lived, according to Sir Isaac Newton’s Chronology, 157 years after the building of Rome. And as to the Romans, Livy himself confesses, that there were scarcely any certain memoirs of their affairs till the city was taken by the Gauls, which was above 100 years later than Herodotus; the accounts before this time having been preferred chiefly by tradition.

History, with respect to its subject, is divided into universal and particular, sacred and profane.

F. Meneloff gives us the proper characters of the divers kinds of history with great accuracy. He distinguishes history with regard to both its matter and its form, and gives curious influences of each particular.

History, sacred, is that which lays before us the mysteries and ceremonies of religion, visions, or appearances of the Deity, &c. miracles, and other supernatural things, of which God alone is the author. Such are the book of Genesis, the Gospels, Apocalypse, &c. See Miracles, Prophecy, Revelation, &c.

To this we may refer ecclesiastical history, which gives an account of the rise and establishment of the several religions and churches, of the rise and progress of various opinions, sects, &c. In ancient sacred history, otherwise called the history of the Old Testament, there are seven remarkable periods. The first comprehends 1556 years, from the creation of the world to the deluge; (see Sacred Chronology.) The second period includes 857 years, from the deluge to the going forth of the Israelites out of Egypt. (See Deluge.) The third period begins with the exodus of the Israelites in 2513, extends to the times of the kings, and includes 3962 years. (See Exodus.) The fourth period begins in the year of the world 2909, or from the beginning of the government by kings, and extends to the end of the Babylonian captivity, or 1585th year of the world, including 559 years. (See Captivity.) The fifth period amounts to 372 years, from the year of the world 3468 to the year 3840, or to the times of the Maccabees. (See Maccabees.) The fifth period begins with Judas Maccabaeus, A.M. 3840, and is continued to the year 3964, or to Herod the Great, comprehending 124 years. (See Herod the Great.) The fourth, or last period reaches from Herod the Great to the destruction of Jerusalem, or the 70th year after the birth of Christ, containing 166 years. (See Jerusalem.)

In more modern sacred history, more properly called ecclesiastical history, which denotes a clear and faithful narrations of the transactions, revolutions, and events that relate to the external and internal state of the Christian church, Dr. Mosheim has distinguished four remarkable periods. The first comprehends the state and vicissitudes of the Christian church, from its commencement to the time of Constantine the Great. The second period extends from the reign of Constantine to the...
HISTORY.

that of Charlemagne, which produced such a remarkable change in the face of Europe. The third period contains the history of the church from the time of Charlemagne to the memorable period when Luther rose in Germany to oppose the tyranny of Rome, and to deliver divine truth from the darkenss that covered it. The fourth period reaches from the time of Luther to the present times. On this plan Dr. Molheim's ecclesiastical history, a work devotedly held in great esteem, is divided into four books, containing the history of the centuries comprehended by the above periods according to the order of time. (See Holberg's Introduction to Universal History, translated by Dr. Sharpe, with notes, &c., p. 55, &c. ed. 1758; and Molheim's Ecclesiastical History, translated by Dr. Machine, with notes, &c. compiled in 6 vols. 8vo, vol. i. p. 12.)

This latter is a kind of national history, in which, without stopping at the shell or outside, the appearances of things, differing with the secret springs and movements of the several events; it enters into the thoughts, the breasts of the persons concerned therein; discovers its intentions and views; and, by the result of enterprises and undertakings, discovers the prudence or weakness wherewith they were laid, conducted, &c. Those are much the most useful and entertaining histories. To this class may be particularly referred the Histories and Annals of Tacitus, among the ancients; and those of Guicciardin, Thuanus, and bishop Burnet, among the moderns.

HISTORY, mixed, is that which, besides the ornaments of figured history, calls in the proofs and authorities of simple history, furnishing authentic memoirs, or original letters, manifestoes, declarations, &c. to vouch the truth of what is said. Such are Histories or Collections of Rothwell, Mezeray's History of England, the Genealogical Histories of Ducheine, M. De Marcia's History of Bern, &c.

We shall close this article of History in general, with a brief recapitulation and illustration of the benefits that are likely to result from the diligent study of it; and here we shall avail ourselves of the excellent remarks of Dr. Prieley in his "Lectures on History." The first and lowest use of history is, that it agreeably amuses the imagination, and interests the passions, and, in this view of it, it far surpasses all works of fiction. The latter resemblest those machines that are contrived to illustrate the principles of philosophy, such as globes and orreries, the ues of which extend no farther than the views of human ingenuity; whereas real history resembles the experiments made by the air-pump, the condensing engine, or electrical machine, which exhibit the operations of nature, and the God of nature himself, whose works are the noblest subject of contemplation to the human mind, and are the ground-works and materials of the most extensive and useful theories. Fiction requires a variety of embellishments to excite and interest the passions; whilst the mere thought that we are listening to the voice of truth serves to keep the attention awake through many dry and ill-digested narrations of facts. The next, and higher use of history, is to improve the understanding, and strengthen the judgment, and thus to fit us for entering upon life with advantage. History presents us with the same objects which occur to us in the business of life, and affords similar exercise to our thoughts; so that it may be called anticipated experience. In some respects it will be a better guide to us in the conduct of life than experience: because the examples which it presents to us are generally complete, and we see them through a less partial medium than that of experience. History, therefore, of great importance not only to the advancement of political knowledge, but to that of knowledge in general, because the most exalted understanding is merely a power of drawing conclusions, and forming maxims of conduct from known facts and experiments, of which necessary materials of knowledge the mind itself is wholly barren, and with which it must be furnished by experience. By improving the understanding history frees the mind from many foolish prejudices that tend to mislead it. Such are those prejudices of a national kind, that have induced an unreasonable
unreasonable partiality for our own country; merely as our own country, and as unreasonably to foreign nations and foreign religion, which nothing but the enlarged views resulting from history can cure. It likewise tends to remove those prejudices that may have been entertained in favour of ancients or modern times, by laying open the advantages and disadvantages of mankind in all ages. To an inhabitant of Great Britain it will be one of the greatest advantages resulting from the study of history, that, so far from producing an indifference to his own country, it will dispose him to be satisfied with his own situation, and render him, from rational conviction, and not from blind prejudice, a more zealous friend to the interests of his country. It is from history that all future improvements in the science of government must be derived, and this science, it will be allowed, is of primary importance and interest to those who have sufficient abilities for the study of it, and who are friends of mankind. Another very capital advantage of history is, that it tends to strengthen the sentiments of virtue. It conduces to this purpose by displaying the sentiments and conduct of truly great men, and those of a contrary character, and thus inspiring us with a taste for solid glory and real greatness; whilst it convinces us that these qualities do not consist in the attainments which mankind are too generally pursuing. That true greatness does not consist in riches may be evinced by the examples of Cincinnatus, Fabricius, Scipio Africanus, and other Romans in the early ages of their city, who were honoured for their poverty. The emperors Nerva, Trajan, Antoninus, and Aurelius, fold their palaces, their gold and silver plate, their valuable furniture, and other superfluities heaped up by their predeceivers, and banished from their tables all expensive delicacies. These princes, together with Vespasian, Pertinax, Alexander Severus, Claudius the second, and Taticus, who were raised to the empire by their merit, and whom all ages have admired as the greatest and the belt of princes, were always fond of the greatest plainness in their apparel, furniture, and outward appearance. When the famous Cornelis, daughter of the great Scipio, was importuned by a lady of her acquaintance to shew her toilette, she deferred satisfying her curiosity till her children, who were the famous Gracchi, came from school, and then said "En! here ornamenta mea sunt." "These are my ornaments." Can we think that honours and preferences constitute true greatness, when history teaches us that the most worthy men have generally declined them? On the other hand, the extravagances of Alexander the Great in killing his best friends, the cruelties of the Spaniards in America, the ruin of Sweden by Charles XIII. are certainly more proper to shew the folly and madness of unhallowed ambition, than their victories are to dazzle our minds with their glare. Nothing so effectually cures a man of the absurd pride of birth and family, as seeing some of the greatest men in history, such as Tamerlane, cardinal Ximenes, and pope Sixtus V. rise from low beginnings. Even Vespasian laughed at those who pretended to derive his descent from Hercules. An excessive passion for fame, as an end of action, reduces a man very low in the light of history. On the contrary, how prodigiously does the character of Cato rise upon us by a few words of Sulkiut: "Maluit aëre, quam videri, bonus?" He rather chose to live, than to be seen, good. The vanity of Nero upon his excelling in music, and gymnastic exercises, and that of Commodus on his dexterity in killing wild beasts, completely expose the affectation of gaining eminence in what is out of our proper sphere. The same maxim is conveyed by Philip, when he asked his son Alexander, if he was not ashamed to play on a musical instrument so well as he did. A simple narration of some historical incidents excites an admiration of true greatnes of mind more than the most elaborate description of it. What can give us a clearer idea of the noble sentiments of strict honour and integrity, than Marshal Turenne's refusing a sum of money, which was offered him, as not matching with his character? He had not intended to match that way! Does not every person's heart strongly feel the sentiments of benevolence, when he hears the good Titus exclaiming, that he had "left a day," because he had done no person a good office in it? If a person be capable of forming any idea of greatnes of mind in forgiving injuries, he will do it from hearing the following reply made by Lewis XII. to a courter, who preffed him to punish a person who had offended him before he came to the throne; "It belongs not to the king of France to revenge the injuries offered to the duke of Orleans?" Or, what can give so just an idea of the true spirit and magnanimity of a foolish, as the reply that vincible Dorde made to Charles IX. of France, when he received an order from him to murther the Huguenots? "I desire your majesty would employ me in what is possible." This example suggests also, that history enables us to form just ideas of the dignity and the weaknesses of human nature, both of which are extremely useful to us in life. When the earl of Peterborough, at the siege of Barcelona, was settling the terms of capitulation with the Spanish commander, news was brought him that, contrary to the suspension of arms stipulated between them, a party of the allied troops had broken into the town. The earl, with a noble spirit of true honour and heroism, told the Spanish general, that if he would give him leave to enter the town with his English troops, he would drive out his allies, and then return to finish the capitulation, which he actually performed. Without mentioning the fabulous flores of Curius, who is said to have leaped into a gulf, or of Codrus, who procured his own death to save his country, we may observe, that at the siege of Turin one Mica fired a mine, and purportly destroyed himself with the enemy. And how many commanders of ships have blown them up rather than strike their colours! Such facts, together with those which manifest the extent of genius, in men like Arifotol, Archimedes, and sir Isaac Newton, give us high ideas of the dignity of human nature, and the capacity of the human mind. History also, with equal fidelity, gives us a most affecting, and equally instructive view of our deplorable weaknesses and frailty, exemplified in the occasional conduct of the greatest of men. What grots and humiliating superfluous have been manifested by men, in other respects, of sound and clear understandings, and of upright honest hearts! Pascal, one of the greatest geniuses and best men that ever lived, entertained a notion, that God made men miserable here in order to their being happy hereafter; and in consequence of this notion, he imposed upon himself the most painful mortification. He even ordered a wall to be built before a window in his study, which afforded him too agreeable a prospect. He also had a girdle full of sharp points next his skin, and while he was eating or drinking anything that was grateful to his palate, he was constantly prickling himself, that he might not be sensible of any pleasure. It was through a similar weakness that the excellent Fenelon submitted without reserve to the arbitrary sentence of the pope, when he condemned a book which he had published, and even preached in condemnation of his own book, forbidding his friends to defend it. (See the articles Fenelon and Pascal.) Moreover, history tends to strengthen the sentiments of virtue, by the variety of views in which it exhibits the conduct of divine providence, and points out the hand of God in the affairs of men. N. For
For whatever fuggles to us the idea of a divine being, either in the end, or means, of great events, must be favourable to piety and virtue. We could not but feel a deep conviction that the view which Henry VIII. had to be divorced from his wife would have brought about the reformation in England? The indiguration of a Portuguese priest, who would not give place to one of the king's officers in Japan, and the obstinacy of the Jesuits, in refusing to give up the house which a nobleman had given them, when his son claimed it hack again, occasioned the extirpation of the Roman Catholic religion in that country. The history of Joseph, that of Esther and Mordecai, and many others that are recorded in the instructive pages of the Old Testament, supply facts to the same purposes. Great events, under the conduct of providence, are brought about contrary to the intention of the persons who were the chief instruments of them, and by the means which were intended to produce a contrary event. Thus perfecution has been always the means of promoting the perfected religion; and thus the well-known adage has been verified: "The blood of the martyrs is the seed of the church." Thus, likewise, Athens, Lacedemon, Carthage, Rome, and many other states, have been ruined by their own successes. Philip II. of Spain, by his intolerable oppression, was the cause of the freedom of the states of Holland. A regard to divine providence is also extremely useful to heighten our satisfaction in reading history, and throw an agreeable light upon the most gloomy and disgusting parts of it. Moreover, history, in the midst of its disasters, in which the most distinguished personages have been reduced, gives us a deep conviction of the infallibility of all human things, and prepares our minds to submit to adversity with more patience and resignation, as to a condition from which we see none are exempt. What other sensations do we feel, while we read that Henrietta, daughter of Henry IV. of France, and wife to Charles I. of England, was reduced to the utmost poverty; and that her daughter, afterwards married to a brother of Lewis XIV. is said to have lain in bed for want of coals to keep her warm, while the people of Paris, blind with rage, paid no attention to her sufferings! Similar sensations are felt, when we read the history of Befarius, the great and successful general, who is said to have begged his bread, and of Cortez, the renowned conqueror of Mexico, who lived unknown and despised in Spain, though he was the king of Mexico; and of that was so clamorous to speak to him, he cried out, "I am one who have got your majesty more provinces than your father left you towns." Belides, the reverses of fortune, and calamities of men in high situations, should dispose those who have no opportunity of rising above them, to be content with their situation. The many who have abdicated royalty, as Christilla, queen of Sweden, Charles V. emperor of Germany, Victor Amadeus, king of Sardinia, John Calvin, king of Poland, and others, convince us that crowns do not always fit easy; and that persons in high situations have need of a strong sense of honour and integrity to make their fortunes and misfortunes tolerable. In many instances they are objects, not of envy, but of commiseration; and they claim the exercise of a candid judgment. The examples of distinguished personages are apt to make a deeper impression on the mind than those of persons subject to vicissitude, in the humbler stations of life. The insufficiency of power and riches to bound men's views and to make them happy, is evinced in a thousand instances of almost daily occurrence; but the sentiment makes a deeper impression when we see it exemplified in the history of statesmen and conquerors. It is beautifully exhibited in a conversation which passed between Pyrrhus and his minister Cymess, before their expedition into Italy. The minister asked the king what he wished to do when he had subdued the Romans? He answered, pass into Sicily. What then? said the minister. Conquer the Carthaginians, replied the king. And what follows that? says the minister. Be sovereign of Greece, and then enjoy ourselves, said the king. And why, replied the sensible minister, can we not do this left now?

Besides the benefits resulting from the study of history, above briefly recited and illustrated, there are other advantages accruing to mankind from it, in a different manner, as only one instrument of recording transactions. How imperfect, e.g. without history, would our knowledge of genealogies, and consequently of the order of important occurrences, and how precarious would be the advantage, resulting from conventions and treaties of all kinds, if all the articles of them were repotted only in the memory of the contracting parties. We read that the boundaries of the Greek states were once determined by a veris of Homer, who, in his description of Greece, relates what they were in his time.

If history be of such distinguished use, we may easily answer a question that has been sometimes proposed; viz. at what age it is proper to be read. We need not hesitate in pronouncing, that it can neither be begun too early, nor continued too late. "If history amuse the imagination, exercise, improve the passions, inspire a taste for truth, glorify our sentiments, and, a love for, virtue, and thereby form the temper, and prepare man for conversing with the world; what can be more proper for young persons? And since the mind cannot be too well furnished in these respects, and men cannot have too large a stock of this anticipated experience, the study of it must be useful, while there remains any thing of the part we have to act on the theatre of the world. Moreover, since history furnishes materials for the finest speculations, and the most important sciences, it cannot but be of service while we make any use of our intellectual faculties." Prudence will direct those who have the conduct of the studies of young persons to make a proper selection. Histories, which tend chiefly to amuse the imagination, or enforce the plainest instructions in morals, ought rather to be recommended to persons in early life; and histories which furnish greater exercise for the judgment should be reserved for an age in which the judgment is ripened.

However, there can be no greater inconvenience in young persons being involved in reading almost all histories promiscuously. No general history is better calculated for the use of such than that of R. Illin.

As to the advantages that result from the study of ecclesiastical history, they are general or particular. In a general view of them, the history of the church presents to our view a variety of objects that are every way adapted to confirm our faith. When we contemplate, by the aid of it, the discouraging obstacles, the united efforts of kingdoms and empires, and the dreadful calamities which Christianity, in its very infancy, was obliged to encounter, and over which it gained an immortal victory, this will be sufficient to fortify its true and zealous professo against all the threats, cavils, and arguments of profane and impious men; the great and shining examples, also, which display their luster, more or less, in every period of the Christian history, must have an admirable tendency to inflame our piety, and to excite, even in the coldest and most infensible hearts, the love of God and virtue. Tho' these amazing revolutions and events that distinguished every age of the church, and often seemed to arise from small beginnings and causes of little consequence, proclaim, with a solemn and respectable voice, the empire of providence,
HIT, in Geography, a name with hatchel.

HITCHER, in Neutlich Affairs, is a pole, armed with an iron point and hook, which is used on board of barges or boats for either pulling or shoving them to or off each other, or a wharf, ship, &c. On most canals pointed hitchers are prohibited to the boatmen, on account of the damage they do to the lining of punts in the bottom of the canal to retain its water, as mentioned in our article, Canal.

HITCHIN, in Geography, a large and ancient market-town and parish in the hundred of Hitchin and Pirton, Hertfordshire, England, is situated in a fertile valley, and surrounded by considerable eminences. It appears to have had its origin in the Saxon times, and was granted by Edward the Confessor to earl Harold, by the appellation Hitchin. In the Doomsday book it is called Hiz, a name that, according to Chauncy, it received from the little river Hiz, which flows through it. At the period of making that survey it belonged to the king, and was rated at five hides; two of which are described as lying "in monasterii hujus villa." Hitchin church is a handsome edifice of stone, occupying the site of a more ancient fabric near the centre of the town, and apparently of the age of Henry VI. or Edward IV. The interior is spacious, and consists of a nave, chancels, and side aisles; its length is upwards of 150 feet; its breadth 67. The episcopal monuments are very numerous. An inscription for Sir Robert de Kedendale, knight, and three effigies greatly mutilated, which are now placed under windows of the north aisle, are of more ancient date than the present structure. The first or most westward of these effigies represents a knight cross-legged, in chain armour; and was probably desiguated for one of the Batiols, who were lords of this manor during the 12th and 13th centuries. The other two figures are the effigies of Sir Edward de Kendale, knight, lord of Hitchin, and his lady, who both died towards the end of the reign of Edward III. Some very fine brasses, of the 15th and 16th centuries, occur in different parts of the church, and the windows contain much painted glass. At a short distance south-east of the church was formerly the priory of Biggin, founded for nuns of the Gilbertine order; but at what period is uncertain. The site is now occupied by the school-house, and the appendant-ellate is vaulted in trullies for charitable uses. Hitchin priory was founded for white Carmelites in the time of Edward II.; very few traces of it remain; on the immediate site is now a family mansion. The market at Hitchin, held on Tuesdays, has existed from an early period, and very large quantities of wheat and other grain are sold in it; probably in some degree from being free of toll, by preceptive right. Two fairs are held annually for the sale of cattle, sheep, &c. Formerly the wool trade was very flourishing here; this town having became the residence of many merchants on the removal of the staple from Calais by Edward III. The town is divided into three wards, viz. Bancroft, Bridge, and Tilehouse wards, and is governed by a bailiff, four constables, and two headboroughs for each ward. Among numerous charitable donations in this parish are none of John Skynner, gent., who, in the year 1668, bequeathed 300l. to build almshouses; 300l. to purchase lands for their endowment; 100l. to apprentice poor children; and 100l. towards the further endowment of the free-school. Hitchin is 13 miles distant from London; and, according to the returns under the population act of 1811, contained 674 houses (mostly irregular buildings),

HITCHING, in Dorfemannship, is to wriggle or move forwards by degrees, or to knock the legs together in walking. Hité, in Geography, is by varying form from Charles.

HITZUCKERS, a town of the principality of Luneberg-Zelle, situated on an island in the jetze; 29 miles E. of Luneburg. N lat. 53° 17'. E. long. 14° 12'.

HITTERO, or Hitteren, an island in the Northern ocean, near the coast of Norway. N lat. 63° 32'. E. long. 8° 20'.

HIU, a city of China, of the second rank, in the province of Honan. N. lat. 34° 5'. E. long. 113° 35'.

HIVE, in Rural Economy, the name of a well known repository for bees. Bee-hives, in different places, and in different occasions, are of very different materials. In some places the hollow trunk of a tree serves the purpose; in others they are made of four boards nailed together in the shape of a long box, and placed with one end upon the ground, or upon a frame of wood-work erected for that purpose. The most usual form of them, however, is conic and bell-fashioned; and the common materials of which they are made are twisted oifer or straw, nicely matted together, and made into a sort of thick cords, bound round with oifer-bark. The lath is the most common kind, and serves perfectly well for all the purposes of the bees, and of the persons who make their profits of the honey. The lath is sufficiently warm and close for the bees, and a thin frame of boards defends it from being injured by the wet. But perfous of speculative dispositions have at all times been detractors of heating what paffed in the hive, and of observing the habits of the bees in their work; for this purpose the ancients contrived a method of placing certain squares or panes of a transparent matter, such as horn, or the lapis specularis, or tinglafs, in some parts of the sides of the hive, through which they might see all that paffed within. This is mentioned by Aristotle, Pliny, and others; but it foon funk into difufe, and is later ages it has been fuppofted to be an idle attempt. Moufet in particular ridicules it, and says, that the bees within would immediately spoil the transparency of any materials thus employed.

This practice of the ancients seems to have been first revived in our country by Mr. Jeddle, who, in the year 1665, published his invention of boxes for preferring the lives of bees, and obtained a patent from King Charles. These were improved by Joseph Ward, physician at Croydon, who enriched his account of the structure and use of these boxes, with several other curious circumstances concerning bees, in his work entitled "The true Amazons, or the Monarchy by Bees." But this method was far from being generally known in the year 1680, since Swammerdam seems to have been altogether unacquainted with it; and to this we are to impute the imperfections of that author's account of bees, because, though a most accurate and faithful writer, he had no opportunities of seeing what has been since discovered with this advantage.

Of late, however, this invention has been commonly practiced. A transparent sort of bee-lave may easily be made, by leaving certain squares in a wooden hive open, and afterwards filling clear glafts in these vacant spaces; a frame of wood may cover the whole, so that the light is not always let in upon the bees, and the covering may be removed when the observer is to examine their operations. By this means it is found, that the squares of glafts, when properly placed, will keep clean and trans-parent for many years; and when they are fullled, there are easy methods of cleaning them, by taking them out and replacing them when they have been used. When the observer places himself behind the hive, and has one or two squares of glafts before his eye, he sees exactly, all that passes within, without incommoding or interrupting the creatures at their work. These glafts hives, however, are chiefly objects of curiosity, though, in some instances, they have led to discoveries that must gradually contribute to the improvement of the economy of these useful insects.

The principal advantage derived from hives of modern construction, is that of obtaining the honey and wax without recurring to the barbarous expedient of destroying the bees. In the common method, a hole is dug near the hive, (generally in the month of September,) and a stick, at the end of which is a rag that has been dipped in melted brimstone, is fixed in the hole; and, when the rag is set on fire, the hive is immediately put over it, and the earth thrown upon, so that none of the smoke can escape; and thus the bees are inhumanly and needlessly destroyed. The heaviest and lightest hives are treated in this manner; the farmer, because they yield the greatest profit, with an immediate return; and the latter, because the bees in them would not be able to sur vive the winter. Those hives which weigh from fifteen to twenty pounds are thought to be the fittest for keeping. The method of preferring the lives of bees has been brought to a considerable degree of perfection by the late Mr. Thorley of Oxfordshire, and Mr. White of Suffolk. Mr. Thorley, who takes the lead in this improvement, prefers colonies to hives for the following reasons: 1. The more certain preservation of many thousands of these useful insects. 2. Their greater strength, confiding in their number, and their corresponding security from robbers. 3. Their greater wealth, arising from their united labours. To this purpose he tells us, that he has, in some summers, taken two boxes filled with honey (most of it being pure virgin honey of the bell kind) from one colony, and left sufficient flare for their maintenance; add to these advantages, the pleasure of viewing them, with the greatest safety, at all seasons, even in their buffett time of gathering, and their requiring much less attendance in swarming time. The bees thus managed are also more effectually secured from wet and cold, from mice, and other injuries.

Mr. Thorley's boxes are made of deal, which, being spongy, fucks up the breath of the bees sooner than a more solid wood would do; and yellow dram-deal, thoroughly feathered, he says, is the best.

The best form of these boxes is an octagon, which, being nearer to a sphere, allows the bees in winter to lie, in a round body near the centre of the hive; and thus a due heat is conveyed to all the exterior parts, and the honey is kept from candying. The dimensions, which he recommends, after long trial, are ten inches deep in the inside, the top-board a full inch, and the breadth within twelve or fourteen inches. He has tried boxes containing a butterl or more, but found them not to answer the design like those of a less size. The top of the box should be made of an entire board, or of two boards well glued together, which should be a full inch thick after it has been planed, and project on all sides at least an inch beyond the dimensions of the box. In the middle of this top there must be a hole five inches square, for a communication between the boxes; and this hole should be covered with a sliding shudder of deal or elm, running easily
easily in a groove, over the back-window. The eight
pannels, nine inches deep, and three quarters of an inch
thick when placed, are to be let into the top, so as to
keep them in their proper places; to be secured at the
corners with plates of brass, and to be camed with
wires at the bottom, in order to keep them firm. There
should be a glass window below, fixed in a frame, with
a thin deal cover, two small brass hinges, and a button
to fasten it: this window will serve for inspecting the
state and operations of the bees. Two brass handles,
one on each side, are necessary to lift up the box; the
should be fixed in with two thin plates of iron, near three
inches long, so as to turn up and down with the box,
and put in three inches below the top-board, which is
raised down close with springs to the other parts of the
box. Those who choose a frame within, to which the
bees may fasten their combs, need only use a couple of
deal ficks of an inch square, placed across in the box,
and supported by two pins of brass; one an inch and a
half below the top, the other two inches below it; by
which means the combs will quickly find a stay. There
must also be a passage, four or five inches long, and less
than half an inch deep, for the bees to go in and out at
the bottom of the box.

The boxes, thus prepared, should be kept in a house, or
under a shed, the disposition and structure of which Mr.
Thorley has particularly described. He also recommends
to paint the apertures of the boxes, which are the habitations
of the several colonies, with different colours, as red,
white, blue, yellow, &c, in form of a half-moon or square,
that the bees may better know their own home. For
the method of furnishing these colonies with inhabitants, see
Hiving.

Mr. Thorley, fon to the above-mentioned gentleman, has,
by long experience, improved his father's method of managing
bees. The bee-hive of his construction, presented to
the Society of Arts, &c is exhibited in Plate XX, Mis-
cellany, fig. 1.

The bottom part, marked a, is an octagonal bee-box,
made of deal-boards, about an inch in thickness, the cover
of which is externally 17 inches in diameter, but internally
only 15 1/2, and its height 10 inches. In the middle of the
cover of this octagonal box is a hole, which may be opened
or shut at pleasure, by means of a slider d. In one of the
pannels is a pane of glasses, covered with a wooden door e.
The passage f, at the bottom of the box, is about three
and a half inches broad, and half an inch high. Two slips
deal about half an inch square, cross each other in the
centre of the box, and are fastened to the panel by means of
small screws: to these slips the bees fasten their combs.
In this octagonal box the bees are hived, after swarming
in the usual manner, and there sufficed to continue till
they have built their combs and filled them with honey;
which may be known by opening the door, and viewing
their works through the glass pane, or by the weight of the
hives.

When the bee-mater finds his laborious infants have filled
their habitation, he is to place a common bee-hive of straw,
represented at k, made either flat at the top, or in the com-
mon form, on the octagonal box, and drawing out the slider,
a communication will be opened between the box and the
hives; in consequence of which the bees will fill this
hive also with the product of their labours.

When the hive is well filled, the slider may be pushed
in, and the hive taken away, and another placed in its room,
with the slider drawn out. This new hive will also be filled
in the same manner.

By proceeding in this method, Mr. Thorley assured the
society, that he had taken three successive hives filled with
honey and wax, from a single hive, during the same sum-
mer, and that the food still remaining in the octagonal box
was sufficient for the support of the bees during the winter.
He adds, that if this method was pursued in every part of
the kingdom, instead of the cruel method of destroying these
useful insects, he is persuaded, from long experience, that
wax would be collected in such plenty, that candles made
with it might be sold as cheap as those of tallow are sold at
profit.

Mr. Thorley has also added another part to his bee-hive,
which cannot fail of affording the highest entertainment to
a curious and inquisitive mind. This part consists of a glass
receiver, 18 inches high, eight inches in diameter at the
bottom, and in the greateall part 1½; this receiver has a hole at
the top, about an inch in diameter, through which a square
piece of deal is extended nearly to the bottom of the vessel,
having two cross-bars, to which the bees fasten their combs.
Into the other end of this square piece is screwed a piece of
brass, which serves for a handle to the receiver or glasses hire.
When the bees have filled their straw hive, which must have
a hole in the centre covered with a piece of tin, Mr. Thorley
places the glasses receiver upon the top of the straw hive, and
draws out the piece of tin. The bees, now finding their habitations
enlarged, pursue their labours with such alacrity, that
they fill this glass hive likewise with their flowers; and as this
receptacle is wholly transparent, the curious observer may
amuse himself with viewing the whole progress of their works.
It will, however, be necessary to cover the glasses with an
empty hive of straw, or at least with a cloth, which may be
easily removed when the bees are inspected, left too much
light prevent their working. In this way Mr. Thorley, in a
good season, has had a glass filled in thirty days, containing
38 pounds of fine honey.

When the glass is completely filled, slide a tin plate
between the glasses and the hive or box, so as to cover the
passage, and in half an hour the glasses may be taken away
with safety. The few bees that remain will readily go to their
companions.

Mr. Thorley has added a glass window to his straw hives,
in order to observe the progress of the bees; and this
trivance is useful, especially if one hive is to be removed
whilst the season continues favourable for their collecting
of honey; for when the combs are filled with honey, the cells
are sealed up, and the bees forlarke them, and refuse mostly
in the hives in which their works are chiefly carried on.
Observing also, that the bees were apt to extend their combs
through the passage of communication into the upper hive,
which rendered it necessary to divide the comb when the
upper hive was taken away, he puts in that passage a wire
screen for netting, the meshes of which are large enough for
a loaded bee to pass easily through them; and thus he
prevents the junction of the combs from one box to the other,
and consequently obviates the necessity of cutting them,
and of spilling some honey, which running down among a crowd
of bees, incommoded them much.

Mr. White, in his directions for making the bee-boxes of
his invention, tells us, speaking of the construction of a single
box, that it may be made of deal or any other well-seasoned
boards, which are not apt to warp or split. The boards
should be near an inch thick; the figure of the box figures,
and its height and breadth nine inches and five-eights every
way, measuring within. A box of these dimensions will con-
tain near a peck and a half. The front part must have a door
cut in the middle of the bottom edge, three inches wide, and
near half an inch high. In the back part a hole must be cut

with
with a rabbit in it, in which is to be fixed with putty a piece of the clearest and bell crown glass, about five inches long, and three broad; and let the top of the glass be placed as high as the roof within, that the upper part of the roof may be seen from the frame, and the strength of the bees may be judged better of than if the glass were fixed in the middle.

The glass must be covered with a thin piece of board, as a shutter, which may be made to hang by a string, or turn upon a nail, or slide sideways between two mouldings. The glass may be made large, or another pane of glass may be fixed on the top and covered with a shutter, for the convenience of observing the bees at their work. The side of the box, which is to be joined to another box of the same form and dimensions, as it will not be exposed to the external air, may be made of a piece of slit deal not half an inch thick. This Mr. White calls the side of communication, because it is not to be wholly inclosed: a space is to be left or cut at the bottom through the whole breadth of the box, and a little more than an inch in height, and a hole or passage is to be made at the top, three inches long, and more than half an inch wide. Through these the bees are to have a communication from one box to another. In the next place a loose board is to be provided, which board is to be half an inch thick, and large enough to cover the side of communication; and likewise several little iron flaps, an inch and a half long, with the two points or ends bending down more than half an inch: the use of this part of the apparatus will appear under the article Hiving. Moreover, let two licks be fixed in the box transversely and crossing each other, in order to be a flap to the combs; one about three inches from the bottom, and the other at the same distance from the top; and when the hole is painted, in order to render it more durable, the box is finished. This box, says the inventor, is as plain as possible: it is little more than five square pieces of board nailed together, so that any poor cottager may make his own boxes, without the help or expense of a carpenter.

The other box must be exactly of the same form and dimensions; and the two boxes differ only in this, that the side of communication of the one must be on the right hand, and of the other on the left. The two boxes, with their openings of communication ready to be joined, are represented in Plate XX. Misedelings, fig. 2.

In fig. 5, is exhibited the front of a frame for twelve colonies; a, a, are two fills of oak, lying flat on the ground, more than four feet long; in these fills are fixed four upper poits, about the thickness of such as are used for drying linen. The two poits b, b, in the front, are about six feet two inches above the fills; the other two, standing backward, five feet eight inches. You are next to nail some boards of slit deal horizontally from one of the fore-poits to the other, in order to screen the bees from the sun: let these boards be seven feet seven inches in length, and nailed to the inside of the poits, and be well-seaoned, that they may not shrink or split in the joints: c, e, are two filpins of deal, to keep the boards even, and to strengthen them.

Fig. 4 represents the back of the frame: d, d, d, are four strong boards of the same length with the frame, on which the boxes are to be placed; let the upper side of them be very smooth and even, so that the boxes may stand true upon them, or it may be more advisable to place under every pair of boxes a smooth thin board, as long as the boxes, and about a quarter of an inch wider. The bees will soon fill the boxes to this board in such a manner, that you may move or weigh the boxes and board together, without breaking the wax or rim, which, for many reasons, ought to be avoided.

These floors must be supported by pieces of wood or bearers, e, e, &c., which are nailed from post to post at each end; they are likewise well nailed to the frame, to keep the frame from sinking with the weight of the boxes: f represents the roof, which projects backwards about seven or eight inches beyond the boxes, to shelter them from the rain.

You have now only to cut nitches or holes i the frame over-against every entrance into the boxes, as h, h, h, fig. 3; let these nitches be near four inches long, and under each nitch a small piece of wood for the bees to light upon. The morning or evening fun will shine upon one or both ends of the frame, let its aspect be what it will; but you may prevent its over-heating the boxes, by a loose board set up between the poits, and kept in by two or three pegs.

In order to take away part of the honey, without destroying much disturbing the bees, Mr. White advises to examine the state of the colonies about the latter end of August through the glaffes; and he observes, that such as have filled a box and a half with their works may spare the half box; but the honey-comb should be particularly examined, and about eight or nine pounds left for their winter store. When this is done, open the mouth of the box you intend to take; then, with a thin knife, cut through the resin with which the bees have joined the boxes to each other, till they are separated; and, after this, thrust a fleet of tin gently between the boxes. The communication being thus stopped, the bees in the fullest box, where must probably the queen is, will be a little disturbed; but those in the other box, where there is no queen, will be in the utmost confusion, running to and fro with a kind of mournful cry, and influing out at the newly opened door in great disorder; however, when they have got abroad, and dote over their companions, they eagerly join them at the mouth of the other box. By this means, in an hour or two, you will have a box of pure honey, without a living bee to molest you, or any dead bees to waive or damage the honey.

Mr. White's boxes are convenient for feeding poor flocks, in order to preserve them, and also for removing moths and insects from any colony that is in danger of being injured by them.

Mr. Wildman recommends the following method of taking the wax and honey, without destroying the bees: remove the hive, from which you would take the wax and honey, into a room, into which little light is admitted: invert the hive gently, placing it on any support, and cover it with an empty hive, keeping the side next the window of the empty hive raised a little, to give the bees sufficient light to find their way into it; while you hold the empty hive steadily supported on the edge of the full hive, between your side and your left arm, keep flirking with your hand all round the full hive from top to bottom, in the manner of beating a drum, so that the bees may be frightened by the noise, and mount out of the full hive into the empty one. As soon as all the bees are out of the full hive, which will generally be in about five minutes, the other hive, in which they are collected, must then be placed on the floor from which the full hive was taken, in order to receive the absent bees as they return from the fields.

If this be done early in the season, the operator should examine the royal cells; for if any of them contain young bees, they, as well as all the combs that have young bees in them, must be preserved in the hive. Take out the other combs with a long, broad, and pliable knife, cutting them from the sides and crown as clear as possible, to prevent the future labour of the bees, who must lick up all the honey spilt, and remove every grain of wax. The sides of the hive should
HIVE.

should then be scraped with a table spoon, to clear away what was left by the knife.

Having thus taken the wax and honey, let a table, covered with a clean cloth, be placed near the land, and giving the live, in which the bees are, a sudden shake, striking at the same time with a considerable degree of force, the bees will be shaken on the cloth. Put their own hive upon them immediately, raised a little on one side, that the bees may the more easily enter; and when all are entered, place it on the stand as before. If the hive in which the bees are be turned uppermost, and their own hive placed over it, the bees will immediately ascend into it, especially if the lower side be struck to harm them; for the effects of fear, if pressed on the bees by the continual noise, renders them, for a considerable time, so timid and tractable, that they will bear any handling, which does not hurt them, without any signs of resentment.

Mr. Thorley objects to the method of driving bees, in order to obtain their honey, because the honey will be foul and corrupted, and great numbers of the young brood will thus be utterly destroyed, and the flocks much reduced and endangered.

Mr. Ifac, secretary to the Apriarian Society in the west of England, has published a small treatise, entitled "The General Apriarian," in which, among other things, he has described the structure of two hives, one called the "Moreton-Hive," and the other the "Cottage Hive." The former is intended for a house or shed, and the latter for the open garden. The Moreton-hive is made of reed, fitted with the splits of willow or bramble; it is of a cylindrical form, twelve inches clear in diameter, and six inches high; it is held upon a narrow hoop with whistle bit-holes in it to receive the stitches of the first lift or round of reed, and a mortise-hole in the fore-part for entrance, 3/4 inch in horizontal length by 1/2 inch in perpendicular height; this entrance should be near 2/4 inch above the lower edge of the hoop, which edge should be so planed as in every part to touch a plain board. The hive, thus contrived, should be laid upon a level board, with another board upon it, which should be so thick as not to bend under a weight of 50 pounds, which should remain upon it for a day or two, till it is fettled in a clofe flate. When the hive is taken off, two of the middle lifts should be cut opposite to the entrance for receiving a pane of glass, near three inches long, and as wide as the part of the two lifts taken out. The ends of the lifts, or coils, should be secured by stitches made with softened mole-flap wire. When the glass is fastened with putty, the stitches of the hoop should be filled with the same; and then a small flick should be made to pass in through the middle lift from right to left, and out at the other side of the hive to serve as a support for the combs. This hive should have a set of bars cut in a round deal board, 14 inches in diameter, and 1/4 inch thick, nearly rounded to fit the hive. Of these bars there are fix, and their width is 1/16 of an inch. The openings between them, called "frets," must be 1/4 of an inch wide, and extend to within an inch of the circumference of the board, by which these openings is converted into bars to support the combs. Across these bars, on the under side, it may be right to spring a small slat of wood, to keep them from dividing farther, in case the circumference should split at any time. The bars must be fastened on the top of the hive with deal pins, entering through the first into the second or third lift; then a round flat top of reed, 14 inches in diameter, must be fastened to them: in this cover, and near the front of the hive, the curious may have a hole made, five inches in diameter, covered by a small board, which may be turned off at pleasure, for placing over the hole a bell-glas, in which the bees may, in a good summer, be tempted to work. For a good swarm there should also be provided two other hives, with bars of the same form; but without a top. On the bars of one of them the first hive should be placed, with the glass or windows, entrances and bars, perpendicularly over each other. There should also be four hoops, of mole-flap wire, fastened about nine inches afunder, in one of the lifts of the under hive, through which to pass a cord over the top hive, to keep both firmly together till the swarm is hived and placed in the bee-house. It is the cord that must keep them together. When the bees have filled the front and second, let them be raised on the third.

The "Cottage-hive" is composed of two parts; the higher part is like the common hives, but somewhat less in dimensions; 11/2 inches within, from the centre of the crown to the edges; the diameter at the edges is 13 inches; the entrance is horizontally two inches long, and 2/4 of an inch high; opposite to the entrance, three lifts above the edge or firk is a pane of glass, like that in the Moreton-hive, and across the line of vision from the glass to the entrance, a fick is passed in at the right and out at the left. The other part is the fecton of a cone, 13 inches diameter in the clear, at the higher edge, and 11/2 inches at the lower edge, or mouth, which is formed by a hoop, like the Moreton-hive, with the first lift sewed in the holes of it with willow or bramble split. Over the entrance is a piece of flapped deal, tacked to the hoop and front of the hive, to make it fit the front of the shed, or bee-house; but this piece should not be united to it when it is to stand in the garden. Opposite to the entrance is the window for inspection. But this part, called a "transit," because it serves as a passage between a common hive and one of Wildman's hives, wants no cross-flick to strengthen the combs, as it is two inches wider at the higher than it is at the lower edge or bottom. On the higher edge of the transit there must be fixed bars, made of a round deal board, 1/4 inch thick, and 13 inches in diameter. The bars are 6, 13 inch wide, the frets are five, half an inch wide, and there are two outside frets 3/8 of an inch wide, or rather more. The transit, when the bars are fixed, should be divided by the weight of half a hundred, on a frame of strong board; for a day or two, to settle it. The perpendicular height of the transit is 18 inches; and it will hold as many as the Moreton-hive. The two parts of the cottage-hive must be falled together, like the first and second Moreton-hives, to receive the bees; and when the second parts are united, it will hold nearly seven gallons. This is called the cottage-hive, because it is the cheapest ever seen by the inventor, as it is of sufficient dimensions for the large swarm, will admit of being easily divided and deprived, and may be reduced to accommodate a small or poor flock, by taking off the under part against winter; and by means of a good cap, hoop, and cord, it may be inclosed on an open fland, firmly fixed on the ground, against all the common affults of wind and weather. Its form, being nearly that of an egg, with a part of the small end cut off, is more friendly to the bees, in respect to warmth in winter, and, therefore, better calculated for breeding in the spring than any other. It possesses all the advantages, without the inconveniences, of the large hive, recommended by the ingenious Mr. Butler, the father of the English Apriarians.

See on the subject of this article, Thorley's Inquiry into the Nature, Order, and Government of Bees, 1774; White's Collateral Bee-Boxes; Wildman, &c. on Bees; Key's Ancient Bee-Master's Farewell, 1795; Ifac's General Apriarian, 1803. See Bee.
Hiving. 

Hive, def. a name sometimes given to crude or rough wax. See Wax.

HIVING, the placing of a swarm of bees in a hive, in order to have the profit of their labours. When the swarm of bees has left an old hive, and is placed in form of a cluster hanging down from the branch of some shrub or low bush, the hiving is extremely easy, and may be done in half an hour after the time of their being full and calm in the cluster; or it may be let alone till an hour or two before sunset, provided that the sun do not shine too vehemently upon the place where they are, for that would disquiet them, and force them to rile; and, in that case they usually take a long flight before they settle again, and are very often lost; this, however, may at any time be prevented by placing an artificial screen before them, composed either of coarse cloth, or of a few branches of trees well covered with leaves.

It is commonly the branch of some shrub or tree that they settle upon, and we always find that they mean this as their settled habitation; for, however soon they are hived, the rudiments and beginnings of combs are found on it. It is true, they always leave these places, if left to themselves, in five or six days; but this is not till they find them so inconvenient that they cannot keep them, either from their being too much scorched by the sun, or exposed to winds and rain. The quantity of wax and honey left in these places, when they have quitted them, abundantly proves, however, that they had meant them for their fixed abode.

When they are placed in a hive, they very soon find themselves much better lodged than in the place they had provided for themselves; and they usually stay in it, and begin to work the next morning.

It might appear a very difficult task to get so large a number of bees into a hive, but it is much less so than it appears to be. They will often take possession of the hive of their own accord when it is hung over them; but the shortest way is to hold the hive under the branch where they are, and then sweep them down into it. This may be done with a branch of a tree with its leaves on it, or with the hand armed with a strong glove, and the face covered. But there are country fellows who will go without any sort of defence, and with their naked hand sweep them carefully off the bough into the hive, which they hold in the other hand underneath.

It is not to be expected that the whole swarm will be thus swept peaceably into the hive; many will fly away, and many clusters will fall beside the hive to the ground. All this, however, creates no difficulty; for the hive being turned bottom upwards, and set on the ground near the tree, with its edges a little raised above the surface, those bees which fell in clusters to the ground will soon crawl to their companions in the hive, and soon after, those which flew off, will descend and follow their example. If it happen, however, that some bees will obstinately keep to the place where they at first fixed themselves, the branch is to be rubbed over with the juice of such plants as the creatures hate the smell of; such are elder, rue, and some others; and if this does not succeed, there must be linen rags burnt under them, the fumes of which will soon drive them off, and make them join their companions, who find themselves more at ease in the hive.

As it is necessary to render the places disagreeable to the bees from which they are to be taken into the hive, so, many people think it very proper to prepare the hive for their reception, by scenting it with such things as they love the smell of. To this purpose they rub the inside of it with bay and bean-flowers, and daub a little honey in some parts of it. This, however, does not seem necessary, thofe hives having been found to succeed full as well where it was not done, as thofe where it was. Reaumur's Hist. Inf. vol. x. p. 205.

Another method of getting a swarm from a branch of a high tree, is to cut off the branch with a saw, as gently and with as little disturbance to the bees as possible. In this case, when the branch is off, a man may carefully descend with it, and the bees will not quit their hold, but will be all carried where he pleases with it, and may by that means be very easily put into a hive.

Sometimes the bees, which go out in a swarm, fix upon a hole in a wall, or a hollow in the trunk of a tree, for the assembling themselves. This is a much better choice for them than the branch of a tree, but it is much worse for the person who is to hive them; for they are very difficult to be got out of these places. The common way of the country people is to attack these swarms in the middle of a cold night, and then they enlarge the opening from without, and placing the hive under it, scoop the bees out of their nest with a ladle, and put them into the hive.

Mr. Thorley tells us, that the best time to plant colonies of bees is either in March or April with new flocks, or in May or June with swarms. If swarms are used, procure, if possible, two the same day, and put them together in two boxes, or in a hive and a box; at night place them in your house, and with a knife and a little line and hair, dip close the mouth of the hive or upper box, so that not a bee may be able to go in, or out, except at the front door. If boxes are employed, you will, in a week or ten days, see the combs appear in them; but in a hive nothing can be observed till the bees have wrought down into the box. Never plant a colony with a single swarm, as Mr. Thorley says he has sometimes done, but with little success.

When the second box, or the box under the hive, appears full of bees and combs, it is a proper time to raise the colony in the dusk of the evening, which should be done in the following manner: place your empty box, with the sliding shutter drawn back, behind the house, near the colony that is to be raised, and at nearly the height of the floor, by the help of another empty box upon the ground; then lifting up the colony with as much expedition as possible, set it down upon the empty box, with the aperture of the colony close to the piece of wood nailed upon it, so that no single bee may get out; when this is done, lift the hive and two boxes, or the three boxes, into the house again, putting them in their proper place.

Mr. Thorley farther adds, that the most effectual method of preferring bees in common hives is, incorporating or uniting two flocks into one, by the help of a peculiar frame or opiate, which will put them entirely in your power for a time, so that you may dispose of, and distribute them at pleasure. The queen, in this operation, is immediately to be searched for and detained. Hives or flocks, which have swarmed once or twice, and are consequently reduced in their number, are the fittest to be joined together, as they will be thus greatly strengthened and improved. However, if you have a flock both rich in honey and full of bees, you may take it, by dividing the bees into two parts, and putting them into two other hives instead of one. But be careful to examine, whether the flock to which you design to join the bees of another, has honey enough to maintain the bees of both; for which purpose it should be full twenty pounds in weight.

The rippling fume used in this process is the fungus maximus or pulverulentus, or large mushroom, commonly known by the name of bunt, pucked, or frog-cheese; it is as
as big as a man's head, or bigger: when ripe, it is of a brown colour, turns to powder, and is exceeding light. Put one of these pucks into a large paper, prefing it to two-thirds of nearly half its bulk, and tying it very close; then place it in an oven some time after the household bread is drawn, and let it remain there all night; when it is dry enough to retain fire, it is fit for use in the following manner: cut off a piece of the puck as large as a hen's egg, and fix it in the end of a small flick flit for the purpose, and sharpened at the other end, and place this so that it may hang near the middle of an empty hive; this hive must be set with the mouth upward, in a pail or bucket, near the flock you intend to take: then set fire to the puck, and immediately place the flock of bees over it, tying a cloth round the hives, that no smoke may escape. In a little while you will hear the bees fall like drops of hail into the empty hive. You may then beat the top of the hive gently with your hand, to set as many out as you can: after this, loosen the cloth, lift off the hive to a table, knock it several times against the table, and several more bees will tumble out, and perhaps the queen among them; she is often one of the last that falls; if she is not there, search for her among the main body in the empty hive, spreading them for this purpose upon a table. You must proceed in the same manner with the other hive, with the bees of which these are to be united.

One of the queens being found, you must put the bees of both hives together; mingle them thoroughly, sprinkling them at the same time with a little ale and sugar, and put them among the combs of the latter hive, shaking them down in it. When they are all depoited, cover the hive with a cloth, bound close about it, and let them remain shut up all that night and the next day. Some time after this you will be sensible that they are awakened out of sleep. The second night after their union, in the dusk of the evening, gently remove the cloth from the mouth of the hive (taking care of yourself), and the bees will immediately fly forth with a great noise; but it being too late for them to take wing, they will soon return again: then infusing two pieces of tobacco-pipes to let in air, stop them close as before, and keep them thus confined for three or four days longer, after which the door may be left open.

The best time of the year for uniting them is when the young brood are all out, and before they begin to lodge in the empty cells, which they do in great numbers in cold weather and in winter. The operation should be performed early in the afternoon, that, having the greater light, the queen may be more easily found. The few bees that are left in the hive should be suffocated with sulphur.

Mr. Thorley observes, that he never knew such combined flocks conquered by robbers, and that they will either swarm the next summer, or yield a hive full of honey.

Mr. White's method of having a swarm into one or more of his boxes is as follows: take the loofe board, mentioned under the article Hive, and fasten it to one of the boxes, so as to stop the communication; this may be done by three of the flapes there mentioned, one on the top of the box near the front, the two others on the back near the top and near the bottom; let one end of the flape be thrust into a gimbal-hole made in the box, so that the other end may go as tight as possible over the loofe board, to keep it from slipping when it is handled. Be careful to fasten the fluter so close to the glass that no light may enter through it; and cover the box as soon as the bees are hived, with a linen cloth thrown loosely over it, or with green boughs to protect it from the heat of the sun. If the swarm be larger than usual, instead of fastening the loofe board to one box, you may join two boxes together with three flapes, leaving the communication open from one to the other, and then hive your bees in both. In all other respects they are to be hived in boxes after the same manner as in common hives. The door of the second box should be carefully flapped up and kept constantly closed, in order that the bees may have no entrance but through the first box.

In the swarming sealfons, says Mr. Isaac, hives should be in readiness for the swarms. Three iron hooks should be fastened to as many cords, tied together at such a distance from the hooks as to admit the hive between them, so that the hooks may be fastened in the sides of the hive at equal distances. The cords should be looped above the knot, so that the hive may be supported by them on a forked flick, eight or ten feet long, and pointed at the lower end. When a swarm rises, take some balm leaves and rub the inside of the hive with them, and place them on the outside under one of the cords; then by means of the long flick, wave the hive amongst the bees as they float in the air, and thrust the flick into the ground to support the hive; then walk off, and use your tinkling bell till you see them the ginning to enter, at which time the noise should cease. If they are not allured into the hive by these means, they will either pitch elsewhere or go off, in which case they should be followed if possible. If they pitch on the ground, put the hive over them, and shade them with boughs of trees. If they settle on a bush, hold the hive with one hand and shake the bush with the other, just strong enough to make them fall into the hive, and put it down on the ground across a flick, with the entrance a little elevated towards the south; but if they have fixed where this mode cannot be used, the manner of having will be more difficult and the success less certain. Mr. Isaac says, that he has sometimes been obliged to tie several flicks together to make a long crook, and to ascend a ladder so as to hold the hive on the points of a long pitch-fork, while an affiant flick with the crook the branch of a high tree on which a swarm had fixed, and the bees seemed glad to be hived. If the bees seem uneasy in the hive, the queen is not with them, or they are determined to go off. If they return to the flick they may swarm again soon; but if they go off and you can follow them, give the old flick another hive, and look about for the queen till they have settled, and avoid treading on any bees left you destroy the queen, or mistake the bees. If you find her, place her at the entrance, and you will thereby secure the swarm. Thorley, White, and Isaac, ubi supra. See SwARM.

HIVASSEE, in Geography, a river of America, which discharges itself into the Teneffee, after passing through the Cherokee town, about 40 miles below the mouth of the Clinch. N. lat. 35° 38'. W. long. 85° 3'. It is navigable till it penetrates the mountains on its S. side. These mountains, when polefed by the Britisfh, yielded ore, from which gold was extracted. A branch of the Hiwassee, called Amoco, almost interlocks a branch of the Mobile. The portage between them is short, and the road firm and level.

HLINKA, a town of Bohemia, in the circle of Churam; 12 miles S. of Chrudim.

HLIWINO, a town of Lithuania, in the palatinate of Minsk; 44 miles E. of Minsk.

HLUBOKI, a town of Roufian Lithuania; 40 miles S.E. of Breflaw.

HLUMCZA, a town of Poland, in the palatinate of Volhynia; 60 miles N. N. W. of Zytomiers.

HO, a town of China, in Szechuen. N. lat. 30° 8'. E. long. 105°. Allo, a city of the second rank, in Chen-fu. N. lat. 35° 48'. E. long. 102° 34'.-Allo, a city of the second
second rank, in Kiang-nan. N. lat. 31° 42'. E. long. 117° 54'.

HOACE, or A city of China, of the second rank, in Quang-tong. N. lat. 21° 58'. E. long. 109° 45'.

HOACHE, in Natural History, a name given by the Chinese to a peculiar kind of earth, which they have found very useful in the manufacture of their China-ware. It is called hoache from the word hoas, which signifies soft and gluttonous, and is described to us as being an earth approaching to the nature of chalk, but harder, and feeling like soap to the touch. There is great reason to believe, that this is either the same earth with our soap-rock of Cornwall, or something very like it. But we are to learn, in regard to the Chinese way of using it, that it is only one of the ingredients of their fine ware, not the whole matter of which it is made.

The Chinese physicians had long used this earth as a medicine, giving it in disorders of the lungs; but it is only of late times that the workmen in porcelain attempted to use it instead of kaolin. It succeeds, however, so well, that the porcelain made of it sells better in the Indies than any other kind. The grain of this porcelain is remarkably fine and even, so that it is fitter for receiving the finest pencilling than any other, and it may be made surprisingly light. But there is this disadvantage, that the whole is more brittle than ordinary china, and the just degree of baking it is very difficult to hit; without which it is never strong. The Chinese sometimes make the body of their vessels of the common China-ware, and dip them when dry into a thick liquor like cream, in which the hoache is dissolved; this gives a new and beautiful coat to the vessel. They give the common varnishing over this, and it succeeds to a very great perfection.

The manner in which the Chinese use it for this purpose is this: they first wash it clean with river water, to separate a yellow coat of earth, which lies near it in the mine where they dig it, and is often brought up with it. When it is thus cleaned, they beat it to powder, and mix in it large quantities of water; they stir the mixture well, and then letting the coarser part settle, they pour off the thick liquor, and let it stand till a substance like cream sediments, which they keep moist, and use, as before mentioned, to dip the vessels in, or else they dry it, and use it with the petunfe instead of the kaolin in the common manufactures.

It is said that a good porcelain-ware may be made with this earth alone without any other mixture; but the workmen themselves are unwilling to do this, and always choose, if they do not work in the common way, to add at least two parts of the petunfe to eight of the hoache, and with this mixture they make a very good ware, working it in the same manner as they do the petunfe and kaolin.

The hoache, though ever so proper to supply the place of the kaolin, could not be used in the common works, because it costs three times the price, it being much scarcer, and brought much farther.

There is another very elegant sort of China-ware, which depends entirely on the hoache for its beauty; it is all white, but though the surface is perfectly smooth and polished, there are thin flowers and other ornaments on it in a very delicate manner. The method of making this is as follows: they make the vessels of the common matter of the porcelain-ware; they then dissolve, in a sufficient quantity of clear water, as much of the refined hoache as will give it the confidence of a syrup. With this they pencil out the figures they intend on the surface of the vessel while not yet quite dry; this penetrates the surface, and the lines and strokes all appear very determinate. They let this dry thoroughly, and then cover the whole vessel with the common varnish of the porcelain.

When it has been baked the whole appears white, but the figures are very distinctly seen, and appear extremely beautiful. They are of a brighter white than any of the rest, and seem formed of a thin white vapour, running with regularity just under the surface of the vessel. They have a way of doing this with another sort of earth, which they call eckelao; but this requires more trouble, as it must be roasted and powdered before it is fit for use. The white of this also is not so fine when done as the other. Obscr. fur les Coutumes de l'Asie, p. 350, &c. See Porcelain.

HOACTZIN. See Phasianas Cristatus.

HOADLEY, BENJAMIN, in Biography, was born at Wellowham, in Kent, in the year 1676. He was educated in grammar learning under his father, who was a clergyman, and master of a private school in his native place, and in the year 1691 he was entered a pensioner of Catharine Hall, Cambridge. Here, in due time, he took his degrees, and became a tutor in the college, the duties of which office he discharged with great reputation. As a divine he was first settled lecturer of St. Mildred, in the Poultry, London. Here he continued ten years; during this period he held other preferment in the church, which he obtained through Dr. Sherlock, dean of St. Paul's. In 1703 he published "The Reasonableness of Conformity to the Church of England represented to the Defiling Ministers, in answer to the tenth Chapter of Mr. Calamy's Abridgment of Mr. Baxter's History of his Life and Times." This was the occasion of a controversy between Mr. Hoadley and Mr. Calamy, which was carried on with that moderation which did credit to both parties. In 1705 Mr. Hoadley preached a sermon before the lord mayor of London, which gave offence to the high-church party, and was followed by a long controversy, in which many very eminent clergymen took a share. After it had been continued a considerable time, the house of commons addressed the queen requiring her to give a regard for the signal services which Mr. Hoadley had rendered to the cause of civil and religious liberty, byשטlowing upon him some dignity in the church. In answer to this address the queen said, that she would take a proper opportunity of complying with their desire, which, however, the never did. Though neglected by his sovereign he was not forgotten, but was preferred, in 1710, by Mrs. Howland, grandmother of the duke of Bedford, to the rectory of Streatham. Of this, he says, "When fury seemed to be let loose, and to distinguish me particularly, I heretofore, unappalled, without my having ever seen her, or been seen by her, chose, by preferring me to the rectory of Streatham, then just vacant, to shew, in her own expression, that she was neither ashamed, nor afraid, to give me that public mark of her regard at that critical time." Almo as soon as king George ascended the throne Mr. Hoadley was nominated one of the chaplains to his majesty, having been created doctor of divinity by archbishop Wake. This was a prelude to higher honours and a more elevated place in that church to which his learning and talents gave him a just title. In 1715 he was raised to the see of Bangor. In 1717 he preached before the king his celebrated sermon on "The Nature of the Kingdom or Church of Christ," which excited against him no little clamour among the clergy of the high-church party, and led to the controversy which bears the bishop's name. No sooner had this sermon been printed by special command, than it was determined
mined to proceed against the author in convocation, as soon as it should fit. The lowest house drew up their representation, but before it could be brought into the upper house, that assembly was prorogued by the king's order, nor was it permitted to fit to do business till the heat of their resentment had subsided. Dr. Hoadley's sermon struck at the root of civil and ecclesiastical tyranny: he shewed, in the most decisive manner, that Christ was alone king in his own kingdom and the sole law-giver; that his kingdom is not of this world, and that consequently all encouragements and obstacles of this world were not what Christ approved, tending to make men of one profession, not of one faith; hypocrites not Christians. Another very important tract published by Dr. Hoadley in this controversy was entitled "The common Rights of Subjects defended, and the Nature of the Sacramental Test considered: in answer to Dr. Sher-lock's Vindication of the Test and Corporation Acts." The argument maintained in this piece is, that it is a profi-
tution of the holy sacrament to apply it to a purpose of a different nature from what the instigator solemnly appropriated to it, and to make that the tool of this world, which he ordered to have respect only to another: and that the test and corporation acts are repugnant to reason and to justice. In 1720 Dr. Hoadley was translated to the see of Hereford, and in 1723 he was raised to the much more valuable bishopric of Salisbury: still he employed his pen in vindicating the cause of liberty, which was ever near his heart. In 1732 he drew up a memoir of Dr. Samuel Clarke, which was prefixed to the posthumous works of that eminent divine. In the year 1734 he succeeded to the see of Winchelsey, and shortly after published a very useful treatise, entitled "A Plain Account of the Nature and End of the Sacrament of the Lord's Supper," &c. This work, which was intended to represent one of Christ's institutions in its primitive simplicity, has been abridged by Dr. Disnev, and published under the title of "The national Christian's Affiant to the worthy receiving of the Lord's Supper." Dr. Hoadley attained to the advanced age of eighty-five, when he died at his palace at Chelesa. He had ever distin-
guished himself by considerable learning and uncommon talents, which he consecrated in the most honourable manner to the service of mankind. He had at all times shewn him-
self ready to seize every opportunity to defend the cause of truth, virtue, and religion, and the principles of our excellent constitution, in whatever quarter attacked; and to affert and vindicate, on the most interesting occasions, and against the greatest names, the rights of the throne and those of Englishmen. An account of all the works of this great man may be found in the Supplement to the Biogra-
phies Britannica, to which the reader is referred.

Hoadley, Benjamin, M.D. eldest son of the bishop of Winchelsey of that name, was admitted to the Broad-street, on the 16th of February, 1705. He received his early education at the school of Dr. Newcome at Hackvye, and was admitted a pensioner of Bene't college, Cambridge, under the worthy archbishop Herring, who was at that time tutor. He determined to pursue medicine as a profession; and he was distinguished by the progrsses which he made in mathe-
matical and philosophical studies, under the celebrated blind professor Saunderson. He was created M.D. in 1728 by royal mandamus, and settled in London as a physician. He was early received into the Royal Society; and was made registar of Hereford, while his father held that see. In 1737 he read the Gulbenian lectures in the College of Phys-
icians, which he published in 1740. It was very honour-
able to his character that he held, for some years, the ap-
pointment of physician to both the houholders, being ac-
minated to that of the king in June, 1742, and to that of the prince of Wales in January, 1745, at a time when the two families were not upon the best terms with each other. He died at his house at Chelsea, on the 10th August 1757, leaving an issue, although twice married. He left the fol-
lowing works: the lectures, above alluded to, under the title of "Three Letters on the Organs of Refpiration, read at the College, &c." To which is added an Appendix containing Remarks on some experiments of Dr. Houlton, published in the Transactions of the Royal Society for the year 1756," 1740, 410. This work is characterized by Haller, as a very ingenious defence of a bad cause. 2. An Harccan Oration, "Oratio Anniversaria &c," 1742, which has been esteemed an elegant piece of Latinity. 3. "Obser-
vations on a Series of Electrical Experiments," by himself in conjunction with Mr. Wilson. 4. But Dr. Hoadley will be principally remembered as the author of the pleasing comedy, "The Sufficient Husband," written in 1747, which, by its own gaiety, and the admirable performance of Garrick, in the part of Ranger, became extremely popular, and it still affords fresh pleasure whenever reprented. He afterwards gave some affinitie to his friend Hogarth, in the composition of his "Analysis of Beauty." Dr. Hoad-
ley was a man of both elegant and solid accomplishments, pooffed of considerable learning in his profession, and an agreeable and sprightly companion. Hutchinon Biog. Med. Gen. Biog.

HOAI-KING. In Geogrophy, a city of China, of the first rank, in the province of Ho-nan, abounding with medicinal plants. N. lat. 35° 6'. E. long. 112° 34'.

HOAI-NGHAN, a city of China, of the first rank, in the province of Kiang-nan. It is situated in a marsh, and enclosed within a triple wall; the ground on which it stands is lower than the bed of the canal, the inhabitants live in a confluent dread of inundation. The suburbs extend to the distance of 2 leagues on each side of the canal, and form at their extremity a kind of port on the river Hoa-ho. This place is very populous, and carries on an active and brisk trade. One of the great mandarins, who inspect the canals, and supply the court with provisions, resides here. This city has two of the second and nine of the third classe, under its jurisdiction. N. lat. 53° 30'. E. long. 118° 47'.

HOAI-YU-KEOU, a town of Chinese Tartary. N. lat. 40° 54'. E. long. 117° 22'.

HOANG, Hoai-ho, or Yellow river, so called from the yellow colour of the mould and sand at its bottom and sides, a river of China, which has its sources in two lakes, among the mountains situated in that part of Tartary called Kokonor, about N. lat. 35°, E. long. 97°, and, after a very winding course of 2150 miles, through Tartary and China, discharges itself into the Eardern or Yellow sea, N. lat. 34° 4'. E. long. 119° 44'. It is broad but shallow, so as to be hardly navigable; it is rapid in its course, and often overflows its banks, so that it has been found necessary to make dykes in many places on its sides, and even round many towns in the province of Ho-nan. At about seventy miles from the sea, where it is crossed by the Imperial canal, the breadth is little more than a mile, and the depth about nine or ten feet, but the velocity is about seven or eight miles in the hour. Yu, the channeling of an old course across the provinces of Chan-fu, Chen-fu, Ho-nan, and Pe-chieh; and towards its mouth, in order to check its rapidity, he divided it into nine channels, by which it discharges itself into the sea, near the mountain of Kia-chie-chian, which then formed a promontory. Since Yu, to the present time, i.e. in the interval of about 5950 years, the river Hoa-ho has departed so much
much from its ancient course, that its mouth is at present six degrees farther south. It flowed into the sea formerly under the forty-third degree of N. lat. 3 at present nearly under the thirty-fourth. Befides, the mountain Kiu-che-chan, which was formerly united to the main land of Yung-ping-fou, stands at present in the sea, at the distance of 50 leagues to the S. of that city.

HOANG-TCHEOU, a city of China, of the first rank, in the province of Hou-quang, situated on the Yang-tze, and having under its jurisdiction one city of the second rank, and eight cities of the third. N. lat. 38° 28'. E. long. 114° 26'.—Allo, a town of Corea, in Hoan-hi, 83 miles N.W. of King-ki-tao. N. lat. 38° 42'. E. long. 125° 52'.

HOAPINSU, a small island in the Chinese sea, belonging to the group called "Liou-Kieou." N. lat. 25° 44'. E. long. 123° 34'.

HOAR FRONT, Pruina. See Frost.

HOARE, William, in Biography, was born in the year 1707, of respectable parents, at Eye in Suffolk, and received the advantages of education in a school, at that time of high reputation for classical instruction. He showed an early disposition for painting, and gave such inconceivable proofs of a natural talent for that art, at an annual prize exhibition, that, after his completion of the usual studies of the school, his father carried him to London, and placed him under the tuition of Grifoni, an Italian painter. From the skill of Grifoni the scholar could derive little profit; but it is probable, that from his conversation he imbibed that ardent desire of visiting the works of the Italian masters, which prompted him to fet the example of a system afterwards pursued with so much avidity and success by most of our young students in painting. The name of William Hoare stands first on the list of those English painters who have returned to Italy with a view to professional improvement.

Arriving at Rome, he placed himself in the school of Francesco Imperiali, and was the fellow pupil of Pompeo Battoni. During a residence of nine years in Italy, he made numerous copies of the historical works of the great masters, and he returned to England, filled with visionary hopes, and an ardent love of his profession, which did not desert him even at the latest period of an extended life.

Finding himself a stranger in London, and without the means of rendering his talents known, he accepted an invitation from some of his friends who resided at Bath, in Somersetshire, and there found such constant employment in painting portraits, that he was induced to settle in that city.

From the study of Rosalba's pictures, he added the practice of crayons to that of oil-painting, and carried it to a degree of excellence second only to the powers of that celebrated painter.

He maintained at Bath a very high character as a portrait painter, and he enjoyed scarcely less reputation for taste and literature; and, as to these attractive qualities, he added the most unblemished integrity, his house became the continual resort of men of rank and genius. In the course of fifty years of professional attention, he portrays most of the distinguished characters of the age.

Amidst this early affluence, he employed the earliest moments of his leisure in the indulgence of his favourite wish of higher achievement in his art. He gave to the altar of St. Michael's church, at Bath, a figure of Our Saviour, as large as, or larger than, life; and afterwards painted for the octagon chapel, in that city, an historical composition, representing, "The Miracle at the Pool of Bethesda."

These exertions procured him commissions for a few historical pictures, the principal merit of which consists in the display of an elegant taste, and faithful study of nature.

Refiding at a distance from the metropolis, where the competition of younger artists was continually accelerating the advance of English art, he retained to the last the style which he had adopted in the Italian school. His drawing was more correct than that of most of his contemporaries; but his works are deficient in the richness of colour and effect, which began generally, in his time, to prevail in the school of this country, and by which it is now so eminently distinguished.

His portraits of men were faithful resemblances of their originals, but they are seldom sufficiently divested of the formal air which was long thought requisite to the decorum of portraits. His portraits of women, particularly in crayons, have frequently much grace and softness; his most celebrated portrait in oil is a half-length of William Pitt, the first earl of Chatham.

On the formation of the Royal Academy he was elected one of the original members, and was a constant exhibitor for many years. He died at Bath in 1792.

HOARSENESS, in Medicine, rasceldo, an alteration in the voice, which gives it a preternatural roughness and diffluence, and generally a lower or graver tone. The word is sometimes also applied, though incorrectly, to a diminution or loss of the voice. It is called Sauvages Paraphonia catarhalis. Nofol. Method. Clafs VI. Gen. 16.

The ancient physicians agree in referring hoarsefulness to a roughness in the internal surface of the trachea or windpipe; and the moderns, before the time of Sauvages, attributed that supposed roughness to the enlargement of miliary glands in the part, consequent upon the action of cold, in the same manner as the cutis anferina, or goose-skin appearance, is produced in the skin by the same agent. But that nosophologist remarks, that if a German flute be wetted within, and afterwards fand thrown into it so as to roughen the internal surface of the tube, the tone is not rendered either flat or rough, as those physiologists suppose. It cannot be doubted, indeed, from what we know of the effects of inflammation in membranous parts, that this alteration of the voice arises from the thickened condition of the membrane lining the larynx, by which the diameter is altered and rendered irregular, and which, extending also to the muscles of vocalit, prevents them from contracting the aperture regularly or sufficiently. In other cases, where there is both a diminution of the power of voice, and a hoarse tone, and thee of considerable duration, the affection originates probably from ulceration and partial loss of substance about the larynx or glottis. In some instances, a loss of the voice seems to depend upon a degree of paralysis in the muscles of the larynx, by which they are disabled from opening and closing that passage. This variety of the disorder sometimes continues for months, or even years; and the voice generally returns very suddenly, even so as to alarm the patient. (Darwin's Zoonomia, Clafs III. 2. 1. 5.) A temporary hoarsefulness arises often from shouting or long and loud talking, by which a transient degree of inflammation appears to be produced in the larynx, and is accompanied by a feamation of foreens in the throat.

The hoarsefulness, accompanying a common catarrh, is, of course, the effect of exposure to cold; that which is occasioned by ulceration in the organs of the voice is commonly occasioned by the syphilitic virus, or some other chronic affection, to which the term leroofulous is sometimes applied.

The cure of hoarsefulness will necessarily be various accord-
ing to the nature and origin of it; and as it is commonly only symptomatic of some other disease, will consist in removing that primary affection. When it is connected with a common cold and cough, or fore throat, it will cease with the inflammation accompanying them; but it may be much relieved by infusing the cream of water alone, or of water and vinegar, or of water and ether. Blisters to the external faces often relieve the cutaneous hoarfrost, and sometimes also the paralytic hoarfrost. In the latter variety, and in the hoarfrost attendant on chronic coughs in old and feeble people, as well as in some chronic ulcerations of the mouth and throat, certain warm and stimulant gargles and liniments have been used with advantage. In such cases Dr. Cullen recommended the juice of the hedges-mullard (Erythrinum officinale) mixed with an equal quantity of honey or sugar. When the erythrinum was not at hand, Dr. Cullen substituted a syrup of hoar-radii (coelocaria amoracca). “I have found one drachm of the root,” he observes, “freely scraped down, was enough for four ounces of water, to be infused in a clove vessell for two hours, and made into a syrup with double its weight of sugar. A tea-spoonful or two of this syrup, swallowed before hand, or at least repeated two or three times, we have found very successful in relieving hoarfrost.” Cullen Mat. Med.

In the complete loss of voice, Dr. Darwin recommends electric shocks to be passed through the larynx, by which two young ladies were cured in a fortnight. He likewise suggests the administration of emetics, gargles of decoction of feneca, and frequent endeavours to shout and sing—fright externally, and then bathing.

HOASE, in Geography, a country of Chinaeic Tartary, governed by a Mongol prince, tributary to the empire, formed into two standards; situated to the N. of Peking. N. lat. 45°.

HOATH. See Houth.

HOAT-SIANG, a town of Thibet; 50 miles E.S.E. of Hami. N. lat. 40° 55′. E. long. 99° 19′.

HOBAL, in Mythology, an idol of the ancient Arabs, the worship of which at Mecca was destroyed by Mahomet.

HOBASCH, in Geography, a town of Arabia, in the province of Yemen; 44 miles E. of Zebid. N. lat. 4° 18′. E. long. 44°.

HOBBIES KEYS, a small clatter of islets, and rocks, in the Spanish Main, near the Mogquito shore. N. lat. 12° 18′. W. long. 82° 5′.

HOBBIMA, Minderhout, in Biography, a most excellent landscape painter, born at Antwerp about the year 1617. It is not exactly known under whom he learnt the principles of his art; but that nature was his ultimate guide to the perfection he attained, is very evident in his pictures, than which none were ever painted more true.

His choice of subjects, for they generally appear to have been portraits of particular places, is exceedingly picturesque, though of a low and common kind. The border of a wood with a few scattered huts and fields visible through the trees; a narrow lane with a cottage and hedge-rows; a corn-field, and village at a short distance, in his hands, became interesting, from the skill with which he arranged the chiaro-levuro and colouring, and the brilliancy and freedom of touch whereby he gave the full character of each object, and its local place in the perspective of the picture. The forms of his trees are purely imitated from nature, without any apparent attempts to idealize them, to give them a more compact mass in their extreme parts, as Claude, with a more exalted taste, has effected. Hoosliima appears to have taken nature as he found her, and been contented with representing her truly; and he has certainly acquired the first name amongst those who have taken this line of study, which his own countrymen have generally done. Ruyfdael had better felections than he, but was not so rich in colour, nor so powerful in effect. Many of his pictures are supplied with figures by Ollade, A. Vanweydevle, and other skilful masons, which gives them additional value; and they are now very highly valued and eagerly sought after.

HOBBISM, or Philosophy of Hobbes, in the History of Literature, denotes the metaphysical, moral, religious, and political opinions of Thomas Hobbes, a celebrated English writer, who was born at Malmedbury, in Wiltshire, in the year 1588.

Having distinguished himself in early life by his genius, application, and improvement, he was taken into the service and protection of the Devonshire family, which continued, with little interruption, as long as he lived, and which gave him an opportunity of pursuing his studies, and of forming connections with persons of the first reputation for learning and science both at home and abroad.

His first work was an English translation of the “History of Thucydides,” which he published with a view to the state of his country, in order to shew the fatal consequences of intrigue broils.

Having acquired a thorough acquaintance with the Latin and Greek languages, he applied himself to the study of mathematics; and particularly to the works of Euclid, which he read and admired, principally on account of the clearness of his reasoning, the connection of his arguments, and the wonderful perciption of his method. He also devoted his leisure hours to natural philosophy, and especially to mechanics and the causes of animal motion.

In 1642 he retired to Paris, where he became acquainted with the famous Des Cartes, with whom he afterwards corresponded, and whose doctrine concerning innate ideas he strenuously opposed.

In 1642 he printed a few copies of his book “De Cive,” a more complete edition of which was printed in Holland in 1647, by the care of Dr. Sorbiere. To this edition two recommendatory letters are prefixed; one written by Gaffendi and the other by Merlenne, with whom Mr. Hobbes was on terms of intimate friendship.

In 1650, two other treaties were published at London; one entitled “Human Nature,” and another entitled “De Corpore Politico,” or the Elements of Law. During this time he had been digerting his religious, political, and moral principles, into a complete system, which he entitled “Leviathan” and which was printed in English, at London, in that and the following year. Soon after this publication he returned to England, and joined in communion with a congregation where the service of the church of England was used, and continued to reflect thither.

In 1654 he published his letter upon “Liberty and Necessity,” which occasioned a long controversy between him and Dr. Bramhall, afterward lord primate of Ireland. About this time he likewise began a controversy with Dr. Wallis of Oxford, which lasted as long as he lived, and in which he had the misfortune to have all the mathematicians against him. This controversy did him no credit; for though he was once and again refuted, and his mistakes were clearly pointed out, yet, such was the obstinacy of his temper, he adhered as pertinaciously as ever to his old opinions, and rendered that
a personal quarrel, which ought to have continued a literary dispute. He was no less positive and imperious in maintaining his moral, religious, and political sentiments; and he seems to have discovered, on a variety of occasions, a very unbecoming opinion of his own abilities, and a supercilious contempt for those of other men.

After the publication, in 1660, the king settled upon him a pension of a hundred pounds a year; but notwithstanding this favour, his Leviathan and his treatise De Cive were cenured by parliament in 1666, a circumstance which much alarmed him. At the same time a bill was brought into the house of commons to punish atheism and profaneness, which, it is said, induced Mr. Hobbes to write or enlarge his book concerning Hereby.

In 1675, he published his English edition of the Iliad and Odyssey; in 1676 his dispute with Dr. Laney, bishop of Ely, concerning Liberty and Necessity, was printed; in 1678, appeared his "Decameron Physiologicum," or ten Dialogues of Natural Philosophy; and about the same time a new edition of the "Art of Rhetoric," to which he added a Dialogue between a Philosopher and a Student of the Common Law of England; in the same year he also published his "Behemoth," or History of the Civil Wars from 1640 to 1660.

Mr. Hobbes retained his understanding to his last sickness; infomuch that he was not only capable of studying mathematics when above eighty-six years old, but also of writing very long poems. It has been said, that he was afraid of apparitions and spirits; but his friends call this a fable, though they acknowledge that he was afraid of being alone, and ascribe it to a fear of being affainiated. Mr. Bayle observes, that he meditated much more than he had read, and that he never cared to collect a large library; and Mr. Hobbes says of himself, that if he had beckoned as much time on reading as other men of letters, he should have been as ignorant as they. He was a great admirer of Homer, Virgil, Thucydidès, and Euclid; but he made no account of large libraries, observing that men, for the most part, following one another's steps like sheep, have seldom the courage to go out of the trodden paths and roads which are prefered to them by their guides. Mr. Hobbes died at the house of his patron, the earl of Devonshire, in the year 1679. For a fuller account of his life and writings, the reader may consult Bayle, or the Biographia Britannica, article Hobbes.

Mr. Hobbes's religious and political sentiments are chiefly contained in his book De Cive and his Leviathan; and it is certain, that there have been few persons whose writings, by the extraordinary abilities of their author and the singularity of his notions, for the dogmatical manner in which they are delivered, and the agreeableness of their style, have had a more pernicious influence in spreading infidelity and irreligion, though none of them are directly levelled against revealed religion.

Mr. Hobbes has been unjustly charged with atheism; for he expressly acknowledges the existence of God, and that we must necessarily arise from the effects which we behold, to the eternal power of all powers, and cause of all causes; and he blames the absurdity of those, who call the world, or the soul of the world, God: nevertheless, he denies that we know any more of him than he exists, and seems plainly to make him corporal; for he affirms, that that which is not body is nothing at all: "Dantur nona insignificantia; hujus generis est sublantia incorpora." Religion, he says, arises from the fear of power invisible, feigned by the mind, or imagined from tales publicly allowed, as superflition arises from those that are not allowed; and he elsewhere resolves religion into opinions of ghosts, ignorance of second-causes, devotion to what men fear, and taking things casual for propheticall. He takes pains in many of his works to prove man to be a necessary agent (if these contradictory terms can be properly joined), and expressly affirms the materiality and mortality of the human soul; alleging, against the well-known maxim of Des Cartes, "I think, therefore, I am," another maxim of his own, "I think, therefore, matter can think." And he represents the doctrine concerning the distinction between soul and body in man to be an error, contracted by the contagion of the demonology of the Greeks. The belief of a future state, he says, is grounded upon other men's faying that they knew it supernaturally, or that they knew those that knew them, that knew others, that knew it supernaturally. With regard to revealed religion, he treats the pretense to inspiration as a sign of madness; he alleges that the books of Moses, and the historical writings of the Old Testament, were not written by those whose names they bear; and that they are derived to us from no higher authority than that of Ezra. As to the books of the New Testament, he acknowledges, that they are the true registers of those things which were done and said by the prophets and apostles; but he pretends, that they were not received as of divine authority in the Christian church, till they were established by the council of Laodicea, in the year of Christ 364. Though he sometimes seems to speak with veneration of the sacred writings, and to make the laws of scripture the laws of God, yet he expressly affirms, that we have no assurance of the certainty of scripture but the authority of the church, or the authority of the commonwealth; that the precepts of scripture derive all their obligation from the will of the magistrate; and that the magistrate is the authoritative interpreter of all scripture doctrines, to whom we are bound to submit. On the same principle he maintains, that the private reason must submit to the public, viz. to God's lieutenant; that a subject may be allowed to deny Christ in words, provided he retains the faith of Christ in his heart, when commanded by his sovereign; and that idolatry, to which a man is compelled by the terror of death, is no idolatry.

Mr. Hobbes's opinions with regard to natural religion and civil government are equally erroneous and extravagant; he affirms, that by the law of nature every man has a right to all things, and over all persons, and that the natural condition of man is a state of war, a war of all men against all men; that every man acts reasonably, who endeavours, as far as possible, to make all the perfections of others, till he sees no other power great enough to endanger him; that the civil laws are the only rules of good and evil, just and unjust, honest and dishonest, and that antecedently to such laws every action is in its own nature indifferent; that there is nothing good or evil in itself, nor any common laws constituting what is naturally just or unjust; that all things are estimated by what every man judgeth to be fit, where there is no civil government, and by the laws of society, where society is established; that the power of the sovereign is absolute, and that he is not bound by any compact with his subjects; that nothing the sovereign can do to the subject can properly be called injurious or wrong; and that the king's word is sufficient to take any thing from any subject, if there be need, and the king is judge of that need. "Non verita, sed anteriora faciunt legem." And yet he elsewhere says, "Obligatio civium erga eum qui dominum habet potestatem tandem nec dumius permanere intelligitur, quonam potestas eves proteget." Wood, in his Athenae Oxonienses, vol. ii. p. 640, has affected, that:
that Mr. Hobbes, in advanced life, retracted many of his opinions published in his Leviathan, &c., and composed an apology for himself and his writings; but the authenticity of this apology has been disputed. Leland's View of the
by Dr. Macclare, vol. v.

HOBBY was a name formerly given to strong active horses of a smaller size; they are reported to have been originally natives of Ireland, and were much liked and used. Nags answer the same definition as to size, qualities, and
employments.

Hobby, in Ornithology, the English name of a hawk of the long-winged kind, the falco subrubet of Linnæus, called by many authors, by the name subrubet, the name by which others express the ring-tail and harrier. See Falco.

HOBBYHORSE-HEAD, in Mining, signifies part of
the pully gear of a coal gin, fixed over the drawing-shaft.

HOGBÖLIN is a name vulgarly applied to hogs or
apparitions. Skinner calls the word hogbolin, and derives it from Robin Goodfellow, Hob being the nick-name of Robin; but Wallis and Junius, with greater probability, derive it from hogbolin, cypog, because they are supposed to hop without moving both their feet. Johnfon.

HOBITS, in Gunpow. See Howitzer.

HOBBLERS, or Hobbers, Hobblan, in our Ancient
Counsels, were men who, by their tenure, were obliged to maintain a light horse or hobby, (whence their name,) for the certifying any invasion towards the sea-fide.

The name was also used for certain Irish knights, who used to serve as light-horsemen upon hobbies. (15 Ed. III.
flat. i. c. 25, and flat. 5. c. 8.) The term, according to
Spelman, continued till the time of Henry VIII. or that of
queen Mary; when the troops were distinguished by the
name of demilunes and light horse. They are mentioned
as part of the British army that attended king Edward
II. into Scotland in the year 1322. Sometimes archers were mounted on light horses; and they were hence
fabled hobby-lancers.

HOBR-MAIL, a nail with a thick strong head, used in
fixing a hobby or little horse. Johnfon.

HOB-NOB, or Habnab, a cant word formed from
hop to hop, and denoting an event which happens at random
or by mere chance. Johnfon.

HOBBOO, a name given by the people of Othai, and
in the neighbouring islands of the South Sea, to their
superfine cloth. It is the thinnest and most finiished preparation of the anita, which fee.

HOBRECHT, Jacob, in Biography, or as the Italians
write it, Orebct, or Obreth, the most ancient composer
of masses, in correct counter-point of four parts, that are
come down to us. He was a Netherlander, and the
medical preceptor of Erasmus, as Dovmon was formerly of
Socrates. Giareaus, the disciple of Erasmus, says, that
he had frequently heard his preceptor speak of Hobreth as
a musician who had no superior, and says, that he had such
a rapid and wonderful facility in writing, that he composed an
excellent mass in one night, which was very much admired by
the learned. Indeed, in fearing his name "Si Dederis," which
was printed at Venice in 1503, it appears, though
the movements are somewhat too similar in subject, that the
counterpoint is clear, clean, and masterly. And this is the
chief praise that is justly due to most of the compositions of
the fame period; which, in other respects, so much resemble
each other, that a few specimens would exhibit almost
all the variety of melody and measure which the productions
of a whole century can furnish. Indeed, as air and grace
were not at this time the objects of a composer's pursuits,
they should not be sought or expected. There, however,
who have heard modern melody, harmony, and modulation,
to a degree of fatuity, and admire the fugues, canons, and
other ingenious contrivances of the sixteenth and seventeenth
centuries, would have great pleasure in the performance or
contemplation of such music as this, which is become new
by excess of antiquity. Few or none of the paffages have
been retained in modern music; and the harmony and modu-
lation having been regulated by the ecclesiastical tones, or
modes, which have been so long exploded in this country,
extinguished would be as new to a dilettante of the present
age, as it he now new heard music for the first time; so
that, those who can tolerate nothing but what is ancient,
and those, who are in constant search of something new, will,
in these authors, find music equally adapted to their several
tastes, and be likewise furnished with an excuse for their
faddishnefs.

HOBROE, in Geography, a town of Denmark, in North
Jutland, and diocese of Viborg; 16 miles N.E. of
Viborg. N. lat. 56 38'. E. long. 9° 49'.

HOBSON's-Cheyne, a vulgar proverbial expression, ap-
plicated to that kind of choice in which there is no alternative.
It is said to be derived from the name of a carrier at Cambridge,
who let out hackney horses, and obliged each customer to
take in his turn, that horse which stood next the flable door.

Scott.

HOBY, in Geography, a town of Sweden, in SuDarma-
nia; 15 miles N.W. of Nikioping.

HOCHAUSS, a town of Austrift; nine miles S.S.W. of
Algen.

HOCHBERG, a marquisate of Germany, annexed to the
marginate of Baden, deriving its name from an an-
cient castle, situated two miles N.E. from Emendingen,
which is the principal town.

HOCHENAU, a town of Austrift; nine miles E.N.E.
of Zillerfeldorf.

HOCHFELDEN, a town of France, in the depart-
ment of the Lower Rhine, and chief place of a canton, in the
district of Saverne; 12 miles N.W. of Strafburg. The
place contains 1620, and the canton 11,954 inhabitants, on
a territory of 150 kilometres, in 30 communes.

HOCHLAND, HOCHLAND, or Hochland; an islet or rock
in the middle of the gulf of Finland, on an oblong form,
about 8 miles in circumference, having upon it two light-
houses, and about 30 families of Finns. In the heart of
the island is a deep and gloomy vale about 100 fathoms wide. The
soil of this island is generally swampy; but it is not defitute
of wood, such as pines, firs, birch, ash, &c. On the
highest rocks are three lakes, which are not without fish.
Of domestic animals here are a few cattle and a flock or two
of sheep. Of wild fowl there are various species. Seeds
abound and herring are plentiful. N. lat. 60° 3'.
E. long. 27°.

HOCHST, a town of Germany, situated on the Main;
6 miles W. of Frankfort.

HOCHSTADT, a town of Bohemia, in the circle of
Böhmens; 11 miles from Prag.

HOCHSTATT, or Hochstatt, a town of Bavaria,
the principality of Neuffen, on the Danube. Near this
place was fought the famous battle of Blenheim (see Blen-
hem); 12 miles N.W. of Augsburg.

HOCHSTETT', a town of the bishopric of Bamberg,
on the Alzach; 13 miles S. of Bamberg. N. lat. 49° 40'
E. long. 10° 47'.

HOCHWEIß, a town of Hungary; 20 miles W.S.W.
of Kremnitz.

HOCK. See Ham.
HODEIDA, in Geography, a sea-port town of Arabia, on the Red sea, with a harbour fit only for small vessels. The jurisdiction of the Doha, who is accountable only to the Imam, is confined to this city. His revenue consists in part of the duties upon coffee exported. The manton-house of the Doha, the custom-house, and the houses of the principal merchants, are constructed of stone; the rest of the town is composed of huts built on the ordinary style. Near the sea stands a small citadel, incapable of affording a very strong defence. This city has its patron saint Schick “Sadik,” who is honoured with due veneration. At the distance of 1½ mile from Hodeida is a well of excellent water, which supplies the inhabitants.

HODESTEIN, in Natural History. See Exochirii.

HOGGE, HOGG, in Geography, a town of Sweden, in the north of the coast of Vasa; 45 miles N. W. of Uddevalla.

HODAM, a town of Scotland, in the county of Dumfries; 10 miles E. of Dumfries.

HODDESDON, a market-town and chapelry in the parishes of Amwell and Broxbourn, in the hundred and county of Hertford, England, is situated near the river Lea; 17 miles distant from London. It consists principally of one street, and, in the year 1801, contained 227 houses, and 1227 inhabitants. The privileges of a weekly market, held on Tuesdays, and a three days annual fair, were granted by Henry VIII. The original market-house, a curious edifice of wood, supported on arches, is yet standing, and is decorated with a number of rude and grotesque figures, carved on different parts. The chapel, a neat brick building, was erected about the year 1786, on the site of an ancient structure. Near the market-house is a conduit of good water, which is supplied by pipes from a spring at some distance; it was built by the Rawdons, a respectable family in this town; and is kept in order pursuant to the will of Marmande Rawdon, esq, who, in 1679, bequeathed an annual provision for that purpose. The town is poled by an incorporated grammar-school; and in the vicinity is a large cotton-mill. Near the southern extremity of the town is a large house, which presents, both externally and internally, various specimens of curious architecture, sculpture, and carving. See Chauncey’s ‘History, &c, of Hertfordshire,’ and Lysons’s ‘Environ of London,’ 4to. 1811.

HODEGOS, a term purely Greek, simply, signifying guide. The word is chiefly used as the title of a book composed by Athanasius the Statae, toward the close of the fifth century; being a method of disputing against the heretics, particularly the Acephali.

Mr. Toland has also published a dissertation under the same title. Its subject is the pillar of fire, &c, which went before the Israelites as a guide in the desert.

HODGES, William, R.A., a landscape painter, who received his tuition in the art from Wilton, whom he assisted for some time, and under whom he acquired a good eye for colouring, and great freedom and boldness of hand; but unhappily, like too many pupils, he caught the defects of his master more powerfully than his beauties; and, in consequence, too loose in his definition of forms, by which means, that which added grace to the works of the master, became slovenliness in the pupil. "Hodges had the boldness and neglect of Wilton, but not genius enough to give authority to the former, or make us forgive the latter; too inaccurate for scene-painting, too mannered for local representation, and not sublime or comprehensive enough for poetic landscape; yet, by more decision of hand, nearer to excellence than mediocrity; and, perhaps, superior to some who surpassed him in perspective, or diligence of execution." He accepted an appointment to go out draughtsman with Capt. Cook on his second voyage to the South seas, from which he returned after an absence of three years, and painted some pictures for the admiralty, of scenes in Otaheite and Ulitete. Afterwards, under the patronage of Warren Hatlings, he visited the East Indies, where he acquired a decent fortune. On his return home, after practicing the art some time, he engaged in commercial and banking speculations; which, not proving successful, he sunk under the disappointment, and died in 1797, aged 55.

HODMAN, a cant term formerly used for a young scholar admitted from Weisminster-school to be student in Chrift-church, in Oxford.

HODOMETRICAL (of δόμος, way, and μέτρον, I measure, ) method of finding the longitude at sea, is that of the computation of the measure of the way of a ship between place and place, i.e. observing the several rhumbs or lines in which the ship sails, what way she has made, or how many leagues and parts of a league she has run. This method is liable to great errors.

HODY, Humphrey, in Biography, was born at Odcombe, in Somersetshire, in 1659, of which place his father was rector. He was educated at a grammar-school, and completed his studies at Wadham college, Oxford, where he took his degree, and was afterwards chosen fellow and tutor. In 1681, and 1682, he wrote his learned dissertation on Arifteas's History of the Seventy-two Interpreters, which was intended to show, that it was the invention of some Hellenic Jew, and written on purpose to recommend and give greater authority to the Greek version of the Old Testament, which, from this story, has received the name of Septuagint. In 1689, Mr. Hody wrote the prelomogena to John Malela's "Chronicle," which was published at Oxford two years afterwards. In 1692, he took his degree of D.D., and soon after published a treatise entitled "The Refurrexion of the fame Body aftered." After this he obtained some considerable preferment in the church, and in the beginning of the reign of queen Anne when the controversy concerning the powers and privileges of an English synod, or convocation, was warmly agitated, Dr. Hody published "A History of English Councils and Convocations, and of the Clergy sitting in Parliament, in which is also comprehended the History of Parliaments, with an Account of our ancient Laws." This work brings down the history from the first synod, which is mentioned to have been held in this island, viz. that of Verulam, in 446, to the beginning of the reign of Henry VIII. Dr. Hody was author of many other learned works, and left behind him, which was published in 1742, a work in MS. entitled "De Graecis illustribus Lingua Graece Literarumque Humaniorum Infpraakribus, eorum Vitis, Scriptis et Eloquiis." This work consists of two books, of which the first treats of the learned Greeks who came to Italy before, and the second, of those who came after the taking of Constantinople. Dr. Hody died in 1706, in the 48th year of his age.

HOE, in Agriculture, the usual name of a tool employed in tillage husbandry, well known to the modern farmer, and which is constructed in different modes and forms, in order to serve different purposes in cultivation. Tools of this nature are principally distinguished into two kinds, from the differences in the methods in which they are made use of; as hand and horse hoes, the former being used by the hands of the labourer, while the latter are wholly employed by the powers of the horse. Hand-hoes are, likewise, chiefly had recourse to, where the crops are put into the ground in the broad-call, or narrow-row syltems, but horse-hoes in such as are sown in distant drills in a regular manner in regard to the rows or lines. Tho'e of the latter sort are far more powerful in their work than tho'e of the hand kind, and capable of executing the business with much greater dispatch.

Hoe, Hand. The variations in the shape and construction of this kind of hoe are numerous, but the old square hand-hoe, which is in use for a great variety of purposes, such as tho' of common hoeing, thinning, and setting out different crops of the turnip and other similar kinds sown in the broad-call mode; as well as occasionally for striking out the supernumerary plants in such as are cultivated in the row or drill method, is commonly well known to the farmer. It is in general constructed of a square piece of thin iron, which has a hole and fort of socket formed in the middle, on the upper side, into which the handle is fastened; though in some instances a kind of hoop is formed, which is attached to each extremity of the square part, the middle constituting a fort of socket which receives the handle. Some consider this as forming an improvement in the tool, by admitting the mould to pass through the part which constitutes the bow.

These kinds of tools are also made of different dimensions, in order to their more ready application to different sorts of crops and grounds. The most usual sizes are those given below:

<table>
<thead>

</table>

It is usual to employ the two first descriptions of hoes in the more early growth of several sorts of field crops, such as those of the carrot and parsnip kinds, as well as occasionally for wheat and other grain crops. The four-inch size is also sometimes used for these, as the first hoeings of turnip crops and others of the small seed kind.

Eight and nine-inch hand-hoes are more commonly made use of for the later turnip crops, and for those of the pea and bean sorts, on moist kinds of soil.

The last two sizes of hand-hoes are for the most part employed for the early turnip crops, on such soils as are of a sandy or loamy quality and free from stones; and, likewise, occasionally on such as are of a flinty nature.

For the purpose of thinning out such plants as stand in a very close state, in a more perfect and effectual manner than by the common hoe, in various kinds of crops, a triangular tool of this sort has been constructed and had recourse to, which is found to answer well. In it one of the points of the angles is placed in a downward direction, by which means the
the workman is enabled to cut out the useless plants with a considerable degree of exactness.

And another tool of this nature, which has two cutting points for breaking up and dividing the ground, has been found very beneficial in different situations. It is called the double hand-hoe. It is used for preparing the soil for weeds, and for raising small crops. It consists of two blades, the one being fixed, the other movable, and the two working together to cut and divide the soil. It is said to be very effective in Portugal, and is used for many purposes, especially in the cultivation of small crops and in the preparation of the soil for the cultivation of small fruits.

The double hand-hoe is still occasionally in use in some places, and is a tool that is simple in its construction, and capable of being had recourse to with benefit on soils of the more open and light description.

Hoe, Brog. This is a tool of the hoe kind that has been advised by some, as more adapted to particular uses than those of the ordinary hand-hoe, as for the hoeing between the rows of such grain crops as are distributed at narrow distances, as performing the work not only with more expedition, but in a more effectual manner.

Hoe, Macdougal. This is a tool of the hoe description, which bears the name of its inventor or improver, and which has somewhat the form of a small light plough, being drawn by a labourer, who is attached to it by a proper contrivance before, and directed by another behind. It is a very convenient and useful implement in many instances, especially where the crops stand at considerable distances in the rows, so as to permit it to work freely. As open wheels are constantly liable to clog and fill up, it might probably be an advantage in this case to have the wheels made perfectly solid.

Hoe, Hoof. This is a very powerful implement of the hoe sort, which is now much in use for the cultivation of small crops, that are sown in the drill or row method.

The tools of this description that are employed in the different counties of the kingdom, are extremely various in their nature, form, and construction, according to the uses and purposes for which they are designed, as well as the peculiar situations and circumstances of the lands on which they are to be employed, and the nature of the drill machines by which the crops are put into the ground. They also differ greatly in their weights and fizes, as well as in the shapes of the cutting parts or hoes.

But all the different kinds of hoes of this nature have a very great superiority and advantage over those of the hand kind when properly formed, not only in point of dispatch from their working upon a great number of rows at the same time, but from their executing the busines in a better manner, and in a much more perfect manner. It is obvious, that by means of this description of hoe, the earth can be much more completely furrowed and loosened about the roots of the plants, and the ground kept far more clean and free from weeds than by the old method, while the sowing in labour and expense is very considerable. There can, therefore, be no doubt of the propriety of using them as much as possible in the busines of modern husbandry.

Among the numerous implements of this kind which have been lately invented, the expanding horse-hoe, and fixed horse-hoe, described in Mr. Amos's work on drill-husbandry, are deserving of notice, as being practical tools. The former has a superiority in many cases from the circumstance of its being formed with expanding flares, which can be regulated to such distances as may be proper within the limits of twelve and thirty inches. It is found extremely beneficial in the hoeing of bean crops, whether sown in drills or equidistant rows. Likewise, in crops of the potato and cabbage kinds. The inventor has had much recourse to it for those purposes in the county of Lincoln.

The fixed horse-hoe may likewise be very useful in different situations of grain-crops, which have small intervals, such as those of nine inches, from its being capable of regulation in so far as the rows are concerned. It has also been found capable of application in the preparation and cultivation of land.
HOE.

lands of the All, sandy, and gravelly descriptions, as well as in such as are greatly over-run with weeds and other similar trumpery, by means of having recourse to teeth, times, or other coulters, in the room of the triangular hoes; which should be fixed in the tool in such a manner that they may not only cut and divide the more superficial parts of the soil, but also effectually stir it below.

A convenient horse-hoe, for the purpose of hoeing a number of rows at the same time, is capable of being furnished by the drill-machine, improved by Mr. Cook, merely by removing the drill-coulters, and supplying their places with proper shares for hoeing. But in doing this it must be observed, that foils of different qualities and textures will require shares of different forms and sizes, but which can only be regulated by means of experience in any particular fort of land. In sandy, loamy, and all light sorts of soil, or such as have been perfectly broken down and reduced by tillage, shares from five to six inches in breadth for nine-inch drills, and those of eight inches in breadth for twelve-inch drills, will perform their business in a safe and effectual manner. But in strong clays, which are intermixed with pebbles, the shares of the hoes must not have so much breadth; and it is not improbable but that there may be some foils wholly incapable of flat-hoeing. Where, however, the texture of the soil in the intervals of the rows of grain is capable of being torn and tilled by long narrow plates of iron, having the forms of points or chisels introduced into the fangs of the hoe-shares, instead of the hoe-plates, there will be very great advantage obtained in the work. The hoe-plates are capable of being regulated so as to operate to a greater or less depth by different contrivances. It is found that ground cannot lie in too level a state on the surface for the work of effectual and expeditious horse-hoeing. In cases, however, where the ridges or lands are in so convex or rounded a state, as that the whole of the hoe-plates are incapable of performing the work in an equally deep manner in the same operation; such as cannot be rendered useful may be taken out and laid by.

It is suggested by the improver of this horse-hoe, that it is capable of being applied to several other beneficial purposes, in addition to that of hoeing drilled corn crops, such as cutting up the rows of stubble as soon as the produce has been removed, with all such weeds as may have escaped the hoe, and the furring of summer-follows, etc. With one man, two horses, and a boy, it is said that ten acres are capable of being wrought over in the course of a day; which is a great convenience, especially in the busy harvest season, when it would be wholly impossible to spare such a number of men and horses as would be necessary to effect the business with common ploughs. The same expedient method is also capable of affording very great advantages, in cutting up the stubbles, either before or directly after the crops have been taken away, as time may be thereby gained for a second fowing of grass-seeds where the first may have misfired, and on cole, rape, and turnips, for the food of sheep or cattle, during the winter or spring.

Another simple and convenient tool of this description, which has been lately employed with success, is the drill horse-hoe. It has been used in hoeing and cleaning drilled wheat crops with considerable advantage, in the practice of I. C. Curwen, etc., in Cumberland, who states, that “the simplicity and ease with which it is worked, has enabled him this season to give his wheat-crop, which exceeds one hundred acres, two cleanings, at an expense somewhat less than a shilling per acre each operation; a man and boy, with one horse, being able to clean above seven acres per day.

The direction of the harrow, to prevent its injuring the grain, is effected by an alteration of the chain by which it is attached to the wheels. The distance of the other teeth from the centre tooth must be regulated by the width of the drills. In case they exceed a foot, the harrow should be broader, to admit of another row of teeth. To clean at nine inches, two inches and a half are allowed on each side of the centre tooth, by which means every part of the earth is cut between the rows of grain. The size and strength of the teeth must be regulated by the nature of the soil.”

Upon the utility of this hoe, Mr. Dykes has remarked, “that its effects appeared to him most highly beneficial, in clearing away in the spring all the weeds that had grown during the winter, amongst the wheat, without the least injury to the grain; and also in raising up the top soil, which had become sod and heavy, and thus enabling the spring shoot to take root more easily; and, at the same time, it covers the roots of the corn with fresh soil, which are often left quite bare by the washing of the rains in winter, and subject to be killed by the frost.” It also enables the farmer to sow his barley much earlier than he could broad-cast, as it will both clear the corn previous to sowing the grass-feeds, and afterwards harrow them in.” It is said the advantage has appeared to great, that he has been induced to sow the corn on his plantations by means of the drill.

A practical implement of this sort has been lately patented by Mr. Waiteell, which he denominates a horse-hoe. In this tool, by combining the powers of the hoe and harrow, a convenient and useful mechanism is afforded for working the intervals of drilled turnips, and other crops, that have sufficient widths in the rows for admitting its action. Its various uses are, that it enables the farmer to cultivate those intervals as completely as a well- wrought fallow, so long as the horse can travel therein without injury to the growing crop. It is not ascertained who was the original inventor of this tool, but the first Mr. Waiteell gave was at Welf Park, in the vicinity of Barnard Castle. That in his possession was brought from Carlisle, and great numbers have been since made from it. They answer perfectly for turnip crops, sown at twenty-seven inches distance in the rows, and are greatly in use for that sort of culture.

There are still a great many other sorts of horse-hoes, but it is not necessary to take notice of them in this place, as they will be considered in sketching the operations which they are particularly calculated to serve.

Hoés of these several kinds may be seen by consulting the figures in the plate belonging to this article.

Hoes, or hoeing, the common name of an useful and well-known garden implement.

These tools are of different kinds, as drawing and stuffing, each of which has different sizes or dimensions.

The first sort is fixed with its edge inclining a little inward; the workman, in using it, drawing it towards him. It is one of the most useful implements of gardening for many purposes, both for general hoeing, and in drills for sowing many sorts of seeds, loosening the earth about the plants, and moulding up the stems of them, as well as hoeing down weeds between all sorts of plants that stand distant enough to admit it. It is the kind adapted to any kind for thinning out cuttled crops to proper distances, to acquire their proper growth, such as onions, carrots, parsnips, turnips, fennel, &c. And of this kind there should be three or four different sizes, from six inches width down to two inches, or less.

The first size is a large hoe for common use, about six inches long in the plate, by three or four broad, fixed on a
long handle for both hands, and is the proper sort to use for all common hoeing work, and for drawing drills for fowling peas, beans, kidney-beans, &c. It is the most eligible fixed hoe of any for broad-hoeing, between rows of all those kinds of plants, and all others that flourish daintily, either in rows or otherwise, for the hoe to pass between them, both to cut down weeds and loosen the ground, and to earth up the items of the plants, and for all other purposes of hoeing where the plants stand daintily, both in the kitchen and pleasure-garden.

The second size should be about four inches in the plate longways, and the same breadth as the above. It is useful for drawing drills, and for hoeing among various plants, where the former sort of hoe cannot be commodiously employed; as well as to thin some sorts of succulent crops that require moderate distances, such as Dutch turnips, general crops of carrots, parsnips, &c. It is also a proper fixed hoe for hoeing common flower-beds and borders, &c. in most instances.

The third size should be two inches and a half, or not more than three inches broad in the plate; and it should be fixed on a short handle to use with one hand in small hoeing, thinning out several sorts of succulent crops, and other work among close-growing plants. A smaller one should also be fixed on a longer handle, to use two-handed in hoeing borders, and other compartments of smaller plants standing near together, both in the kitchen-ground, flower-garden, &c. This fixed hoe, on a short one-handed handle, is likewise particularly useful for small-hoeing, moulding, and thinning out many kitchen-garden crops in young growth, such as onions, leeks, carrots, parsnips, fennel, &c. to cut them out to the proper distances. It is also a very convenient size for use on many other occasions of hoeing; and for drawing small drills for fowling many kinds of seeds, and hoeing up flower-beds, &c. where the larger hoes cannot be readily admitted between the plants, so as to stir the mould effectually about them.

The fourth size should be about two inches wide, and fixed in a short handle. It is proper for small-hoeing onions and small crops of carrots, radishes, &c. the first time where they stand pretty close, and where it is not designed to thin them out at once to their full distance, but to leave them rather thickish for cutting, &c.

The edges of the hoes should constantly be kept sharp by occasional grinding, that they may cut clean and freely.

The second sort, or scuffling-hoe, is commonly called a Dutch-hoe. It is fixed with the edge outward, on the end of a long handle, so as that the person using it may push it from him going backward, and never treading on the hoe-ground, as with the drawing-hoe. In regard to size, it should be from about four to six inches wide, open in the middle, for the mould and weeds to pass through, so as not to be drawn in heaps; having a long socket at the back part, in which to fix the handle, which may be five or six feet in length.

This is very proper for scuffling over any piece of ground to destroy weeds, that is clear from crops, or between crops or between hedges, with which a person may make considerably more expeditious work than with a drawing hoe, especially when the weeds are not suffered to grow large; in which case, one man can often do as much as two with the other sort. It is not proper for hoeing out crops of succulent plants, or for earthing up the items of plants, nor for hoeing where the plants stand close. But it is very useful for cutting down weeds in shrubberies and wilderness quarters, where the shrubs stand daintily from one another. And it is the best sort of any for scuffling over sand-walks, or others made of loose materials, in order to destroy weeds, moss, &c.

When of a small size, it is also found useful to run over flower borders, to cut up straggling weeds; as, being fixed on a long handle, the work may be effected by standing in the walks, without treading on the borders or walks, and thereby doing injury.

There is also a sort of triangular hoe, which has been lately found very useful in hoeing many sorts of small crops that stand rather close.

HOEDIC, in Geography, a small French island in the English channel, near the coast of the department of Morbihan; about 9 miles E. of Belle-ile, and 12 S.E. from the peninsula of Quiberon; on it are a town and village of the same name, and a fort. In 1756, this island was taken by the British. N. lat. 47° 41'. E. long. 2° 46'.

HOEING, in Agriculture, the work of breaking down, dividing, and rendering the particles of the mould or soil fine, by the use of tools contrived for the purpose, between the rows of drilled grain crops, or those of other sorts, set in rows at still further distances.

It is one of the most useful and important processes, where crops are sown or set in the drill or row method, and which should constantly be well attended to, and executed.

The advantages of the hoe culture are, in general, considered to be extremely numerous; it completely destroys weeds; increases the means of the plants supplying themselves with food, greatly promotes the fertility of the land; forwards the process of vegetation; and leaves the soil in a great part prepared for succeeding crops. As rain, snow, and dews are capable of being taken up with avidity by the mould of the soil, while it is preferred in a loofe, porous, and open condition, though in the contrary state, or that of its being in a hard-bound, firm situation, they seldom reach much below the surface, being speedily again taken up into the atmosphere by the effects of the sun and wind, producing little or no benefit; the work of hoeing must obviously, in this point of view, be of great utility. And accordingly it is found highly efficacious on strong, stiff, loamy sorts of land; while in those of a very light open texture it is often hurtful, by suffuring the moisture and other chalybeate matters to escape too freely, when too much employed.

In conducting the work of hoeing, the ground should be in a medium state of dryness. Light dry soils are mostly capable of being hoed at any season; but such as are of an adhesive compact quality, can only be hoed with benefit, at particular periods, when the mould of them is in a loose friable situation.

In the hoeing processes, it is necessary to execute the business in different ways, according to the nature and circumstances of the land. Upon the more stiff, heavy, loamy sorts of soil, which are very apt to produce abundance of weeds, it will be found necessary to repeat it more frequently than on others of the more light and open descriptions. The hoes should likewise be heavier, and the shares stronger, for the former than the latter. In grain, and small seed crops, when drilled at narrow distances, the work of hoeing should be performed by means of small shares that bear a due proportion to the width between the rows. But for other larger sorts of crops that are drilled or set at much wider distances, larger and stronger tools are proper.

Many farmers are of opinion that hoeing is greatly more beneficial when executed with hard hoes, than any of those of the hand kind, from their loosen ing the soil more deeply,
and thereby providing more nourishment for the use of the crops. Hence, it is supposed, arises the vast importance of the operation of horse-hoeing, during continued drought in the spring or summer; and to this cause, in a great part at least, it may probably be owing that lucern, usually sowed and horse-hoe'd, is liable to endure drought so much better than natural grasses, and to appear green and flourishing whilst these are withered and burnt up. The almost instantaneous benefit conferred by this operation, upon cabbages, which are root-bound from a baked soil, or upon wheat which appears yellow and sickly in the spring, is its best recommendation." Thee crops may, it is said, "be seen, after being worked in the rows, from a withered sickly hue, and flagging condition, turn erect, and change their colour to a deep and flourishing green within twenty-four hours. Nay, of such importance is the operation of deep and effectual hoeing held by experienced people, that a Kentish farmer has been known, in a time of great drought, to send his men with their spades into the alleys of peas, being afraid of damage from horse-work."

With regard to the number of hoeings that may be necessary for different sorts of crops under the drill system, it must of course vary greatly according to the particular circumstances of the different cases. It is usually, however, about three, four, or even five, in remarkable instances. But it is chiefly to be regulated by the disposition of the land to throw up weeds, where this is considerable, more hoeings will consequently be required, as no weeds should ever be allowed to rise.

In respect to the proper periods of hoeing, there is considerable diversity of opinion, especially as to grain crops, and those of some other kinds. In wheat, when snow sufficiently early to admit of the work being done in the autumn, the first hoeing is advised never to be executed until the plant has acquired more than one blade, and it may be delayed till it has four or five leaves, in case that no particular occasion for it is seen, and that it be performed before the winter sets in.

The method of hoeing is differently executed in different cases. The author of the horse-hoeing husbandry recommends, that the first operation should be performed from the rows of the plants, in one bout of the machine, by which means a ridge is left in the middle of the interval, and a furrow or channel on each side of it, having the row of plants between, by which the snow and rains are caught in the winter, and much benefit thereby produced, as well as by the greatest possible surface of the soil being exposed to the influence of the atmosphere. It has been contended by the above writer, that, for the first time, the work can scarcely be done to too great a depth, or too near to the rows, provided that the plants are not injured, or rooted up, as by laying the roots almost bare in this way, and exposing them to the action of the frosts, no sort of harm is inflamed by them. This is, however, a practice, the utility of which may be jujtly disputed, as it is more natural to suppose that benefit may be derived from the mould being filled and laid to the items of the plants, than by exposure during the rigours of such feasons. And it is even admitted, that much caution is necessary in approaching the rows of plants, in performing this sort of work on very light soils. It is also urged, as a common fault among workmen employing the hoe plough, that they merely skim up and down the middle of the divarications between the rows without going sufficiently near them, or sufficiently deep; and it is advised, as a great improvement of the custom, to trench or draw another furrow to a proper depth, if practicable, immediately, or otherwise before the ridge be turned back in the spring. In this way the plants are left, as it were, on the brink of a trench, by which means they are protected against dry and free from flagrant moisture, being, at the same time, sheltered by the ridge thrown up in the alley.

In using the drill husbandry on strong soils, there may often be danger in prolonging the first horse-hoeing to too late a period, on account of the ground being apt to become too moist for performing the business in an effectual manner.

The work of horse-hoeing in the spring may be begun as soon as the frosts are out of the ground, and the surface mould is sufficiently firm to support the animals without injury in its execution; the ridges between the rows are now to be divided and turned back, the finely reduced mould from the action and influence of frost and snow being laid to the roots of the plants, by which an abundant supply of nutritious matter is taken up. It is not believed that even the smallest injury is done to the roots, by the breaking and tearing of the innumerable threads and filaments which branch out on every side, as nature, in a very short time, not only remedies the mischief, but provides aborning mouths in proportion to the furnish of nourishment that is made. It is suggested that the farmer must constantly be the judge of the necessity for light harrowing and rolling, before the work of spring-hoeing the rows is begun.

The number and distances of the foregoing horse-hoeings must, in a great measure, be governed by the circumstances of the land, and the convenience of the cultivator, but they have chiefly two objects in view; first, that of turning in the weeds the moment they are in the proper condition; and secondly, that of moving the surface mould before it becomes too much baked, and impervious to the dew; the latter of these points must be carefully attended to in dry parching feasons, as the weight of the crop depends greatly upon it. The advantages of the drill system are here likewise clearly evident. There may be a still further necessity for an additional tilling, in such soils as are much exhausted or impoverished, arising from the crops having taken up the chief of the nourishment which was provided by the former hoeings, consequently a new earthing up of fresh mould near the period of their coming to perfection may be of great service. It is conceived that flight hoe-ploughing can never be in the least injurious, at whatever season it may be executed; but deep working in this way should never be permitted near the rows of the plants either in the spring or the summer months. However, the middle part of wide intervals may be wrought to a good depth, as, in this case, the plants are left well earthed up at the last hoeing.

In respect to the modes of executing the work of horse-hoeing, it is hinted, that "the old method of very wide intervals for the horse-hoe, whilst the seven-inch rows, under the ridges were trenched entirely to the operation of the handhoe, seems now to be exploded, and to have given way to the improvement of horse-hoeing the rows in a considerable number at one time." It is probable that this expedient method was first introduced by Ellis and Ducket. The superiority of such a practice over hand labour cannot be disputed; but when had recourse to on strong rough lands, its powers may be questioned with propriety, and a preference be jujly given to the regular and effective working of the hoe-plough. Upon such clayey grounds, deep and effectual pulverization is of great consequence, flight surface working producing but little benefit, the earth below being left in a hard
Hoeing.

The work of horse-hoeing must, however, in a great measure, be regulated, in all cases, by the circumstances of the soils, and the particular modes of drill-fowing that may have been employed.

It is stated by a late able writer, that "early in March Mr. Coke uses the hand-hoe, which, for hoeing the rows of wheat and peas, is about six inches wide; and for hoeing those of barley, about four inches wide. By this hoe, the surface is not only turned over, and the weeds between the rows rooted up, but the mould is also accumulated about the roots of the growing corn, and covers, and consequently destroys, the low growth of poppies amongst them, which are a very frequent weed in that part of the country." A second hoeing is performed about the middle of May, and the foil is again not only cleared from weeds, but accumulated against the rising corn, each of which hoeings cost about twenty pence per acre. Nevertheless, it is suggested, that some attentive agriculturists use the horse-hoe belonging to Mr. Cook's drill machine, though the rows of corn are but nine inches from each other; and assert that this occasional trampling of the horse on the young plants is of no very ill consequence, a circumstance well worth observing, as it removes the principal disadvantage of the horse-hoe, which confits in the too great disarrangement of the alternate rows of the corn plants." It is further stated, that "by the earth being thus accumulated against the roots of the corn, it is laid to tillure, or cellure, much; that is, to throw out four or six items, or more, around the original item, and thus to increase the number of ears, like transplanting the roots; infomuch that Mr. Coke obtains by this method between four and five quarters of wheat on every acre, which, in the broad-cast, did not yield more than three quarters an acre, besides faving a strike and a half of the feed corn, unnecessarily confumed in the broad-cast method of fowing. To this should be added another advantage, that as the land is thus kept, clear from weeds, and has its surface twice turned over, and thus exposed to the air, it is found to fave one ploughing for the purpose of a succeeding crop of turnips." But whether this tilluring of the plants may be really beneficil, without hurting their roots by too much exhaustion, has not been hitherto satisfactorily fhewn.

A late writer, who objects to the process of hoeing, as practiced by Tull, Chateauneuf, and others, as being very imperfect, by leaving the roots of the plants too much exposed and subject to the effects of the drying summer winds, as well as various other causes, in the first operation of the busineses, supposes, that all the different proceedes of horfe-hoeing may be performed in an equally effectual manner, by the common fwing-plough, as by any of the hoe-ploughs, which are generally employed. The mode of using the fwing-plough in this fort of work, is described and explained in the second volume of "Recreations in Agriculture," at considerable length, with a plate.

But notwithstanding the safe, convenience, neatness, and difficulty with which the work of hoeing may be executed, either by means of ploughs of the common hoe or fwing descriptions in such forts of crops as fland in need of wide intervals, as thofe of potatoes, cabbages, beans, and others, which are fimilar in their nature and habits of growth, they are not by any means properly adapted for executing the busineses in such crops as are put into the ground at narrow distances, as thofe of the grain kind. In thofe cafes, fuch hoe machines as work between many different rows at the fame time, are commonly found the moft proper and convenient.

Other implements, such as thofe of the cultivating and fcarifying kinds, may be had recourse to with much advantage, in many cafes, in the early spring, in the view of loosening and ftrifying the earth about the roots of thofe forts of crops. It has been flated by a writer on drill husbandry, that in performing the work of hoeing in wheat crops, as that plant has two forts of roots, namely, the fummi and the coronal, the latter of which rarely fows itself until towards the end of March, or the beginning of the following month, that is the proper period for aiding the efforts of nature; which is advised to be done by means of passing over the field with a pair of light harrows, and in this way not only destroying the weeds, but affording an earthing-up to the coronal roots of the plants. As soon as this harrowing has been executed, a roller fhould be immediately paffed over the field, in order to render the soil firm about the roots of the crop, as well as to prepare for a fcond hoeing; but this receds may not be necessary except in the more light kinds of foils. About the beginning of May, and sometimes sooner, it is suggested, that the fcond hoeing should be undertaken by the use of the fix-sharped horse-hoe or the breach-hoe. This fhould be performed only once, when a time, and is of course very inferior to the former; which performs the work on fir or seven, according to the dilances at which the crops are feen. When this falt fort of hoe is employed, the feed box, &c. should be wholly removed, nothing being left but the mere frame of the drill machine, to the couler bar of which the hoes fhould be attached. And in the execution of the work, the horse fhould pafs exactly in the fame track in which it went in drilling the feed, one hoe lefs than the number of rows drilled being made use of; that interval between the breadth of the drill implement being hoed by the hand, on account of its being unequal from the unfeedines of the horfe; and by the workman who manages the machine keeping his eye constantly on one of the hoes, fo as to preferve it in the middle of the interval, the reif mut with certainty be perfectly right in their direction. In cafes where the labourer who directs the hoes wants to move them to the right or left, fo as to keep them in the middle of the intervals, he fhould lift up the handles in a flight degree at the time he moves them. But it makes no material difference, whether the coulers or hoes be used or not, as the manner of regulating them is equally the fame, and the directions that have been given for the use of the hoes are equally applicable to the use of the coulers in this hoe machine.

The third hoeing is directed to be had recourse to about the latter end of May, or the beginning of the following month, as at that season it greatly invigorates the coronal roots of the plants, and at the fame time promotes the growth of the items or flalks.

And where a fourth hoeing is found requisite, it should be performed about the end of June, or in the beginning of the fucceeding month, according to the circumstances of the cafe. However, as there are considerable variations in the foils and seasons, it is suggested as impossible to afceint with precision the exact period when the work fhould be performed. Confequently, much muft be left to the judgment and discretion of the farmer; but weeds fhould in no infance be fuffered to become predominant, as thereby much injury muft necessarily be fultan in the crops.

When drilled crops of the wheaten kind are hoed by the hand method, which should perhaps be only managed in this way; it is fuppofed by some that the work fhould be executed,
HOEING.

executed, as soon after the plants are up as possible, by two-inch hoes.

In the execution of this sort of work, on crops of the barley kind, as there are likewise two sets of roots, of a similar nature to those in wheat, as the seminal and coronal, the latter of which is formed about three weeks after the sowing of the feed, it is suggested that upon the appearance of this root, the field should be harrowed, and afterwards rolled, in order to prepare it for the first hoeing process, and that the second and third hoeings should be had recourse to at proper distances of time, being executed exactly in the same way as has been already directed for conducting the work in crops of the wheat kind.

In managing the work in oat crops, it is advised, that as soon as the coronal roots begin to show themselves, the field should be harrowed and rolled as above for the first operation of the hoe. And that the second and third hoeings, in cases where they may be requisite, should be performed in proper times afterwards, and in the same method as has been directed for crops of wheat.

It has, however, been shown that the work of hoeing is capable of being effected in a very exact and perfect manner, without the necessity of having recourse to the use of hand hoes at all in any of these kinds of grain crops, by means of the improved horse-hoe of Mr. Cook. See Hoe.

But in drilled crops of wheat as well as barley, it is the advice of many good cultivators to have the work performed as soon as any weeds make their appearance, whether the horse or hand method is had recourse to for the purpose.

And in cases of this nature, the hoes should constantly be of the same sizes with the drills, that injury may be more effectually guarded against. In these instances the work may frequently be executed by means of one horse fixed to a yoke that does the business on four or five rows at the same time, a workman directing it behind by means of the handles.

In the work of horse-hoeing bean and pea crops, the writer of the farm system of "Drill-husbandry" recommends, that as soon as the plants can be fully disinguised in the rows, they should be harrowed over and rolled in order to complete them for the first operation of the hoe. And that in cases where the soil is mellow in its nature, the expanding horse-hoe should be employed about the middle of May, at which time the beans or peas will be sufficiently established in the ground, so as to be injured by the free use of the tool; the flowers being kept perfectly firm, so as to cut the weeds with facility, in order that the expanding harrow may bring them more completely to the surface, and thus finish the second process of the hoe. The crops may then remain three or four weeks, or until more weeds appear to be thrown up, when they should be skim-hoed a second time, which completes the business of the third hoeing. But in the course of some days afterwards, the rows should be hand-hoed in a perfect manner, and then well earthed up, which concludes the work of the fourth hoeing. Two or three weeks after this they should be again hand-weeded, and then earthed up the second time, which finishes the business of hoeing that is usually found necessary. It is advised, however, that if the soil should be of a light, gravelly, or stony nature, the hoe-plough should be had recourse to in the second hoeing, ploughing a furrow off from the beans on each side, in order to make a ridge in the intervals between the rows; by which means they will then stand upon a ridge of about six inches in width, which will help to barrow down. About a week afterwards, the double mould boarded plough should be employed, to earth up the plants in the rows. And in two or three weeks they should be again hand-weeded, being checked up a second time by the double mould boarded plough as soon as the weeds are seen, which mostly terminates the work of hoeing in such crops.

In the business of hand-hoeing crops of this sort, ten-inch hoes are among the most proper, the mould in the second proceeding being brought up to the roots of the plants, upon which, especially in peas, they should be made to rest in an inclining position, so as to afford a more complete exposure to the influence of the sun and atmosphere.

In the work of hoeing drilled turnip crops, it is suggested that, as soon as they have got four vigorous rough leaves, they should be harrowed with a pair of light harrows, and in two or three weeks afterwards the second hoeing should be given, either by the brcail, or fixed-shanked horse-hoe, in order to cut up the weeds in the intervals, but such weeds as are in or near the rows should be extirpated by the hand-hoe, the turnips being thinned out at the same time. The third hoeing may be had recourse to in two or three weeks after this, with the same fort of hoes, the rows being also well hand-hoed, and the turnips set out to their proper distances. And it is hinted that this method of turnip hoeing is equally applicable to the hoeing of cole, with the exception of the harrowing, which should be wholly omitted.

It is advised by many to give the first hand-hoeing in the more early turnip crops, as soon as the leaves spread about four inches each way; repeating the operation at the distance of about a fortnight, so as to leave the plants about twelve inches apart; but in the later crops, the nature and quality of the land should be well considered, and the distance regulated accordingly; however, eight or nine inches are quite sufficient in general.

In carrot crops the method of hoeing is, as soon as the plants are from two to three inches above the ground, to have them harrowed over by a number of harrows fastened together by a pole, so as to be capable of covering the ridge, the hoes being made to walk in the furrows, in order to prevent treading the ground, or doing injury to the young plants. In two or three weeks after the harrowing, the second hoeing should be given to clear the intervals of weeds, such as are in or near the plants in the rows should be cut up with the hand-hoe, and the plants thinned out at the same time. The crop may remain for two or three weeks in this state, or until weeds begin again to appear. The hoes should then be again employed, the breast or horse-hoe to clear the intervals, and the hand-hoe for the rows; and where any double carrots are left, they should be taken away, and such plants as are to stand for the crop set out to their proper distances. In the execution of the work in carrot and turnip crops, the four-inch hoe is preferred by some for the latter, and the three-inch for the former, the plants being left in the first hoeing at such a distance as may seem requisite; and in the second setting them out to that of from three to five or six inches distance, according to the nature of the soil.

In the business of hoeing potatoe crops, it has been suggested that, as they are in general set upon light mellow soils, the expanding horse-hoe is well suited to their culture. It has the properties of being expeditions, effectual, and cheap in the execution of the work. The hoeing in this crop may, however, be well performed by the use of the hoe-plough, or indeed any common fowing plough, as already noticed. It is advised, that as soon as the plants are fairly above the ground, they should be harrowed once over in a place as a preparation for the first hoeing; and that is about two weeks afterwards they should be skim-hoed for the second operation, and in two or three weeks more again harrowed; the expanding harrow being constantly employed to drag
drag the weeds out of the ground after they have been cut up by the hoe. Directly after the second firm-hoeing they should be well hand-hoed in the rows; and as soon as the weeds are dead, and in some measure decayed, the plants in the rows should be earthed up well by the same tool properly prepared for the purpose. See Hoe.

When more weeds begin to show themselves, but before the potatoes begin to sprout too much, they should be hand-weeded in the rows, and then earthed up a second time. When more weeds appear, and seem likely to run into seed before the potatoes are taken up, they ought to be pulled up by the hand, and conveyed from the field, or laid in heaps and consumed by fire, or formed into an earthy compost by means of caustic lime, and rich mould.

In the hoeing of this sort of crop others advise the use of eight or ten-inch hoes, as the land is more or less stony; in the first operation drawing up the mould so as to cover the roots and prevent their rising above the surface; afterwards earthing them up with the mould from between the rows of the plants.

In hoeing cabbage crops, it is suggested, that as the month of May is the principal season for planting them to stand the winter, the work should be finished at that time; and that in about three or four weeks after they have been planted out, the hoe-plough should be had recourse to, ploughing off a furrow from the rows of cabbages on each side, so as to form a fort of ridge in the intervals; the cabbages being left upon a flat ridge of six or eight inches in breadth. These ridges should be well hand-iced, and the mould brought up well to the plants at the same time. When the work of hand-hoeing has been completed, the expanding harrow may be made use of in order to harrow the ridges in the intervals, by which the weeds are destroyed, and left upon the surface to decay.

Ten or twelve days after this harrowing has been done, the hoe-plough may again be had recourse to, in order to turn back the mould to the roots of the cabbage plants, on each side of the rows: and in about a fortnight after this earthing up, the bottoms of the intervals should be cleared up by the horse-hoe or the hoe-plough, which has not only a very pleasing effect, but is highly useful to the crop. It should likewise be repeated a second time when the weeds begin to show themselves, before the cabbages spread so as to prevent the hoar-frost from forming in the intervals without injury. Where additional weeds are thrown up, they may be removed by hand labour, and any injurious insects that may be present at the same time destroyed. The hoe-plough, or common swing-plough, answers here perfectly for the purpose of hoeing.

Where the hand mode is had recourse to in executing the work of hoeing, a three-inch hoe is commonly first employed, and in the course of the fortnight or three weeks afterwards a four-inch hoe; after that the plants being usually drawn out, and planted so as to give the most suitable distances according to the condition of the soil.

Although both the hand and horse method of hoeing crops must frequently become necessary, it is evident that the latter has considerable superiority in point of cheapness, convenience, and the effective manner of executing the work. See the culture of the different grain, root, and other crops, under their proper heads.

Hoeing, in Gardening, a necessary operation performed by the hoe, to destroy weeds, loosen the soil, and mould up the flails or stems of plants of different kinds, and thereby promote their growth.

It is an expeditious method of destroying weeds between all sorts of plants that stand distant enough to admit it in the intervals and rows.

When principally designed to destroy weeds, it should always be performed to some depth, and in dry weather, the more the better. Especially when the weeds are not to be raked off, that they may die as soon as they are cut down, or at least be so much flagged or withered by the sun and air as not to grow again.

This sort of work, besides destroying weeds, is likewise useful in loofening the surface and disclosing the earth to receive the greater benefit from the air, dews, rains, &c. to the great nourishment of all sorts of plants, and, by breaking up the surface, dividing the clods, and flirring the earth, keeping it fresh and proving a very beneficial culture to all vegetables. In soils apt to bind after much wet, which causes the plants to appear of a flinted growth, hoeing is of vast advantage in promoting their immediate growth and future progress.

The application of earth about the stems of plants, such as earthing up rows of peas, beans, kidney-beans, cabbages, cauliflowers, &c. is constantly of great service in protecting the strength and vigour of the crops, as well as in giving them a neat appearance.

It is also beneficial in thinning out many close-flattening crops to proper distances, cutting out the super-abundant plants and the weeds, and loosening the soil in an advantageous manner. See the particular crops.

HOEI-TCHEOU, in Geography, the most southern city of the province of Kiang-nan, in China. It is one of the richest cities in the empire; the people are economical and temperate, but they are active and enterprising in trade. Their tea, varnish, and engravings, are the most esteemed in China. It has six cities of the third class dependent upon it; and the mountains which surround this canton contain gold, silver, and copper mines. N. lat. 29° 57'. E. long. 118° 14'.—Allo, a city of China, of the first rank, in Quang-tong, celebrated for the fertility of the country round it, and its extensive trade. Its jurisdiction comprehends 11 cities of the second and third class. N. lat. 25° 1'. E. long. 114°.

HOEMAH, a town on the S. coast of the island of Bouro. S. lat. 3° 50'. E. long. 127° 22'.

HOENFURST, a town of Pruffia, in the circle of Natzangen; 26 miles S. of Brandenburg.

HOENSEN, a town of Pruffia, in the circle of Samland; 12 miles E. E. of Goldap.

HOEREA, a town of European Turkey, in the Morea; 27 miles N.W. of Miletus.

HOEROMSK, a town in Norway, in the diocese of Aggerhusen; 16 miles S.S.W. of Christiania.

HOESSERING, a town of Welfphalia, in the principality of Luneburg-Zelle, situated on the Hardan; 22 miles N.E. of Zelle.

HOET, GERALD, in Biography, born at Bommel in 1648, and was a disciple of Wannard van Ryten, an excellent painter, who had been bred in the school of Podeburg; but his genius soon exerted itself in such a manner, that he was enabled to proceed happily in his profession, without being indebted to any instructor.

When he commenced artist, he was at first invited to Cleve, where his paintings procured him very great credit; but he was afterwards prevailed on to visit France; yet in that kingdom he had not the good fortune to meet with encouragement in any degree proportioned to his merit; and hence he turned his attention to England, where his talent certainly would have dectected his course, had he not been dissuaded by Volckerman, who at that time was preparing to

leave

HOF

leave the court of London. At last he settled at Utrecht, and in that city and its neighbourhood found a sufficient number of admirers and friends who constantly employed his pencil; and afforded him continual opportunities to display his abilities, in executing several grand and beautiful designs for ceilings, foyers, and superb apartments and also in finishing a great number of easel pictures for their cabinets.

The reputation of Hoet, for knowledge and skill in his profession, was so universally established at Utrecht, that he was appointed director of an academy for drawing and painting, which he conducted with great honour to himself, and remarkable advantage to his pupils. He had a lively imagination, a very ready invention, and a fine genius for composition; as also a nice adherence to the costume. His manner of painting was clean and neat, and he was thoroughly master of the true principles of the chiaro-furo. His figures in general are designed with elegance, and drawn with correctness; his colouring is lively, natural, and full of harmony, from the judicious opposition of his light and shadow; his touch is light and firm, and his pictures have a great deal of tranparency. His small easel paintings are exceedingly delicate in the touch and the finishing; and yet his larger works are always pencilled with a freedom that is suitable to those grander compositions.

Many capital pictures of this master are in the palace of Slaugenburg; and his eminent talents may be seen in the grand初衷-caffe at Voorh, the seat of the earl of Albemarle. In Holland, and also in our kingdoms, several charming pictures of Hoet are preferred; some of them in the manner of Poussin, and others in the style of Dore du Jardin. He died in 1733, aged 83.

HOF, or HOFF, in Geography, formerly imperial, a town of Germany, in the principality of Culmbach, on the Saale, by which it is divided into the Old and New Town. It has three fairhouses, four churches, an academy, and a woollen manufacture. In its environs are quarries of marble, red, black, and grey, some of the latter being marked with red spots like blood; 46 miles N.E. of Bamberg. N. lat. 50° 18'. E. long. 12° 50'.—Alto, a town of Norway, in the diocese of Aggerhus; 36 miles N. of Bergen.

HOE, a town of Moravia, in the circle of Olmutz; 18 miles N.E. of Olmutz. N. lat. 49° 46'. E. long. 17° 27'.—Alto, a town of Prussia, in the province of Nattengen; four miles S. of Landberg.

HOEHEIN, a town of the duchy of Wurzburg; 36 miles N.E. of Wurzburg.

HOFFKRICHEN, a town of Austria; 10 miles S. of Aigen.

HOFFLITZ, a town of Bohemia, in the circle of Leitmeritz; five miles S.E. of Tetschen.

HOFFMAN, in Biography, an excellent composer of instrumental music, particularly symphonies, was maestro di cappella in the cathedral of St. Stephen at Vienna in 1772, and a master much esteemed at that time in the imperial capital.

HOFFMANISTS, in Ecclesiastical History, denote those who espoused the sentiments of Daniel Hoffmann, professor of the university of Helmstead, who, from the year 1598, maintained that philosophy was a mortal enemy to religion; and that what was true in philosophy was false in theology. These absurd and pernicious tenets occasioned a warm and extensive controversy; at length Hoffmann was compelled by Julius, duke of Brunswick, to retract his invectives against philosophy, and to acknowledge, in the most open manner, the harmony and union of found philosophy with true and genuine theology.

HOFFMANN, GASPAR, a physician of some eminence about the beginning of the seventeenth century, was a native of Gotha, in Thuringia, where he was born in November, 1572. By the assistance of a friend he was supported during his residence at the most celebrated universities of those times, and graduated at Baile in the year 1605. In 1607, he was appointed professor of the theory of medicine and Altdorf; the duties of which, and of other professorships, he continued to fulfil, with credit and reputation, until his death, which occurred in November, 1648. Gaspar Hoffmann was generally considered by his contemporaries as a man of great erudition, and was author of numerous publications, in which he showed a great attachment to the doctrines of the ancients, especially of Aristotle. His works are not sufficiently interesting, however, to present any enumeration of their titles. Haller considered much of his display of knowledge as spurious; and affirms that, as he wrote upon anatomical subjects without having touched a knife, so he treated copiously on the practice of physic, without having visited the sick. Eloc. Dict. Hift. Haller Bibl. Med. Prat.

HOFFMANN, MAURICE, a physician, anatomist, and botanist, was born at Furthenwald, a small town in the Middle Mark of Brandenburg, in September, 1622. During his early youth, his native country was defoliated by war and pestilence, which compelled his parents to fly from place to place, and interrupted the education of Maurice, whose acquirements did not go beyond the art of writing. Having left his father and mother at the age of sixteen, his ardour for knowledge led him to Altdorf, in 1638, where a maternal uncle was professor of medicine. Here he made a most rapid progress in philosophy and the learned languages, and commenced the study of physic. In 1641 he repaired to the newly established university of Padua, where he was particularly devoted to the study of anatomy and botany. In the former of these sciences he is entitled to the name of a discoverer, if the relation of Bartholin be true; that, while yet a student, he was amusing himself with the dissection of a turkey, and discovered the pancreatic duct, which he showed to the anatomist Wurthung, with whom he lodged at Padua, and who afterwards found it in the human subject, and attributed it to his own name. After a residence of three years in Italy, Hoffmann returned to Altdorf, where he received the doctor's cap in April, 1645, and was soon appointed to a professorship; and from the year 1648 he obtained the extraordinary chair of anatomy and surgery; and in the following year he succeeded Gaspar Hoffmann as ordinary professor of those departments. He likewise was appointed successively to the chairs of Jurgen, in the botanical chair, in 1653. He urged the strong faggottions relative to the necessity of a garden for the culture and demonstration of plants, and was not less strenuous in his representations in favour of the establishement of a laboratory and an anatomical theatre; and it was to his exertions that the university was indebted for these valuable acquisitions. In addition to his academic occupation, he pursued the practice of medicine with considerable fertility; and he obtained such eminence as a practitioner, that several of the German princes honoured him with the title of their physician. In word, his industry in the Closet, his skill and humanity at the bedside of the sick, his eloquence in the chair, and his various social qualities, rendered him worthy of the general estimation in which he was held. He died of apoplexy, on the 24th of April, 1698, in the sixty-seventh year of his age. He had been three times married, and had eighteen children.

Maurice Hoffmann wrote several dissertations on anatomical topics, but his principal works were botanical. Of this subject he published "Flora Altdorffiana Deliciae Hort.
Hoffmann, John Maurice, son of the preceding, was born at Altdorf, in October, 1653. He acquired a knowledge of the learned languages at Herspruck, and studied medicine and philosophy under his father, and subsequently at Frankfort upon the Oder, and at Padua. After a residence of two years in the latter mentioned university, he made the tour of Italy, and returned to his native city, where he was admitted to the degree of M. D. in 1675. His talents and acquirements obtained for him successively the highest honours and offices in the faculty at Altdorf. He began with the professorship extraordinary of anatomy, to which he was appointed in 1677, and in 1681 he became ordinary professor of the same branch. In the following year, the professorship of chemistry was given to him, and he read several courses in the laboratory, with which his father's solicitations had enriched the university. He afterwards undertook the professorship of botany. In 1709, he resigned the anatomical chair, and confined himself to the professorship of the practice of medicine, which he retained as long as he remained at Altdorf. But Hoffmann was not more distinguished by the able performance of his academic duties, than by the successes of his practice; so that he was sought for by persons of the highest rank, and especially by the princes of the house of Anspach. He was appointed physician to the marquis of Anspach in 1693, and accompanied him to a journey to Italy; and after the death of this patron, in 1703, he found the fame kindliness from his successor, who pressed him earnestly to remove to Anspach. But it was not until the year 1713, that Hoffmann could be prevailed upon to quit his academic duties: in that year he fixed himself at Anspach, where he died in October, 1727, at the age of seventy-four. He left several works of repute: viz. two dissertations on anatomy and physiology; one on what has since been called morbid anatomy, entitled "Difficultia corporis humani Anatomico-Pathologicae," ibid. 1713. "Acta Laboratorii chemici Altdorfi," 1719. "Syntagma Pathologicotherapeuticum," 1728, in two vols. 4to, and "Scientia Institutionum Medicarum," a posthumous publication. He also continued his father's "Flores Altdorfae." See Hutchinson Biographia Medica. Eloy. Dict. Hist. de la Medecine.

Hoffmann, Frederic, the most eminent physician of his name, was born at Halle, in Saxony, on the 19th of February, 1660. He received his early education in his native town, and had made great progress in philosophy and the mathematics, when, at the age of fifteen, he left his father and mother during the prevalence of an epidemic disease. In 1679 he commenced the study of medicine at Jena, and in the following year attended the chemical lectures of Caspar Cramer, at Erfurt; and, on his return to Jena, received the degree of M. D. in February 1681. In the year 1682 he published an excellent tract "De Cinambari Antimonii," which gained him great applause, and a crowd of pupils to a course of chemical lectures, which he delivered there. At the conclusion of this course, he was induced to visit Minden, in Westphalia, on the invitation of a relation, and practised his profession there for two years with considerable success. He then travelled into Holland and thence to England, where he was received with distinction by men of science, and particularly by Paul Hermann, the botanist in the former, and Robert Boyle in the latter. On his return to Minden, in 1687, he was made physician to the garrison there, and in the following year was honoured by Frederic William, elector of Brandenburg, with the appointments of physician to his own person, and to the whole principality of Minden. Nevertheless he quitted that city in 1688, in consequence of an invitation, which his rising reputation procured him, to settle at Halberstadt, in Lower Saxony, as public physician. His fame continued to extend, and he published a treatise "De insufficientia aciditatis et vicietatis," by which he overthrew the system of Cornelius Bontekoe. In 1689 he married the only daughter of Andrew Herfeli, an eminent apothecary, with whom he had lived forty-eight years in perfect union, when she died. About this time, Frederic III., afterwards first king of Prussia, founded the university of Halle; and in 1693 Hoffmann was appointed primary professor of medicine, and composed the features of that institution. As a colleague in the medical professorship he recommended the celebrated Stahl, who proved the great rival of his fame as a teacher. He was most active in the exercise of his professional duties; and while he introduced a spirit of free and enlarged inquiry into the new university, he extended its fame and elevated its character, by the eloquence and profound information displayed in his lectures. At the same time his own reputation was spread abroad by the learned works which he published, and procured him admission into the scientific societies at Berlin, Peterburg, and London, as well as the honour of being consulted by persons of the highest rank. He was called upon to visit many of the German courts in his capacity of physician, and received honours from several princes; from whom he received ample remuneration in proportion to the rank of his patients; while others have asserted that he took no fees, but contented himself with his stipends. Halberstadt is under his acquired great wealth by various chemical nostrums which he vended. In 1703 he accompanied some of the Prussian ministers to the Caroline warm bath in Bohemia, on which occasion he examined their nature, and published a Dissertation concerning them. On subsequent visits, he became acquainted with the Schloitz purging waters, which he first introduced to public notice, having published a treatise on them in 1717: and he afterwards extended his enquiries to the other mineral waters of Germany. Among other illustrious patients, who applied to him in these excursions, were the emperor Charles VI. and his empress. In the year 1728, he was called to Berlin to take care of the declining health of Frederic, and was honoured with the titles of arch-chancellor and aulic counsellor, together with a liberal salary. After three years residence at this court he returned to Halle, and gladly resumed his academic functions. He continued also to labour in the composition of his writings; and in 1718, at the age of 63, he began the publication of his "Medicina Rationalis Systematicia," which was received with great applause by the faculty in various parts of Europe, and the completion of which occupied him nearly twenty years. He likewise published two volumes of "Confutazioni," in which he distributed into three "centuries," the most remarkable cases which had occurred to him; and also "Observationum Physico-Chimicarum selectionem Libri tres," 1722. In 1727 he attended the prince of Schwartzenburg through a dangerous disease; in recompense for which his noble patient created him count palatine. He quitted Halle in 1734, in order to pay a short visit to his daughter and son-in-law at Berlin, which, however, was made longer than he intended; for he was detained five months by the king of Prussia.
Prussia, Frederic William, in order to attend him during a dangerous illness, which had attacked him in his camp on the Rhine. During this attendance Hoffmann is said, by dignified remonstrance, to have secured himself against the brutal rudeness with which the monarch treated his other physicians; and he was ultimately treated with great honour, being elevated to the rank of privy counsellor, and presented with a portrait of the king, set in diamonds. His majesty likewise procured the portrait of Hoffmann, from the same painter, which was placed in the palace of Monboujon: and to Hoffmann’s only son he presented a professorship of medicine in the university of Halle, with the title of his confulting physician. Hoffmann declined a prelcing invitation to settle at Berlin, on account of his advanced age, and returned to Halle in April 1735. The illness and death of his beloved wife, in 1737, turned his thoughts to the confulations of religion, and he drew up in Latin a summary of Christian doctrine, which, at the king’s desire, was translated into German. He continued to perform his academical duties until the year 1742, when he died in the month of November, aged eighty-two.

Frederick Hoffmann was an inductious and copious writer. Haller has occupied thirty-eight quarto pages in the enumeration of his works in detail. The principal of these were collected, during the life of the author, by two Geneve book-sellers, and published with his approbation, and with a preface from his pen, in 1740, in six volumes folio. It was re-printed by the same book-sellers, the freres de Tournes, in 1748; and in the following year, having raked together everything which his pen had touched, they published a supplement in three additional volumes folio, which was also re-printed in 1753-4. The writings of Hoffmann contain a great mass of practical matter of considerable value, partly compiled from preceding writers, and partly the result of his own observation; but they contain also many trifling remarks, and not a little hypothetical conjecture, which was indeed a common fault of the times; and in the detail there is considerable prolixity and repetition. As a theorist his suggestions were of great value, and contributed to introduce that revolution in the science of pathology, which subsequent observation has extended and confirmed. His doctrine of atony and sophas in the living solids, by which he referred all internal disorders to some “preternatural affection of the nervous sytem,” rather than to the morbid derangements and qualities of the fluids, first turned the attention of physicians from the mere mechanical and chemical operations of the animal body to those of the primary moving powers of the living sytem. To Hoffmann Dr. Cullen acknowledges the obligations we are under for having first put us into the proper train of investigation; although he himself did not apply his fundamental doctrine so extensively as he might have done, and every where mixed with it a humoral pathology as incorrect and hypothetical as any other. Hoffmann pursued the study of practical chemistry with considerable ardour, and improved the department of pharmacy, by the addition of some mineral preparations; but, on the whole, and especially in his latter years, his practice was cautious and even inert, and he trusted much to vegetable simples. See Eley. Dict. Hist. Vit. Fr. Hoffmannii à J. H. Schultz, and his Epit. to the king of Prussia, both prefixed to the Geneva edition of his works. Gen. Biography. Preface to Cullen’s First Lines.

Hoffmannia, in Botany, so called by Swartz, in honour of several able German botanists of the name of Hoffmann, Mauritius, and his son John George Henry, were successively professors at Altdorf. The former died in 1698, the latter in 1727. They published catalogues of the Altdorf garden; and of the wild plants of that neighbourhood. Frederick Hoffmann, professor at Halle, who died in 1742, aged 82, published various medico-botanical dissertations on Sagar, Cloves, Balsam of Peru, Yarrow, Manna, &c. and in one of them recommended the leaves of Veronica officinalis, as preferable to the tea of China; a doctrine which has made as little progress in the world, as some others better founded in truth. Professor George Francis Hoffmann of Göttingen is particularly distinguished by his descriptive work on Salices, and his splenid Plantae Lichenizes, both in folio; and has also favoured the world with several other botanical writings. He was born in 1760, and is one of the most eminent cryptogamic botanists of the present day.—Swartz. Prodr. 2. Ind. Occ. v. t. 241. t. 5. Schrebar. 708. Wild. Sp. Pl. v. t. 613. Mart. Mill. Dict. v. 2. Clafs and order, Terestridia Monogynia. Nat. Ord. Stellate, Linn. Rubiiaceae, Juff.

Gen. Ch. Cal. Perianth superior, small, of one leaf, with four erect acute teeth. Cor. of one petal, falver-shaped; tube extremely short; limb in four deep, lanceolate, spreading segments. Stam. Filaments none; anthers four, attached to the base of the tube, linear awl-shaped, erect, pressed close to the style. Fil. Gernmen inferior, oblong, quadrangular; style awl-shaped, the length of the filaments; stigma obtuse, downy, scarcely notched. Peric. Capsule oblong, bluntly quadrangular, pulpy, crowned with the calyx, of two cells and two valves. Seeds numerous, roundish, affixed to an ovate distinct receptacle in each cell.

Eff. Ch. Calyx four-toothed. Corolla falver-shaped, in four deep segments. Filaments none; capsule pulpy, with two cells, two valves, and many seeds affixed to distinct ovate receptacles.

Obf. The receptacles, as described by Dr. Swartz, evince the propriety of terming this fruit a pulpy capsule, and not a berry, the latter properly requiring the seeds to be imbedded in pulp, without any distinct receptacles, much less valves.

1. H. pedunculata. Sw. Ind. Occ. v. t. 242. The only species. Found by Swartz in rather moist shady places on the high mountains of Jamaica. The stem is herbaceous, two or three feet long, branched, smooth, rather thrabby at the base; its branches round and hairy. Leaves stalked, opposite, crofing each other in pairs, ovate, pointed, entire; wedge-shaped at the base; above ribbed, shining, rough with elevated points; veiny, pale and hairy beneath. Stipulas opposite, very short, acute, thick and hairy, standing between the foliaries. Flower-stalks axillary, opposite, solitary, longer than the foliaries, many-flowered, lax, hairy. Calyx coloured. Corolla yellowish at the points, tiritated with red, at the bottoms of the segments. Anthers yellow, cohering as in the nightshade, Solanum. Berry scarlet when ripe.

Hoffmark, in Geography, a town of Austria, situated on the river March; 26 miles E.N.E. of Vienna.

Hoffmark, Furtb, a town of Germany, in the margraviate of Anspach, on the Rednitz, peopled with mechanics and artillians; such especially as cannot obtain the freedom of Nuremberg. The Jews are numerous, and have a school and printing- house; five miles N.W. of Nuremberg.

Hoffwa, a town of Sweden, in West Gothland; 89 miles N.E. of Uddevalla.

Hoffhaier, Paul, in Biography, published at Nuremberg, in 1539, a tract in Latin entitled “ Harmoniae Poeticæ,” the second part of which contains a notation of all the rhythms and measures of the feet of Latin verse. This tract is among Anthony Wood’s printed books, in the Ashmole Museum. Paul Hoffhaier is celebrated by Lucinius.

Q 2.
not only as an admirable performer on the organ, on whom the emperor Maximilian conferred great honours, but as a composer of the very first clafs, whose productions, which were not only learned and correct, but florid and pleasing, had remained unrivalled during thirty years.

HOFMAN, Euchorius, published, in 1582, at Strasburg, where he was corrector of the public school, a treatise on the arts or modes of the church, "Doctrina de Tonis, seu Modis Musices." This author, who is a follower of Glaransus, pretends that "the science of the modes, or cantus formosus, which is the most excellent part of music, is but little understood by the moderns; but he draws his information from musicians of the highest authority."

HOFMANSTORP, in Geography, a town of Sweden, in Smaland; 12 miles S.E. of Wexio.

Hog, a town in Sweden, in the province of Helsingland.

—Also, a small island in Pamlico Sound, near the coast of North Carolina. N. lat. 34° 56'. W. long. 76° 36'.—Also, a small island in the Atlantic, near the coast of Virginia. N. lat. 37° 30'. W. long. 75° 42'.—Also, an island on the E. side of lake Champlain, in Franklin county, Vermont; nine miles long, and generally about three miles broad. —Also, an island in Narraganett Bay, Rhode island, about two miles in circumference; two miles from Bridgetown. —Also, an island below Peach island, in Upper Canada, situated in the Strait of D.troit, where it opens into lake St. Clair; containing about 300 acres of land fit for tillage, and a large quantity of marsh or meadow land. It has some wood; the land is low, but fit for pasturage, well improved, and contains in all about 1700 statute acres. —Also, one of the smaller Shetland islands, near the E. coast of Mainland. N. lat. 62° 30'. W. long. 1° 12'. —Also, a small island in the East Indian sea, near the E. coast of Palawan. N. lat. 10° 18'. E. long. 119° 36'. —Also, an island in the East Indian sea, 40 miles long and fix broad; 60 miles W. of Sumatra. N. lat. 2° 35'. E. long. 95° 50'. —Also, an island in the East Indian sea, about 20 miles in circumference. S. lat. 7° 15'. E. long. 114° 53'. —Also, an island in the East Indian sea, 15 miles long and fix broad, near the W. coast of Saleyer. S. lat. 6° 12'. E. long. 120° 15'.

Hog, Cape, a mountaneous headland on the coast of Syria, forming the S. point of the bay of Alexandretta, anciently called the "Rhoium." N. lat. 36° 27'. E. long. 38° 8'.

Hog: Island, a cluster of small islands situated near the coast of the county of Kerry, between Ballinakilleg's bay, and the entrance of Kenmare river, within three or four miles of Hog's Head. There is also a single island called Hog's Head, in the river Shannon, near its mouth.

Hog's Head, a cape of Ireland, on the S.W. coast, forming the eastern boundary of Ballinakilleg bay, in the county of Kerry. N. lat. 51° 44'. W. long. 10° 8'.

Hog, in the Linnean System of Zoology. See Swine.

The common hog, or Sus scrofa of Linneus, is covered with bristles. In a wild state it is of a dark brindled colour, and under the bristles there is a soft curled hair; the ears are short and a little rounded. In its tame state, the ears are long, sharp-pointed, and flouncing; the colour is generally white, sometimes mangled with other colours. The hog, in its wild state, is found in most parts of Europe, except the British isles and the countries north of the Baltic; in Asia, from Syria to the borders of the lake Baikal; in Africa, on the coast of Barbary; and in the forests of South America.

Tame hogs are found universally, except in the frigid zone and Kamtschatka, and such places where the cold is very severe. The Chinese hog is only a variety of the common hog; its belly hangs almost to the ground, its legs are short, its tail reaches to the heels, and the body is generally bare; it is a much cleaner animal than ours. Hogs are frugal and voracious animals; infomuch that they will eat their own offpring, and devour even infants; but it is observed, that the hog is not indiscriminate in the choice of its food; for it has been found to eat 72 species of vegetables, and to reject 171. In America it cleans the country of rattle-snakes, which it eats with safety. Hogs cannot bear excessive cold, and are veryreffilous in high winds.

There are few animals that are useful in a greater variety of ways than hogs. They are extremely prolific; their flesh is agreeable and wholesome food to those who use much exercise; and as it takes salt better than any other kind, it is of great importance to a commercial nation. Hogs furnish brown, and lord, and bristles. (See each article.) In Minorca, the as and the hog are yoked together to plough the land; and the hog has been applied to the same use in our own island, viz. in that part of Murray which lies between the Spey and Elgin. Pennant. See Boar.

These animals are very profitable to the owner in different points of view, especially on some particular kinds of farms, as those of the arable and dairy descriptions. Indeed, on most farms, a few animals of this kind may be kept to great advantage and profit, as preventing the necessary waste of different refuse materials of the food kind, which can only be converted to such uses. These animals are also capable of being kept to great profit in different descriptions of large manufactories where the consumption of grain is extensive; as in those of brewing, distilling, and the making of brick, &c.

The breed of hogs should be constantly well suited to the nature of the farm, and the extent of the keep which is capable of being provided for them, otherwise there may often be considerable lots unfattened. The close, compact, short-legged breeds, which have much disposition to take on flesh, are, in general, to be preferred. But where the keep is good and abundant, breeds which attain a much larger size may sometimes be more beneficial and proper. See Live Stock and Swine.

Hogs are apt to dig up the ground and to break fences; but this may be prevented, by putting rings in their noses, and yokes about their necks. Leicestershire, Northamptonshire, and Hampshire, are famous for these animals, which seems owing to their being clayey countries, and that more peas and beans are sown there than in other places. The wild kind never grow so large as the tame, but they are much better talled. The keepers of hogs should always chuse such boars for the purpose of breeding as are long-bodied, and have deep bellies and sides, short toes, thick thighs, short legs, high claws, a thick neck, and a thin chine; will lift with large bristles. It is not proper to keep too many breeding fows; for they will produce so many young at a time, and this three times a year, that they will not find food enough. They usually bring thirteenth or fourteen young ones in a litter, sometimes more, but they can bring up no more than they have teats to fuckle. Young shotts, as they are called, that is, fowling of three quarters of a year old, are bel for pork, and those of a year and a half for bacon. The male pigs that are reared should be gelt, and the fows spayed; and for this purpose, those which are pigged in the spring are the best. Moilt and feedy grounds are good for fowins, for they eat the roots of many of the plants that grow there; and the fruit of the beeche, chesnut, and hedge-bushes, fatten them well, and make their flesh much better talled than when bred entirely in the flye.

Mr. Young observes, that hogs may be kept in summer, with great advantage to the farmer, in clover fields; and that

lucern
Lucern is superior to clover for this purpose, and that sault-foin is very good; but that burnet is very bad. In winter they may be well maintained with carots, parsnips, beets, and potatoes. The dairy should be appropriated to rearing pigs and feeding fows that have young. It appears, from other experiments of this writer on the fattening quality of several sorts of food for hogs, that pollard alone is a cheaper food than peas alone; that boiled caroets are much the moft profitable; that buck-wheat is more profitable than peas; that several kinds of food mixed are better than any given alone; that the meal of any one, or various kinds of grain, is better and more profitable than the whole grain mixed or alone; and that peas and barley are much sweeter food than beans. The keeping of hogs in any city or market-town is indipitable as a public nuisance.

Hog Ciftern, a contrivance prepared for the purpose of containing and preferring the food employed in the keeping of hogs or swine. This fort of bafon, or cifern, should be formed in such a situation as may be convenient for the kitchen, dairy, and hog-yard, being contrived in such a manner as that there may be no loss sustained in its leaking and letting out the more liquid contents. Into this tub or cifern every thing should be collected from the house, and other places, in order to be formed into walli, or foup, for the more pigs, and thereby no loss be incurred. Where large flocks of hogs are kept, it is a matter of great convenience and utility to have different tubs or ciferns of this nature, that the food may be properly prepared, and in fufficient quantities for constant use, as by this means the food admits of being more suitably mixed and blended together.

The proper contruction of these sorts of receptacles is a matter of very considerable importance; in Norfolk they are chiefly built with bricks and terrace, which is an expensive method of forming them. Wooden vefsels are not by any means either durable or commodious, and those of lead dangerous. Bricks laid in clay are interferted as perfectly watertight, especially when backed by a coat of the fame fubflance. In forming these ciferns, pits or cavities of fuitable dimensions should be dug out, as of five or fix feet in length, and four or five in breadth, having the depths of about five feet. The who'e of the bottom of the cavity should then be well bedded with good clay, well moistened and rammed down, smoothing the surface over neatly with a trowel. Upon this flooring three courses of bricks, laid in mortar made with the bent clay, should be placed, in such a way that the joints of one course may fall in the middle of the bricks of the course under it, the whole being laid lengthways, and not croffed in the ufual method. The fides must be carried up half a brick thick, which is a brick in width, being laid in the mortar of good clay; the vacancy left between the brickwork, and the fides of the cavities being firmly rammed with moif clay, fo as to combine the bricks as much as possible with the clay and the fides of the pits, forming them into a fort of solid body. The brick and clay-work should be carried up equally together, beating back again fuch bricks as may have been forced forward in the ramming of the clay, leaving the surface in the cifern quite even and regular. As, when brought up level with the surface of the ground, ciferns of this nature, of five feet and a half by four, usually measure about three feet in length, and two and a half in depth, the beam or layer of clay on the bottoms and fides must be about four inches in thickness. By way of affording a good covering to ciferns of this kind above the ground, a fort of flanting flood should be contrived over them by building flight brick-walls on each fide of them to the height of three or more feet, with a gable raised at one end, the other being left open as a door, and the top closed by a roof and tiles. This method of covering such refoivors is far superior to those merely having flaps, or other similar contrivances.

Hog's Fennel, in Botany. See Peucedanum.

Hog, Hedge. See Echinodorus.

Hog, Sea Hedge. See Echinodorus, Centronia, and Sea Urchin.

Hog, Hairs of, in Agriculture, the stiff brifly fort of hair that is taken off from the body of hogs when they are killed, by means of leaking and fraping. This is a fubflance, where it can be collected in fufficient quantity, that may be made ufe of with advantage as a manure. It is capable of being occasionally purchased in the London markets at about nine or ten shillings the quarter, which is a ten bufeal fack fluffed quite full; and is applied to the land in such a way, as to be turned in jut before the crops are fown. In this method it is found to answer perfectly in foils of the more light defcription. Seal hair has likewise been found capable of being employed in the fame mode with equal ufefulness.

Hog Manure, the name of that fort which is produced by hogs in the ftries, yards, and other places where they are kept and confined. This is found, by experience, to be a very powerful and efficacious fort of material, being confidered by some as nearly equal to that of the horf. It has, however, been interferted as an objection to it by fome, that weeds are more liable to rife after the application of it, than that of fome other kinds of manure.

The farmers who ufe the dung of hogs for their lands, generally take care to fave it by well paving the fies, and increase the quantity by throwing in bean-talks, dibble, and many other things of a like kind; and, by good management of this kind, many farmers have procured fifty or fixty load of excellent manure a-year out of a small fley. The very beft way of uing this dung is to mix it with horf-dung; and, for this reason, it is beft to have the fie near the flable, that the two clearings may be mixed in one heap, and used together.

They have, in many parts of Staffordshire, a poor, light, shallow land, on which they fow a kind of white pea. The land is neither able to bear this, nor any thing else, to their advantage, for reaping. But when the peas are ripe, they turn in as many hogs as the quantity of peas will fatten, fuffering them to live at large, and remain there day and night; and, in conquence of this, the land will produce good crops of hay for feveral years afterwards, or, if too poor for that, it will, at the world, raise grafs enough to make it a good paifure-ground. See Dung and Manure.

Hog-plum, in Botany. See Spominas.

Hog-tree, a term often applied to the male or weder of one year old, as from the time of weaning to that of its being firft horned.

Hog-fler, among Hunters, a wild boar of three years old. See Boar.

Hog-fly, the name of a house or building contrived for the purpose of confining and keeping different kinds of hogs and swine. Much, especially in the faving of labour, and the making of manure, as well as in the food and keeping of the animals, depend upon the flies being formed in a convenient manner. They are ufually built in a very plain and simple method, the chief objects being confidered tho' of warm dry situations for the animals to lie in, with small areas or yards before them, and proper troughs fitted up for holding their food. They are most commonly contrived with lean-to or shed-roofs, and have but fides, more than fix or seven feet width, with height in the fame proportion. In order to have them as convenient as possible, they should be at no very great
HOG-STY.

Around these there should be a path, and beyond it the fence, which may be a wall or paling; in which the troughs with hanging lidos should be fixed, for supplying the food directly from the cullens on one side, and for the hogs feeding at on the other: next to this there should be a range of yards, and another of low sheds beyond it, and, lastly, the receptacle for the dung. The pig or potato fences should at one end point nearly to the entremme, and there it should be raised to the cullens and cullens at once by means of a proper pump; there being a trough or some other conveyance from the dairy to the cullens for the milk, whey, and other liquid matters. This sort of arrangement, it is supposed, will be extremely convenient and beneficial, while, at the same time, the expense need not be heavy. The attaching of a certain extent of grass land, or that of sown grasses, in proper divisions, into which the hogs may be capable of being turned as it may be found necessary, is, in fact, hinted, a matter of vast utility, where the nature of the situation will admit of it's being done. Where there is not a proper and conveniently formed pig apparatus, little idea can be had of its advantage in the making of manure. Yet this alone, it is conceived, is an object that would justify any good farmer in going to a certain expense in attaining to profitable a portion of what should constitute his farm-yard fylates as lamentable to be in nine-tenths of the farmleries of the kingdom, so many parts of the proper piggery scattered and unconnected in such a way as to prevent convenience, multiply labour, and retard the forming of plentiful supplies of valuable manure. The building of a hogbery, somewhat though not exactly upon this principle, was found to coot, including the boiling house, copper, pond, cullens, shed, paling, paving, and troughs, about 76l., independent of the timber. By means of a yard of this description, one man will be capable of managing three times as many hogs as would otherwise be the case. And where they are properly and completely littered, the quantity of excellent manure that is formed is very astonishing. The extent of 56 loads of very rich, dung compost, valued on the spot at five shillings the load, has been found to be made by the number of about 80 or 90 fattening hogs, or a clear profit of 15 or 16l. derived feely from this article; and it would be double that, if the littering was performed in a complete manner. These statements fully prove the prodigious importance of possessing such conveniences in the fattening of great numbers of hogs, in the view of raising manure.

Supporting the whole of the expense, including every thing, in one of these fylates, to rise to 100l. and the interest to be five pounds per annum; it is asked, what comparison there can be between the annual expense of five pounds, and the prodigious utility of having the power of constantly fattening with scarcely any expense of labour, any number of hogs that may be required? By means of such conveniences the whole of the peas, beans, barley, buck-wheat, potatoes, parsnips, carrots, and other similar sorts of food that are capable, or can be produced on a farm, may be converted to the purpose of rearing, feeding, or fattening of hogs; by which the farmer has the means of improving his ground in the cheapest manner, and to the fullest extent.

At present, the expense of such fylates and yards would be nearly double the above sum; and, where erected upon the most correct plan, still considerably more. The general principle should, however, be followed in fylates of much smaller dimensions. In many cases and circumstances, other plans and forms may, however, he followed with great propriety and advantage, being contrived so as to suit the local nature of the different situations.
HOG-AROUGH, a kind of box or other contrivance constructed for the purpose of containing the food of hogs until it be consumed. There are various kinds of troughs of this nature, which are formed of different sorts of materials under different circumstances; but those of wood and stone are by much the most usual. From the circumstance of hogs being liable to spill and waste a considerable portion of their food by getting their feet into it, Mr. Batefon has been induced to attempt the prevention of it, by having a rail or covering made to slope from the back to the front part of the trough, which may be formed of any sort of thin deal, just sufficient room being left to admit the heads of the animals. Divisions are likewise made crossways of the troughs, in proportion to the number of the hogs, in order to prevent the strongest from driving away such as are weak. But these divisions are not necessary to extend to the bottom of the troughs; they should, however, rise a little higher than the top, and are capable of being formed of portions of boards, which are about eight, or ten inches in breadth. But another way of preventing them from wasting their food, it is conceived, would be to have shallow wooden troughs placed about a foot from the ground, having large deep troughs above them with open bottoms. The food is deposited in the large-upper troughs, but at the same time no more is capable of passing down, than what rests in the bottoms of the shallow troughs; consequently, when that is consumed, a fresh supply will continually take place from the large upper troughs.

However, for food of the more liquid kind, such as milk, whey, and others of a similar kind, there may, it is supposed, be a stone trough below, and spurts or holes in the bottom of the shallow trough, to let the fluid matters pass through. These troughs of troughs are capable of being made to serve two divisions of the sty at the same time, by having them fixed up between them. Where water can be conducted through the sty in a small stream, by means of an open port of spout, so that it may conveniently supply the animals, it will be found of very great advantage.

HOG-THREE, in Botany. See Boerhavia.

HOG-THREE, a name frequently applied provincially to knot-grafs.

Hog, on board of a Ship, is a sort of flat scrubbing broom, formed by inclining a number of short twigs of birch or such wood, between two pieces of plank fastened together, and cutting off the ends of the twigs, and forging to its fiber from a ship's bottom, under water, particularly in the act of boot-topping. For this purpose they fit to this broom a long staff with two ropes; one of which is used to thrust the hog under the ship's bottom, and the other to guide and pull it up again, close to the planks. This business is commonly performed in the ship's boat, which is confined as close as possible to the vessel's side during the operation, and shifted from one part of the side to another, till the whole is completed. Marine Diät.

Hogs' Bones, Petrifex, in Natural History. Writers on extraordinary fossils have mentioned but very few bones or teeth which they refer to the genus Sus or hog, and have preferred little which is precise enough to entitle them to this classification. M. G. A. Cuvier, who gives a memoir on this subject, in the 14th vol. of the "Annales du Muséum," of which a translation may be seen in the Phil. Mag. vol. 35, p. 219, considers all the fossil remains which can safely be referred to the genus Sus (whole characters, applicable to this enquiry, he gives) to belong to the peats and most modern of the alluvia of low grounds, or to be peat or recent fossils.

HOGARTH, WILLIAM, in Biography, one of those few original and extraordinary characters whom it has pleased Providence occasionally to blest the world with; to enlighten mankind, and to carry the arts and sciences necessary for their comfort, pleasure, and improvement, nearer to perfection. It cannot, however, be thoroughly said of Hogarth, that he improved the practice of the arts of painting and engraving which he professed; but he merited the praise of having more powerfully exhibited their moral utility than any of his predecessors; and that in a new and till then unthought of mode, more generally felt and understood, being adapted to the feelings of all orders of men, as it arose from a closer observance of the actions and expressions common to all under the influence of the passions. Moved by the impulse of genius rather than the tuition of man, he travelled in a path unexplored by any before him, and which yet remains closed to succeeding artists. Poisingly, by early practice, the knowledge of the art of engraving, he was happily enabled to disseminate, by its means, the ingenious inventions and labours of his mind, in a manner more perfect than that of other painters have been presented to the world, or than probably ever again will be done, till another painter shall be his own engraver. Stimulated by the love of fame, and the desire of many of his friends, Hogarth, towards the close of his life, composed a short history of himself, from whence we shall extract the most essential parts; and present our readers with some illustration of his works, his character, his pretensions to public favour, and the reception he experienced.

His father's name was Richard, he was a man devoted to literature; but his pen, like that of many other authors, did not enable him to do more for his children than to give them education; and merely, as his son observed, put them in a way of shifting for themselves. William, of whom we now treat, was born in London, in the parish of St. Bartholomew the Great, on the 10th of November, 1697. What will those who hold the non-existence of innate genius for peculiar arts, & c. reply to Hogarth's account of the sensations he experienced in his infancy? viz. "Having naturally a good eye and fondness for drawing; flows of all sorts gave me uncommon pleasure when a child, and energy was remarkable in me."—"An early access to a neighbouring painter drew my attention from play, and I was at every possible opportunity employed in making drawings."—"My exercises, when at school, were more remarkable for the ornaments which adorned them, than for the exercise itself; in the former, I soon found that blockheads with better memories could much surpass me, but for the latter I was particularly distinguished."—"It was therefore very conformable to my own wishes that I was taken from school and served a long apprenticeship to a silver-plate engraver." This engraver was Mr. Ellis Gamble, of Cranbourn-alley.

I soon found this business in every respect too limited. The paintings of St. Paul's cathedral and Greenwich hospital, then going on by Sir James Thornhill, ran in my head; and I determined that silver-plate engraving should be followed no longer than necessity obliged me to it. Engraving on copper was, at twenty years of age, my most ambition. To attain this, it was necessary that I should learn to draw objects something like nature, instead of the monstrosities of heraldry. Animated by this desire, he considered how he could, by the shortest way, obtain possession of the knowledge he required; and spurning the regular mode of academical study, adopted a plan of his own. "Many reasons," he says, "led me to wish that I could find the shorter path; fix forms and characters in my mind; and instead of copying lines, try and read the language of the art;
HOGARTH.

art; and, if possible, find its grammar, by bringing into one form the various observations I had made, and then try how far I could combine them, and apply them to practice.

"Laying it down first, as an axiom, that he who could by any means acquire and retain in his memory perfect ideas of the subjects he meant to draw, would have as clear a knowledge of the figure as a man, who can write freely, both of the twenty-four letters of the alphabet, and their infinite combinations (each of these being composed of lines); and would consequently be an accurate designer:—" Then, in order to habituate myself to the exercise of a sort of technical memory, and by repeating in my own mind the parts of which objects were composed, I would by degrees combine and put them down in pencil. Thus, with all the drawbacks which resulted from the circumstances in which I was placed, I had one material advantage over my competitors, viz., the early habit I thus acquired of retaining in my mind's eye, without coldly copying it on the spot, whatever I intended to imitate.

"My pleasures and my studies thus going on hand in hand, the most striking objects that presented themselves, either comic or tragic, made the strongest impressions on my mind; but had I not lucidly practiced what I had thus acquired, I should very soon have lost the power of performing it."— Instead of barrenness of the memory with many rules, or tiring the eyes with copying dry and damaged pictures, I have ever found studying from nature the shortest and safest way of attaining knowledge in my art. By adopting this method, I found a redundancy of matter continually occurring. A choice of composition was the next thing to be considered, and my constitutional idleness naturally led me to the use of such materials as I had previously collected; and to this I was further induced by thinking, that if properly combined, they might be made the most useful to society in painting, although similar subjects had often failed in writing and preaching.

In concurrence, therefore, with this reasoning, Hogarth set about qualifying himself for the pursuit of his object immediately upon the expiration of his apprenticeship, which was about the year 1718; and began to engrave on copper for the booksellers. This prize-worthy emulation brought with him as it generally does with those who dare to enter into self-denying a course of excellence. He continued to live in industrious diligence for some time, whilst those who had the means of viewing his early productions were growing rich by his labours.

It is said of one of those patrons of the youthful artist, that he very generously offered him half-a-crown a pound for a finished plate; and at another time the same person offered to Mr. Major two plain pieces of copper for two engraved ones; with the generous view that the youth might not lack the means of exerting his ingenuity!!

Feeling the full weight of this kind of treatment, Hogarth resolved upon publishing on his own account. But in this he had to encounter another enemy in the body of print-sellers, who, upon his publishing his first plate of "The Taste of the Town, or Burlington Gate," (in 1724,) soon procured copies of it, and sold them at half the price; so that he was obliged to sell the plate as their shops were the only places of sale.

"Owing to these kinds of circumstances, till I was near thirty years of age," he says, "I could do little more than barely maintain myself by engraving." It is probable, that about the time of publishing the above-mentioned print he commenced painter; as Mr. John Ireland, in his account of Hogarth, that he was in poffession of a set of pictures designed for the large plates he published from Butler's Hudibras in 1726. They are but indifferent in the promise they hold forth of their author, and are executed in somewhat of the style of Henschell. From this time he was known as a painter, and employed in painting portraits, and small pictures of family conversations, as they are called, or groups of family portraits.

In 1729, he married the only daughter of Sir James Thornhill, without the consent of the knight her father, who probably regarded him as an inferior artist, and felt degraded by the union; till the designs for the Harlot's Proofs were laid before him; satisfied then that his daughter had chosen a man of extraordinary merit, though poor in purse, he became reconciled to the match, and lived till his death in terms of intimacy with his son-in-law, and was a constant and generous friend to him.

Hogarth proceeded with success for some time in painting his portraits, "but feeling it a kind of drudgery; and as I could not act like some of my brethren, and make it a sort of manufacture to be carried on by the help of back-ground and drapery painting, it was not sufficiently profitable to pay the expenses of my family. Therefore turned my thoughts to a still more novel mode in painting and engraving modern moral subjects, a field not broken up in any country or any age."

The reasons which induced me to adopt this mode of designing were, that I thought both writers and painters had, in the historical style, totally overlooked that intermediate species of subjects which may be placed between the sublime and grotesque. I therefore chose to compose pictures on canvas, similar to representations on the stage; and farther hope that they will be tried by the same test and criticized by the same criterion.

"In these compositions, those subjects that will both entertain and improve the mind bid fair to be of the greatest public utility, and must, therefore, be entitled to rank in the highest class."— "I have endeavoured to treat my subject as a dramatic writer; my picture as my stage, and men and women my players; who, by means of certain actions and gestures, are to exhibit a dunce from.

In pursuing my studies, I made all possible use of the technical memory, which I have before described, by observing, and endeavouring to retain in my mind linearly, such objects as heft suited my purpose. So that, whilst I could, while my eyes were open, I was continually at my studies; and acquiring something useful to my profession. A redundancy of matter being by this means acquired, it is natural to suppose, that I introduced it into my works on every occasion that I could.

"By this idle way of proceeding, I grew so profane as to admire nature beyond the first productions of art; and acknowledged I saw, or fancied, delusions in the life so far surpassing the utmost efforts of imitation, that when I drew the comparison in my mind, I could not help uttering blamable expressions against the divinity of Raphael, Correggio, and Michael-Angelo. For this, though my brethren have most unmercifully abused me, I hope to be forgiven. I confess to have frequently said, that I thought the style of painting which I had adopted, admitting that my powers were not equal to doing it, might, one time or other, come into better hands, and be made more entertaining, and more useful, than the eternal blazing, and tedious repetition, of hackneyed beaten subjects, either from the fcriptures, or the old ridiculous stories of heathen gods: as neither the religion of the one or the other requires promoting among Protestants, as it formerly did in Greece; and at a later period in Rome."
In language of this nature Hogarth was accused of vanity, and of ensively endeavouring to under-rate what he was unable to execute. And certainly with much justice the remarks appear to have been made; for, previously to his adopting the line of conduct in painting, which was so suitable to his peculiar genius, he attempted several pictures in the grand historical style, and in all failed most woefully. It is apparent that he at no time of his life understood the object or character of that species of art, and was, therefore, ill qualified to judge of its value. But probably he was urged to the strong declarations which he indulged in, by seeing the success of infamous dealers in bad copies, and continually bearing, as all painters are obliged to do, bad originals exhibited beyond all bounds, because they are supposed to be the productions of this or that man of genius; while, in fact, they may be the inferior labours of some mongrel imitator. What, however, but the extreme of vanity, could induce a man, if ill trained in art, to think of contending with Pouflin and Correggio in history, and with Vandyke in portrait. He affected himself equal to either in their way, and in both proved himself grossly defective. In his oil line and manner relied on that alone, distinct from any one, he was far superior; conceiving his subjects with most confinmate intelligence, and executing them with appropriate character and style.

After some time he felt the effect of the remarks of his adversaries (though he never acknowledged his incapacity), and almost entirely abandoned portraiture and serious history; and wisely adhered to his judicious choice of subject and manner; for the adoption of which he felt such powerful reasons as are mentioned above.

He had, however, in the interim, favoured the world with various productions of that kind, which were then, and still are, and probably for ever will be, highly esteemed. In 1733 he published his first great work, "The Harlot's Progress," and in 1735, it was followed by its counterpart, "The Rake's Progress." The very extraordinary merit of these productions, and the favourable reception they met with, soon induced the print-makers to be guilty of the base and mean conduct of having copies made of them, and thus rob the ingenious author of his well-earned reward.

To prevent this nefarious practice from continuing, Hogarth, in conjunction with Vertue and five other artists, in the year 1735, applied, by petition to the legislature, for a bill to protect their property, similar to that for the security of copy-right in literary productions. A bill was consequently passed to secure the property of an engraved plate to the original possessor of it for fourteen years from the first day of publication; which was to be specified on the print. From this time, and owing more to this circumstance than any other, prints have become a very considerable article of commerce in this country. Our artists commemorated the circumstance, by an emblematical engraving, with an inscription expressive of the subject; impressions from which he filled at that time, distinct from every one, he made it the subscription ticket.

Upon the security of this act, Hogarth employed himself with alacrity, and produced other works, which, while tute and good sense prevail in the world, will ensure the admiration of all who poise these useful qualities, by their ingenuity, and the force of their satire. In 1736 he published "The Sleeping Congregation," "The Distreßed Poet," and some others of less note. In 1738 "The Four Parts of the Day; Morning, Noon, Evening, and Night;" "Strolling Actors dressing in a Barn;" and in this and three following years, Vol. XVIII.

He appears to have laboured hard at a number of minor productions, and in preparing the plate of his most celebrated work, "The Marriage-a-la-mode," of which he had given notice in 1743. He had projected a counter-part to this effect of "A Happy Marriage," to be treated likewise in five plates; but one only of the designs for it was completed, and that was never engraved.

The very excellent and admired series of prints just alluded to, were followed, in 1747, by those of the "Indolent and Idle Apprentices," and of "Goggs' Opera," whose moral utility is felt and acknowledged by all. Gay's "Macheath in the Beggar's Opera," by his spirited gallantry, is said to have been the cause of many a youth falling into bad courses: it is hardly possible to calculate the efficacy of these prints in a contrary direction; probably much more than lectures or sermons of the utmost eloquence could produce. The impression they made at the time was almost incredible.

Hogarth's own account of the motives which induced him to publish these two series do him infinite honour, and shew the nobleness of his views. "These twelve prints were calculated for the instruction of young people, and every thing addressed to them is fully described in words as well as figures," &c. — "Considering the persons they were intended to serve, I have endeavoured to render them intelligible, and as cheap as possible. Fine engraving is not necessary for such subjects; if, what is infinitely more material, character and expression is properly preserved." — "These prints I have always found fell much more rapidly at Christmass than at any other time."

Soon after the treaty of Aix la Chapelle, Hogarth, in search of character and matter for the employment of his pencil, went over to France; but allowing his natural inclination to get the better of his judgment, and fudging him to draw "The Gate of Celais," of which he, after his return, published the humorous print under that title; he was prevented, by imprisonment in his lodgings, from proceeding beyond that town; and soon after compelled to go on board a ship and return to England.

In 1745, finding that, however great the success of his prints might be, the public were not inclined to take his pictures off his hands, he was induced to offer some of them, and these of the best he had then produced, for disposal by way of auction; but after a plan of his own, viz. by keeping open a book to receive biddings from the first day of February to the last day of the same month, at 12 o'clock. The ticket of admission to the sale was his print of "The Battle of the Pictures," a humorous production, in which he ingeniously upheld his affections concerning the preference so unfairly given to old pictures, and the tricks of the dealers in them. See Nichol's and Ireland's Account of Hogarth.

The pictures thus disposed of were:

- The six of the Harlot's Progress, for £88.0.0
- Eight of the Rake's Progress, 134.16.0
- Morning, Noon, Evening, Night, 21.0.0
- Strolling Actors dressing in a Barn, 39.17.0
- Night, 29.18.0
- Strolling Players dressing in a Barn, 27.6.0
- The March of the Guards towards Finchley, 76.6.0
- The Strolling Actors dressing in a Barn, 76.6.0

In 1746, having finished his picture of "The March of the Guards towards Finchley," he offered proposal for a print from it, and a scheme to dispose of the picture itself, by a lottery of chances, at so low a price as three filings, in addition to 7s. 6d. subscribed for a print. Having disposed of 1483 chances, he gave his remaining numbers, amounting to 167, to the Foundling hospital, one of which, when the plate was finished, and the lottery drawn, in the year 1750, was fortunate, and that very extraordinary and ingenious
ingenious production thus became the property of that Institution; within whose walls it yet remains, with several other of his productions; particularly an excellent portrait of captain Thomas Coram, founder of the hospital, and an historical picture of "Moles brought before Pharaoh's Daughter."—By this scheme, Hogarth obtained 200l. for the picture, observing, "that it was only chance of being paid for his time: such was the patronage of the arts at that period in England; now happily very highly increased, to the credit of the public, and the advancement of the practical part of the art at least.

In the year in which the above-mentioned print was published, Hogarth was employed by the benchers of Lincoln's Inn to paint a picture for their hall, in consequence of their having been bequeathed 200l. by lord Wyndham, chancellor of Ireland, for the purpose of ornamenting that room as they thought proper. On the proposal of lord Mansfield, the voice of the members was given for a picture by our artist, and, unhappily for his reputation, he chose a subject of an elevated and serious nature, "St. Paul before Felix." From one who preformed to smile at the high estimation in which the real works of the renowned artists of Italy were held, and boasted of his power to rival them, the world had a right to expect much.

Instead of answering such expectation, he totally failed. In every requisite for such a work, it must be owned, by his best friends, this picture is wretchedly defective. It still occupies its original situation, and exhibits a useful lesson to those who place too high a value on their natural talents; and teaches them not to waste their powers on matters for which previous education has not prepared them; nor too readily to under-rate those of others, exerted in a different manner. Every branch of the art of painting requires its appropriate studies, and no man can combine materials with which he is unacquainted. Hogarth, employed to earn his bread from the first, had not the time or the means, in this country, to inform himself properly of what was grand and impressive in the art. That which was expressive in common life he felt, and delineated with great force, but with common-place effect. Selection of beauty, of dignity and grandeur, which this subject required, he evidently knew nothing of; and consequently failed in his attempt to inspire his figures with such qualities.

Whether he felt this himself when the picture was completed may be doubted; but he certainly attempted to parry criticism, by satirizing his own work, and published a ludicrous print of the subject, nearly of the same composition, but attempted to throw the effect upon Rembrandt's manner of etching. Upon advertising a print of the real picture, he adds, "On the first payment a receipt will be given, which receipt will contain a new print (in the true Dutch Taste) of "Paul before Felix"; which, after the subscription is over, will not be sold at a less price than one guinea each."

At the same time he advertised for sale his most beautiful series of pictures before mentioned, "The Marriage-a-la-mode," by a manner of bidding peculiar to himself; from which he excluded all dealers in pictures. The mode he adopted was by written tickets, on which subscribers wrote their names and the price they would give. This was kept open for the space of one month. But either the public were not alive to the beauties and excellencies of these incomparable works, or his manner of proceeding displeased them: for the fact is, there were few competitors, and they were sold at the low price of 120 guineas, with their frames, to Mr. John Lane, of Hillingdon; on whose death they became the property of his nephew, colonel Cawthorne.

Being offered at auction by Mr. Chrifles, in 1792, the proprietor bought them in at 500 guineas. A short time afterwards they were bought by Mr. Angerlein, at the price of 1000 guineas, and with him they still remain, justly and deservedly admired for their fulness of character and expression, and their beauty of composition, colouring, and execution, and are a complete falsification of Mr. Walpole's assertion, "that Hogarth was no painter."

In the following year, 1751, he published his moral and instructive prints of "Beer-street," "Gin-lane," and "The Four Stages of Cruelty." The generous and truly humane motives which induced him to make the four last designs he himself has thus described: "These prints were engraved with the hope of, in some measure, correcting that barbarous treatment of animals, the very light of which renders the streets of our metropolis so detestable to every feeling mind. If they have had this effect, I am more proud of having been the author, than I should be of having painted Raphael's cartoons."

During the time of which we have been treating concerning Hogarth's practice and studies, he continued occasionally to paint portraits; but it was not his forte. He produced, indeed, several acknowledged strong likenesses, but without any elevation of sentiment or character.

He now thought it proper, in order to justify and enforce more points upon which he had difagreed and contended with other artists, to turn author. He had, in the year 1745, painted his own portrait with his dog; before him lay a palette spread with colours, and on it was drawn a waving line, which he entitled "The Line of Beauty." In this, Hogarth had a design. It appeared an enigma, and he himself relates, that "no Egyptian hieroglyphic ever amused for a time more than it did. Painters and sculptors came to me to know the meaning of it, being as much puzzled with it as other people, till it came to have some explanation; then, and not till then, some found it out to be an old acquaintance of theirs."—"Others denied that there could be such a rule either in art or nature, &c." See preface to the work, which, in 1753, he thought fit to publish under the title of "The Analyst of Beauty", written with a view of fixing the fluctuating ideas of Taste." Its object is to shew that waving lines are the source of beauty; and that grace is supressed, when that line is twilled to a certain degree, and becomes serpentine. In it are numerous references to various objects represented in two prints, which he etched and published with the book, and in which, if he has not satisfactorily illustrated the whole of his intention, he has done enough to prove the truth of his main position. Every artist may obtain benefit by the perusal of the work. It is divided into chapters, treating of those points, which, in his mind, formed the basis of beauty: viz. fitness, variety, symmetry, simplicity, intricacy, quantity; and he adds to these, others on lines, compositions with the waving line, compositions with the serpentine line, proportion, light and shade, colouring, the face, attitude, and action.

Hogarth, in the conscientiousness of the pencil, not the pen, being the instrument by which he could best illustrate his ingenious and original thoughts; at first intended to engage some literary person to write what he should dictate, but soon discarded that idea: and having written his work, subjected it by parts to the correction of Dr. Morrell, after whose death, the Rev. Mr. Townley kindly undertook the unthankful task of caitigation on a young author; who, nevertheless, profited so much by the remarks on the first pages, that he greatly advanced in facility of expression as he proceeded with it. The style is plain and unadorned, but clear and intelligible.
His mode of illustration is original and ingenious. We are satisfied there is great truth in his principles and observations; and that the world of art is greatly indebted to him for the work, though there are many opinions in which we cannot coincide; and with he had not indulged so freely in ill-natured and sullen allusions to persons and things not connected with his subject. These latter drew upon him, in consequence, much invective and satire; and by his own account, the unkindness it occasioned him, more than counter-balanced the pleasure afforded by its general success. See his own history, written by himself, in John Ireland's Illustrations, vol. iii. p. 105, where he has given much additional and ingenious reasoning on the subject of his book, but speaks freely of the unfairness of the attacks made upon him; which were many, and of no very delicate nature. In opposition to this, he had the favourable testimony of many learned men, (Warburton among them,) in its favour. It was translated into German by Mylius, under the author's inspection; and an Italian translation was soon afterwards published at Leghorn.

In 1754, the members of the Imperial Academy at Augsburg, erected for the study and improvement of arts and letters, were induced, on the appearance of this work among them, to elect Hogarth a counsellor and honorary member. In addition to this high founding title, he had a more substantial benefit conferred upon him this year, by the appointment of the painter to the king, which produced him 200l. per annum.

In 1755 he published the plates of the election, which was the last series of prints he favoured the world with; but he afterwards sent forth several single prints, fraught with useful moral instruction, conveyed by ingenious satire on the public follies of the day. The most striking of them, were, "The Cockpit," "Enthusiasm delineated," and "The Medley, or a satire on Credulity, Superstition, and Fanaticism," which last appeared in 1762.

In the interim he made another unsuccessful attempt at serious historical painting; and that under circumstances particularly unfavourable to him; the failure in which, or rather the public circumstances connected with it, was thought by many to have hastened his end. He was induced by vanity to endeavour at rivalry with a picture, said to be by Correggio, of "Sigismunda weeping over the Heart of her Lover." The consequence was, what might justly have been expected, disappointment, with the world at large, however he might himself appreciate it. He set the same value upon it as its prototype had been brought at sale by public auction, viz. 400/. The nobleman for whom it was painted execrated himself from taking it, and it remained with Hogarth to his death. It is at present in the possession of Mr. Alderman Boydell. See an account of it in Ireland's and Nichol's Anecdotes, &c. of Hogarth.

It is lamentable, that a man so highly useful and honourable to his country and the arts he professed, should, by singularity, and by an impolitic, although upright mode of conduct, bring enemies upon himself as he advanced in years; who, unequal to cope with him for the bright rewards of genius, yet had influence enough in the world to fling him, and that remorselessly, by petty, paltry efforts. These, though they could never seriously wound his fame, yet disturbed his repose, and prevented the enjoyment of those well earned encomiums the wise and virtuous were inclined to bestow upon his meritorious efforts. Such, unhappily, was the fate of Hogarth. Strong in mind, original in reflection, and deeply reflective, but narrowed by want of education; he lavished abroad opinions peculiar to himself; opposing old and well-founded reasonings, because he saw more of their abuse than of their utility. He appears to have been a humourist, but of the best class. He spoke his mind freely, heedless of the result. Its effect upon him proved to others who may be inclined to follow the same course, that it is not always to be pursued with impunity.

To shew that these remarks are well founded, we shall infert his own account of his feelings on the observations made upon his Sigismunda: "the most violent and virulent abuse thrown on Sigismunda was from a set of miscreants, with whom I am proud of being ever at war. I mean the expounders of the mysteries of old pictures. I have been sometimes told they were beneath my notice. This is true of them individually, but as they have access to people of rank, who seem as happy in being cheated as these merchants are in cheating them, they have a power of doing much mischief to modern artists. However mean the vendor of potions, the mineral is destructive; to me its operation was troublesome enough. Ill-nature spread so fast, that now was the time for every little dog in the profession to bark, and revive the old spleen which appeared at the time of the Analytis. The anxiety that attends endeavouring to recollect ideas long dormant, and the misfortunes which clung to this transaction, coming at a time when nature demands quiet, and something besides exercise to cheer it, added to my long fedentary life, brought on an illness which continued twelve months. But when I got well enough to ride on horseback, I soon recovered."

In a state thus irritable, goaded by malignity and envy, and reftless entirely upon his own conscious rectitude, and the conflation of a few friends, who knew how to estimate his talents and his genuine worth, for support; he continued to employ himself on minor labours; till, in 1762, he unfortunately elicited a flame of enmity in the breasts of two powerful antagonists, under whose united efforts he sunk. These were Wilkes and Churchill, whose great ingenuity and keen satire he drew upon himself, by exhibiting them in his print of "The Times," as incendiaries; mourners of public disturbances. His own account of this circumstance we shall extract from J. Ireland's Illus. vol. iii. p. 212, et seq. "This being a period when war abroad, and content at home filled every body's mind, prints were thrown into the back-ground, and the clamour rendered it necessary that I should do some timed thing to recover my lost time, and flop a gap in my income. This drew forth my print of "The Times," a subject which tended to the restoration of peace and unanimity, and put the opposers of these humane objects in a light which gave great offence to those who were trying to foment disaffection in the minds of the populace. One of the most notorious among them, till now rather my friend and flatterer, attacked me in a North Briton, in so infamous and malign a styfe, that he himself, when pushed, even by his best friends, was driven to so poor an excuse, as to say, he was drunk when he wrote it. Being at that time very weak, and in a kind of low fever, it could not but seize on a feeling mind. My philosophical friends advise me to laugh at the nonse of party-writing—who would mind it? But I cannot rett myself." To revenge himself, he published a likeness of Wilkes, which doubtless he thought was the greatest satire upon his pretension to political honesty and heroic character that he could produce. This drew upon him Churchill the poet, who severely treated him in an epistle, fraught with the greatest abuse and the utmost malignity; and even falsehood, though in some parts justly complimentary. All that the bitternses of resentment could dictate, or the malevolence of the keenest satire inspire, is poured forth in it upon the devoted Hogarth, who could only retort by a print of a bear with a pot of porter and a
HOGARTH.

ragged staff, on the knots of which was written lies, lies, lies!

This unhappy event Hogarth did not long survive. It is said that he did not suffer in mind by the coarse attack of Churchill, so much as by the previous one by Wilkes; he says of it himself, that "it made no impression, but perhaps in some measure effaced or weakened the black strokes of the North Briton." And he concludes his own memoir by saying, "Thus have I gone through the principal circumstances of a life which, till lately, puffed pretty much to my own satisfaction, and I hope in no respect injurious to any other man. This I can safely assert, I have invariably endeavored to make those about me tolerably happy, and my greatest enemy cannot say I ever did an intentional injury; though, without offence, I could produce many instances of men that have been essentially benefited by me. What may follow God knows! Finis."

Such is the candid appeal, which, in consciousnes of found principle and rectitude of heart, this excellent artist and well intentioned man made to his contemporaries and to posterity. Let the human weaknesses he exhibited in common with his fellow men teach them, like his works, (which necessarily lead to moral reflection), that strict government of the heart and mind, and kind indulgence to the infirmities of others, are the surest guides to happiness; here, as well as hereafter.

His last original production he termed Finis, the Bathos, or the Art of sinking in Sublime Painting; which Mr. J. Ireland justly terms an enigmatical and punical print. The origin and production of which he thus describes.

After dinner, with a few social friends at his own table, he was asked what will be the subject of your next print? "The end of all things!" was his reply. If that should be the case, added one of his friends, your business will be finished, for there will be an end of the painter. With a look that conveyed a consciousness of approaching dissolution, and a deep sigh, he answered, "there will be so, and therefore, the sooner my work is done the better." With this impulse, he next day began the plate, and solemnly to consider it as a "terminus to his fame," never turned to the right or left until he arrived at the end of his journey.

The above print was published in March 1764, and in the October following, death put a "finis" to the labours of this extraordinary man, and deprived society of one of its most useful members; who contributed alike to its amusements and its improvement, and has left a perpetual fund of both for the benefit of future ages.

The following concise critical dissertation upon the character and works of Hogarth, from the elegant pen of the late Horace Walpole, earl of Orford, we conceive will be agreeable to our readers, and prove a valuable addition to the above account of his life.

"Having dispatched the herd of our painters in all, I referred to a clafs by himself that great and original genius, Hogarth; considering him rather as a writer of comedy with a pencil, than as a painter. If catching the manners and follies of an age living as they live, if general fatire on vices and ridicule, familiarized by strokes of nature, and heightened by wit, and the whole animated by proper and just expressions of the passions, be comedy, Hogarth composed comedies as much as Moliere; in his Marriage A-la-Mode there is even an intrigue carried on throughout the piece. He is more true to character than Congreve; each personage is distinct from the rest, acts in his sphere, and cannot be confounded with any other of the dramatic personage. The alderman's footboy, in the last print of the set I have mentioned, is an ignorant ruffian; and if wit is struck out from the characters in which it is not expected, it is from their acting conformably to their situation, and from the mode of their passions, not from their having the wit of fine gentlemen. Thus there is wit in the figure of the alderman, who, when his daughter is expiring in the agonies of poison, wears a face of solicitude, but it is to save her gold ring, which he is drawing gently from her finger. The thought is parallel to Moliere's, where the nifer puts out one of the candles as he is talking. Moliere, imitable as he has proved, brought a rude theatre to perfection. Hogarth had no model to follow and improve upon. He created his art; and used colours instead of language. His place is between the Italians, whom we may consider as epic poets and tragedians, and the Flemish, painters, who are as writers of farce and editors of burlesque nature. They are the Tom Browns of the mob. Hogarth resembles Butler, but his subjects are more univera!; and amidst all his pleasantery, he observes the true end of comedy, reformation; there is always a moral to his pictures. Sometimes he refe to tragedy, not in the catastrophe of kings and heroes, but in marking how vice conducts, inoffensively and incidentally, to misery and shame. He warns against encouraging cruelty and idlenes in young minds, and discerns how the different vices of the great and the vulgar lead by various paths to the same one end. The fine lady in Marriage A-la-Mode, and Tom Nero in the Four Stages of Cruelty, terminate their story in blood,—the occasions the murder of her husband; he affilates his miftruf. How delicate and superior too is his satire, when he intimates in the College of Physicians and Surgeons that prejudice at a defilement, how the legal habit of viewing shocking scenes hardens the human mind, and renders it unfeeling. The president maintains the dignity of infenfibility over an executed corpge, and considers it but as the object of a lecture. In the print of the Sleeping Judges, this habitual indifference only excites our laughter.

"It is to Hogarth's honour that, in so many scenes of fate or ridicule, it is obvious that ill-nature did not guide his pencil. His end is always reformation, and his reproofs general. Except in the print of the Times, and the two portraits of Mr. Wilkes and Mr. Churchill, that followed, no man, amidst such a profusion of characteristic faces, ever pretended to discover or charge him with the caricature of a real person; except of such notorious characters as Chartres and mother Needham, and a very few more, who are acting officially and suitably to their professions. As he must have observed fo carefully the operation of the passions on the countenance, it is even wonderful that he never, though without intention, delivered the very features of any identical person. It is at the same time a proof of his intimate intuition into nature; but had he been too severe, the humanity of endeavouring to root out cruelty to animals would have been too fatire. It is another proof that he drew all his ftes from nature and the force of his own genius, and was indebted neither to models nor books for his style, thoughts or hints, that he never succeeded when he designed for the works of other men. I do not speak of his early performances at the time that he was engaged by bookfellers, and role not above those they generally employ; but in his mature age, when he had invented his art, and gave a few designs for great authors, as Cervantes, Gulliver, and even Huibras, his compositions were tame, spiritless, void of humour, and never reach the merits of the books they were designed to illustrate. He could not bind his talents to think after any body else. He could think like a great genius rather than after one. I have a sketch in oil that he gave me, which he intended to engrave; it was done at the
time that the house of commons appointed a committee to inquire into the cruelties exercised on prisoners in the Fleet to extort money from them. The scene is the committee; on the table are the instruments of torture. A prisoner in rags, half starved, appears before them; the poor man has a good countenance, that adds to the interest. On the other hand is the inhuman gaoler. It is the very figure that Salvator Rosa would have drawn for Iago in the moment of detection. Villain, fear, and confidence, are mixed in yellow and livid on his countenance; his lips are contracted by terror, his face advances as eager to be his legs flung back as thinking to make his escape; one hand is thrust precipitously into his bosom, the fingers of the other are catching uncertainly at his button-holes. If this was a portrait, it is the most speaking that ever was drawn; if it was not, it is still finer.

"It is seldom that his figures do not express the character he intended to give them. When they wanted an illustration that colours could not bellow, collateral circumstances, full of wit, supply the notes. The nobleman in Marriage A-la-mode has a great air—the coronet on his crutches, and his pedigree issuing out of the bowels of William the Conqueror, adds to his character. In the Breakfast the old steward reflects for the spectator. Sometimes a short label is an epigram, and is never introduced without improving the subject. Unfortunately some circumstances, that were temporary, will be lost to posterity, the fate of all comic authors; and if ever an author wanted a comment, that none of his beauties might be lost, it is Hogarth—not from being obscure (for he never was that but in two or three of his first prints, where transient national follies, as lotteries, free-masonry, and the South-sea, were his topics), but for the use of foreigners, and from a multiplicity of little incidents, not essential to, but always heightening, the principal action. Such is the spider's web extended over the poor's box in a parish-church; the blunderers in architecture in the nobleman's flat seen through the window, in the first print of Marriage A-la-mode; and a thousand in the Strollers dashing in a Barn, which for wit and imagination, without any other end, I think the bell of all his works; as for useful and deep satire, that on the Methodists is the most sublime. The scenes of Bellam and the Gaming-house are inimitable representations of our froward follies or unavoidable woes; and the concern flung out by the lord-mayor, when the coming on of his childhood is brought before him as a crime, is a touching picture, and big with humane admiration and reflection."

"Another instance of this author's genius, is his not contending to explain his moral lessons by the trite poverty of allegory. If he had an emblematic thought, he expressed it with wit, rather than by a symbol. Such is that of the whore setting fire to the world in the Rake's Progress. Once indeed he defended to use an allegoric personage, and was not happy in it; in one of his election prints Britannia's chariot breaks down while the coachman and footman are playing at cards on the box. Sometimes too, to Please his vulgar customers, he lowered to low images and national satire, as in the two prints of France and England, and that of the Gates of Calais. The latter indeed has great merit, though the caricature is carried to excess. In all these the painter's purpose was to make his countrymen observe the evils and misfortunes of a free government, opposed to the wants and woes of flaves. In Beer-drest the English butcher toffing a Frenchman in the air with one hand is absolute hyperbole; and what is worse, was an afterthought, not being in the first edition. The Gin-alley is much inferior, horribly fine, but disgusting.

"His Bartholomew-fair is full of humour; the March to Finchley, of nature; the Enlarged Musickian tending to farce. The Four Parts of the Day, except the last, are inferior to few of his works. The Sleeping Congregation, the Lecture on the Vacuum, the Laughing Audience, the Consultation of Physicians as a coat of arms, and the Cockpit, are perfect in their several kinds. The prints of Industry and Idleneses have more merit in the intention than execution.

"Towards his latter end he now and then repeated himself, but seldom than most great authors who executed so many."

"It may appear singular, that of an author whom I call comic, and who is so celebrated for his humors I should speak in general in so serious a style; but it would be preposterous to consider the merits of his heart to confine him only as a perpetrator of laughter. I think I have shown that his works were more generous and extensive. Mirth coloured his pictures, but benevolence designed them. He liked as Socrates, that men might not be offended at his lectures, and might learn to laugh at their own follies. When his topics were harmless, all his touches were marked with pleanfancy and fun. He never laughed, like Rabelais, at nonsense that he imposed for wit: but, like Swift, combined incidents that divert one from their unexpected encounter, and illus- trate the tale he means to tell. Such are the hens roosting on the upright waves in the scene of the Strollers, and the devil drinking porter on the altar. The manners or costume are more than observed in every one of his works. The very furniture of his rooms describe the characters of the persons to whom they belong; a lesson that might be of use to comic authors. It was referred to Hogarth to write a scene of furniture. The rakes's leave-room, the nobleman's dining-room, the apartments of the husband and wife in Marriage A-la-mode, the alderman's parlour, the poet's bed-chamber, and many others, are the history of the manners of the age."

"But perhaps too much has been said of this great genius as an author; it is time to speak of him as a painter, and to mention the circumstances of his life, in both which I shall be more brief. His works are his history."

"His apprenticeship was no sooner expired, than he studied drawing from the life, in which he never attained to great excellence. It was character, the passions, the soul, that his genius was given him to copy: his force lay in expref- sion, not in tints and chiaro-focto. At first he worked for book-fockers, and designed and engraved 'plates for several books; and, which is extraordinary, no symptom of genius dawned in those plates. His Hubbard was the first of his works that marked him as a man above the common, yet what made him then noticed, now surpriues us to find so little humour in an undertaking so congenial to his talents. On the success however of these plates he commenced painter, a painter of portraits; the most ill-fitted employment imaginable to a man whose turn certainly was not flattery, nor his talent adapted to look on vanity without a sneer. Yet his facility in catching a likeness, and the method he chose of painting families and conversations in small, then a novelty, drew him prodigious busines for some time. It did not last, either from his applying to the real bent of his disposition, or from his customers apprehending that a satirist was too formidable a confeder at for the devotees of self-love."

"His Midnight Modern Conversation was the first work that showed his command of character; but it was the Har- lot's Progres, published in 1739 or 1740, that established his fame. The pictures were scarce finished and no sooner exhibited to the public, and the subscription opened, than above twelve hundred names were entered on his book."
book. The familiarity of the subject, and the propriety of the execution, made it taunted by all ranks of people. Every engraver felt himself to copy it, and thousands of imitations were diffused all over the kingdom. It was made into a pantomime, and performed on the stage. The Rake's Progress, perhaps superior, had not so much success, from want of novelty; nor indeed is the print of the Arrest equal in merit to the other.

"The curtain was now drawn aside, and his genius flood displayed in its full lustre. From time to time he continued to give those works that should be immortal, if the nature of his art will allow it. Even the receipts for his subscriptions had wit in them. Many of his plates he engraved himself, and often expunged faces etched by his affiliants when they had not done justice to his ideas.

"Not content with fining in a path untridden before, he was ambitious of distinguishing himself as a painter of his history. But the genius that had entered so feelingly into the calamities and crimes of familiar life, deserted him in a walk that called for dignity and grace. The burlesque turn of his mind mixed itself with the most frivolous subjects. In his Danae the old nurse tries a coin of the golden flower with her teeth, to prove if it be gold; in the Pool of Bethesda, a servant of a rich ulcerated lady beats back a poor man that sought the fame celestial remedy. Both circumstances are juttly thought, but rather too ludicrous. It is a much more capital fault that Danaë herself is a mere nymph of Drury. He seems to have conceived no higher idea of beauty.

"So little had he eyes to his own deficiencies, that he believed he had discovered the principle of grace. With the enthusiasm of a discoverer, he cried, Eureka! This was his famous line of beauty, the ground-work of his Analysis, a book that has many felible hints and obstructions, but that did not carry the conviction, nor meet the universal acquiescence he expected.

"He fell afterwards into a groffer mistake. From a contempt of the ignorant virtuosi of the age, and from indignation at the impudent tricks of picture-dealers, whom he saw continually recommending and vendering vile copies to bubble-collectors, and from having never studied, indeed having seen few good pictures of the great Italian masters, he persuaded himself that the prints engraved on those glorious works were nothing but the effects of prejudice. He talked this language till he believed it; and having heard it often asserted, as is true that time gives a mellowness to colours and improves them, he not only denied the proposition, but maintained that pictures only grew black and worse by age, not dilling-siling between the degrees in which the proposition might be true or false. He went farther; he determined to rival the ancients—and, unfortunately, chose one of the finest pictures in England as the object of his competition. This was the celebrated Sigismonda of Sir Luke Schaub, now in the possession of the duke of Newcastle, said to be painted by Correggio, probably by Farn, but no matter by whom. It is impossible to see the picture, or read Dryden's inimitable tale, and not feel that the same soul animated both. After many effays, Hogarth at last produced his Sigismonda—but no more like Sigismonda, than I to Hercules. None of the sober grief, no dignity of suppressed anguish, no involuntary tear, no settled meditation on the fate they meant to meet, no amorous warmth turned holy by despair; in short, all was wanting that should have been there. He felt the price of 400l. on it, and had it returned on his hands by the perfon for whom it was painted. He took subscriptions for a plate of it, but had the sense at last to suppress it. I make no more apology for this account than for the encomiums I have bestowed on him. Both are dictated by truth, and are the history of a great man's excellencies and errors. Milton, it is said preferred his Paradise Regained to his immortal poem.

"The last memorable event of our artist's life was his quarrel with Mr. Wilkes, in which, if Mr. Hogarth did not commence direct hostilities on the latter, he at least obliquely gave the first offence, by an attack on the friends and party of that gentleman. This conduct was the more surpizing, as he had all his life avoided dipping his pencil in political contests, and had early refused a very lucrative offer that was made to engage him in a set of prints against the head of a court-party. Without entering into the merits of the cause, I shall only state the fact. In September 1762 Mr. Hogarth published his print of the Times. It was answered by Mr. Wilkes in a severe North-Briton. On this the painter exhibited the caricature of the writer. Mr. Churchill, the poet, then engaged in the war, and wrote his epistle to Hogarth, not the brilliant of his works, and in which the fevered strokes fell on a defect that the painter had neither cauful nor could amend—his age; and which, however, was neither remarkable nor decrepit; much less had it impaired his talents, as appeared by his having composed but five months before one of his most capital works, the satire on the Methodists. In revenge for this epistle, Hogarth caricatured Churchill under the form of a canonical bear, with a club and a pot of porter—et vitulé, tu dignus et hic—never did two angry men of their abilities throw mud with less dexterity.

"He fell about twenty-four of his principal pictures by auction in 1745. Mr. Vincent Bourne addressed a copy of Latin hencedcalllables to him on his chief pictures; and Roquet, the enameller, published a French explanation, though a superficial one, of many of his prints, which it was said, he had drawn up for the use of marchal Belleffe, then a prisoner in England."
HOGG, in Geography, a town of Austria; 12 miles S.W. Freytlad.
HOGGEREL, a name that signifies the same thing with hog-heap, in particular districts.
HOGGET, or Hogrel, is a young boar of the second year.
HOGGIT denotes the male or weder sheep, from the period of taking it from the ewe, to the time of its attaining the age of one year.
HOGI, in the Eastern Churches, as at Cairo, is an under attendant on the mofoque, who is the reader under the sheick.
HOGKNE, in Geography, a town of Afiric Turkey, in the government of Moful; 32 miles W. of Moful.
HOGLAND, a town of Norway, in the diocese of Aggerhus; 32 miles N. of Frederikshald.
HOGOE, properly Haut-Gout, a mias in cookery, fo denominated from its high favour, or relish.
HOGOLIN, or Hogoles, in Geography, one of the Caroline Islands, or New Philippiens; about 90 British miles in length, by 40 in breadth.
HÔGSBY, a town of Sweden, in the province of Smalund; 33 miles N. of Calmar.
HÔGSHED, a measure of capacity, and is of several kinds; viz.
HÔGSHED of Ale or Beer, in the country, is 51 ale gallons = 204 ale quarts = 408 ale pints = 4 buccal quarts = 6 country firkins = 6 country bush of beer.
HÔGSHED of London ale, is 54 ale gallons = 216 ale quarts = 432 ale pints = 1½ London barrel = 3 London beer firkins = 6 London bush of beer.
HÔGSHED of Wine, is 13 wine gallons = 108 wine quarts = 216 wine pints = 886 wine gills = 1¾ London ale.
HÔGSHED of Wine, is 13 wine gallons = 108 wine quarts = 216 wine pints = 886 wine gills = 1¾ London ale.
HÔGSHED of Water, in Geography, according to Beighton, Harris (Lexicon Tech. Meafures and Smeaton’s Rep. vol. i. p. 214.) is 63 ale gallons = 1770 cubic inches = 10.28125 cubic feet = 3¼ gallons = 29.51732 cubic links. Dr. Defaguller used the London beer hoghead of 54 gallons in his experiments on pumping.
HÔGSHED of Lime in Somersetshire, is five heaped bushels or bags, (see Bath Soc. Papers, vol. x. p. 58.) = 075125 carriages.
HÔGSIO, in Geography, a town of Sweden, in the province of Angermanland; 14 miles N.N.W. of Hernomland.
HÔGsta, a town of Sweden, in the province of Upland; 7 miles N. of Upfal.
HÔGSTIES, one of the small Bahamas islands, surronded with rocks. N. lat. 21°40’. W. long. 73°50’.
HÔGSUND, a town of Norway, in the province of Aggerhus; 23 miles S.W. of Chriftillania.
HÔGUE, La., a town of France, in the department of the Channel; opposite to which was fought, in 1662, the battle of la Hogue, in which the English fleet, under admiral Russel, obtained a glorious victory over the French, and 15 French men of war were taken, burned, or destroyed; 5 miles S. of Barfleur. N. lat. 49°35’. W. long. 1°11’.
HÔGUE, Belle, a cape on the N. coast of the island of Jersey; 5 miles N. of St. Helier.
HÔGWAHTA, a town of Sweden, in Karmelad; 30 miles N.W. of Carlstadt.
HÔHENBERG, a county and principality of Germany, situated between Wurtemberg and the Austrian Briffag. It is divided into Upper and Lower counties, lying at some distance from each other. The chief towns are Rotenburg, Ehingen, Hord, and Schramberg.—Alfo, a town of Germany, in the principality of Bayreuth; 10 miles E.N.E. of Wunfiedel.—Alfo, a town of the bishropic of Bamberg; 5 miles E.N.E. of Kupferberg.
HÔHENBURG, a town of Austria, on the river Trafen; 20 miles W. of Ebenfurth.
HÔHENEC, a town and cattle of Germany, in the principality of Bayreuth; 14 miles N. of Anpach.
HÔHEN-ELB, a town of Bohemia, in the circle of Königigratz; 23 miles N. of Königigratz. N. lat. 50°30’. E. long. 15°30’.
HÔHENEMBS, a county and principality situated to the S. of the lake of Conflance.
HÔHENESTED, a town of the duchy of Holsteine; 10 miles S.W. of Nordtrop.
HÔHENFELS, a town of Bavaria, in the lordship of Brienetenck; 17 miles N.N.W. of Ratibon.
HÔHEN-FREDERG, a town of Silefia, in the province of Schweidnitz; 5 miles N.N.W. of Freyburg.
HÔHENFURT, a town of Bohemia, on the Molda; 4 miles S.S.W. of Rosenfîrd.
HÔHEN-LEMBURG, a town of Germany, in the county of Mark; 9 miles S. of Schwier.
HÔHENLOE, or Holach, a county and principality of Germany, W. of the margravate of Anpach, about 26 miles from N. to S. and 23 from E. to W. ; conflating of mountaines, vallies, and plains. The southern parts abound with vineyards, and the northern are cultivated for corn ; the vallies have excellent meadowes and paffure land, which feed great numbers of a valuable kind of cattle: and the mountaines are clothed with oak, fir, pine, beech, and birch; and supply
supply plenty of game. The inhabitants are chiefly Lutherans, intermixed with some Roman Catholics.

Hohenmaut, or Wissoky-Meyto, a town of Bohemia, in the circle of Chrudim, with a small territory annexed; 14 miles E. of Chrudim. N. lat. 49° 54'. E. long. 15° 56'.

Hohenbuchau, a town and castle of Bavaria, near which are iron mines and forges; 70 miles W. of Salzburg.

Hohen-Solms, a town of Germany, whence a branch of the family of Solms derives the title of count, situated in a valley near a high mountain, and inhabited by Calvinists, though the surrounding villages are occupied by Lutherans; 5 miles N.N.E. of Wetzlar. N. lat. 50° 38'. E. long. 8° 55'.

Hohenstadt, or Zarek, a town of Moravia, in the circle of Olmutz; 24 miles N.W. of Olmutz. N. lat. 49° 49'. E. long. 61° 41'.

Hohenstein, a town of Prussia, in the province of Oberland, with a castle. N. lat. 53° 27'. E. long. 20° 15'.

—Allo, a town of Saxony, in the margravate of Meissen; 9 miles E.N.E. of Pirna. N. lat. 50° 56'. E. long. 14° 10'.

Hohenwart, a town of Bavaria; 9 miles S. of Ingolstadt.

Hohenzollern, a principality of Germany, divided into three branches, viz. Hohenzollern, Hekkingen, and Hohenzollern Sigmaringen; each prince having a revenue of about 30,000 florins.

Hohnstein, a county of Westphalia, situated in Thuringia.

Hofet, a small island in the East Indian sea, near the coast of Queda. N. lat. 6° 36'. E. long. 99° 47'.

Holamsa, a town on the E. coast of the island of Celebes. N. lat. 0° 51'. E. long. 124° 59'.

Hoin, a town of Perla, in the province of Adirbeizan; 42 miles S.S.E. of Ardebil.

Hoist, in Sea Language, denotes the perpendicular height of a flax or enflag, as opposed to the fly, which signifies its breadth from the flax to the outer edge.

Hoisting signifies the operation of drawing up any body by the assistance of one or more tackles. Hoisting is never applied to the act of pulling up any body by the help of a single block, except in the exercise of extending the sail, by drawing them upwards along the mast or stay, to which it is invariably applied.

Hoisting jack, in Mechanics, is a machine used for raising large weights to small heights, under which they can be placed. They are of two kinds; one in which a rack is pushed upwards by means of a pinion and winch-handle, and wheels, when great power is required; and others, in which a screw is moved upwards by means of a revolving nut, turned by a lever. In the Repository of the Society of Arts in the Adelphi, two models of hoisting-jacks are preferred for public inspection, viz. Mr. Abraham Staghold's, a cast iron. No. 47; the second, described in the Magasin des Arts, vol. i. p. 319, and Bailey's Machines, vol. i. p. 168; and Mr. William Moock's cast iron. No. 116. vol. vi. p. 239, and vol. viii. p. 179. See Jack.

Hoisting tackle, is an ingenious and very efficient way of raising weights, lately introduced very extensively by Mr. Simeon Thompson, who has a patent for its application.

Hoitzallotl, in Ornithology, the courier plebeian of Latham. See Passusius Mexicanus.

Eff. Ch. Corolla falver-shaped, with equilateral segments; its orifice and tube dilate of scales. Stamens incolored in the tube, and inserted into its base; anthors unconnected with the fligma, lanceolate, entire, burling lengthwise. German two; style very short; stigma common, cylindrical. No scales at the base of the germens. Follicles slender.

This genus consists of two species, natives of Ceylon or other parts of the East Indies. One of them is Carilla nitris, Vahl. Symb. fasc. 3. 44, so named originally by Koemig, from whom there is a specimen in the Bankian herbarium. They are upright smooth shrubs, with membranous leaves. The flowers grow in terminal and lateral cymes.

HOLBEACH, in Geography, is an ancient market-town, and parish in the wapentake of Elloe, Holland division of Lincolnshire, England. It is situated in the Fen, and very indifferently built. A grant of a weekly market and an annual fair was obtained from Henry III. by Thomas de Malton, lord Egremont, about the middle of the thirteenth century; when a stone cross was erected in the market-place. The chief building in Holbeach is the church, which is a large handom frument; and consists of a nave, chancel, aisles, porch, and square tower, with an octangular ornamental spire. The north porch has two circular towers, with embattled parapets, at its extreme angles. The church contains some fine monuments. An hospital was establithed and endowed in this town by sir John de Kirtot, knt. about the year 1350, for the support of a warden, chaplain, and fourteen penitents. A free grammar-school was also founded here about the same time by a licence from king Edward III., who granted certain lands for its support. Another free-school was establithed here about the year 1679, by George Farmer, esq. and the revenues for its support have been much incrased by subsequent donations and bequests. Holbeach is 150 miles distant from London, and contains 355 houses, occupied by 2053 persons. This town has derived some honor from two eminent natives: Henry de Randis, called, from the place of his birth, Holbech, who was bishop of Lincoln in the reign of Edward VI.; and Dr. William Stukley, whose name and memory are respected by every admirer of English antiquities.

The village of Gedney, a mile and half distant from Holbeach, is worthy notice for the lightness of its church, which has fifty-three windows; in those of the north aisle are considerables remains of fine painted glass. Beauties of England, vol. ix.

HOLBECK, a sea-port town of Denmark, in the island of Zealand, situated in the gulf of Hfiedorf, with a good harbour, whence considerable quantities of corn are annually exported; 30 miles W. from Copenhagen. N. lat. 55° 42'. E. long. 11° 44'.

HOLBEIN, JOHN, or Hans, in Biography. This admired painter was born at Basle in 1488, and instructed in the art by his father John Holbein. In the early part of his life he pursued his studies with incessant affiduity; and being possessed of an elevated genius, his progress was exceedingly rapid, so that he soon became far superior to his instructor. He excelled all his contemporaries in portrait; and in that style arrived at so high a degree of perfection, that Zuccheri, who certainly was well qualified to judge of his merit, did not hesitate to compare his portraits with those of Raphael and Titian.

He painted equally well in oil, water-colours, and dintsiper, in large and in miniature; but he had never practised the art of painting in miniature, till he resided in England, and learned it from Lucas Corneilius; though he afterward, carried it to its highest perfection. His paintings of that kind have all the force of oil-colours, and are finished with the utmost delicacy. In general he painted on a green ground, but in his small pictures frequently he painted on a blue.

The invention of Holbein was surprizingly fruitful, and often poetical; his execution was remarkably quick, and his application indefatigable. His pencil was excessively delicate; his colouring had a wonderful degree of force; he finished his pictures with exquisite neatness; and his carnations were life itself. His genuine works are always distinguishable by the true, round, lively imitation of flesh, visible in all his portraits, and also by the amazing delicacy of his finishing.

He visited London at the request of Erasmus, who recommended him to sir Thomas More; and sir Thomas immediately employed him, showed him every mark of respect and real friendship, entertained him at his own table, allowed him an apartment in his house, and retained him for three years. In which time he painted the portraits of his patron, and all the family of sir Thomas; as also several portraits of his relations and friends, which were hung up in a grand hall. As soon as king Henry VIII. beheld those performances, he was so struck with their beauty, their life, and admirable likenesses, that he took Holbein into his service, and favoured him highly as long as he lived.

It is observed by most authors, that Holbein always painted with his left hand; though one modern writer objects against that tradition, (what he considers as a proof,) that in a portrait of Holbein painted by himself, which was in the Arundelian collection, he is represented holding the pencil in the right hand. But, with great deference to the opinion of that ingenious connoisseur, that evidence cannot be sufficient to set aside so general a testimony of the most authentic writers on this subject; because, although habit and practice might enable him to handle the pencil familiarly with his left hand, yet, as it is so unusual, it must have bad but an unseemly and awkward appearance in a picture; which probably might have been his real inducement for representing himself without such a particularity. Besides, the writer of Holbein's life, at the end of the treatise of Dr. Pile, mentions a print by Holler, still extant, which describes Holbein drawing with his left hand. Nor is it so extraordinary or incredible a circumstance; for other artists, mentioned in this volume, are remarked for the very same habit; particularly Mozzo of Antwerp, who worked with the left; and Amico Aperforino, as well as Ludovico Cafaggiato, who worked equally well with both hands.

The genius and excellence of this master were sufficiently shown in the historical style, by two celebrated compositions which he painted in the hall of the Steelyard company; and they were universally admired for the riches of the colouring, as also for the strong character in the figures through the whole. Zuccheri, on seeing these pictures, expressed the highest esteem for Holbein, and even copied them in Indian ink.

Holbein undoubtedly had many excellencies, which procured him, very deservedly, the admiration of all Europe; but to equal him in portrait with Raphael and Titian, as Zuccheri did, or to place him on an equality with the best
of Raphael's discipies in composition, as Abbé du Bos has done, seems to be not altogether justifiable; for, notwithstanding the abundant merit of this matter in many respects, it cannot be denied that the German taste predominates through most, if not all, of his compositions.

It is indeed to be lamented, that such a number of pictures are positively ascribed to be the hand of Holbein, which are a disfigurement to his pencil; but any judicious person, who hath observed one genuine picture, will not easily be imposed on.

In the Florentine collection are the portraits of Holbein, Luther, Sir Thomas More, and Richard Southwell, all painted by this master; and in the cabinet of the king of France, besides several portraits, there is an historical subject by Holbein, representing the "Sacrifice of Abraham," which is accounted a fine performance. He died in 1564, aged 56.

**Holborne Isle**, in Geography, a small island near the N.E. coast of New Holland; 20 miles N.W. of cape Gloucester.

**Holberg**, Louis, Baron Ven, in Biography, a celebrated Danish writer, was born at Bergen, in Norway, about the year 1685. Owing to the early death of his parents, who had brought up a numerous family very respectably, he first went into the army, and then discovering an attachement to learning, he was put under the care of a private tutor by a near relation. The frights and horror of his own, and likewise of his friends' circumstances, was the cause of the many vicissitudes which he experienced before he had attained to man's estate. At length he completed his studies at Copenhagen, and then returned to his native place, where he became private tutor in the family of the suffragan of the bishop of Bergen. His temper was ill adapted to the station, and in a few weeks he collected what money he was able to procure and set off for Holland. His resources were soon exhausted, and he was glad to return, directing his course to Christianland, where he obtained a living by teaching the languages. After this he went to England; and at Oxford his skill in music and the learned tongues obtained for him many pupils. His love of change had hitherto kept him in a state of poverty, and though he had many good offers, some of which he accepted, yet he never stayed long enough in one place to benefit by them. He dedicated his "Introduction to the Modern History of France" to Frederic IV. which procured for him the place of an extraordinary professor at Copenhagen, where he had a very short time, when he travelled, by the way of the Netherlands, into France. After a considerable stay at Paris he went to Rome, where he spent a winter, and then returned to the French capital by way of Florence, Bologna, Turin, and Lyons. He next went to Capuchinland, where he published, in the Danish language, "An Introduction to the Law of Nature and Nations." After this he obtained an appointment which raised him above poverty, being made professor of metaphysics, though, according to his own account of the matter, it was one of the subjects with which he was least acquainted. This promotion was followed by a place in the consistory, which gave him a higher rank, and made a farther addition to his income. His reputation as a writer being established, he frequently appeared before the world as an author, and in 1735 he became rector of the university of Copenhagen, and in two years after he was entrusted with the management of its finances. While at the head of the university, he exerted himself to promote the interests of learning, and gave prizes to those students who excelled in the different branches of literature. He was a successful author, and obtaining much property by his literary labours, he purchased an estate in Iceland, and at his death, which happened in 1754, he bequeathed a large sum of money to the academy of Soroe in Iceland, for the purpose of educating young nobility, on which account his memory has been celebrated by an annual oration. Holberg possessed a strong turn for satire and ridicule, of which he gave an admirable specimen in "Klimm's Subterranean Travels, containing a new Theory of the Earth, with a Description of the Fifth Monarchy, which hitherto has been totally unknown." This work has gone through many editions, and been translated into different languages. It is thus described by one of the translators: "Holberg's acuteness in discovering the imperfections of most governments, the instructive manner in which he criticises, and which evidently displays a philosophical mind and depth of judgment; his accurate spirit of observation; his lively ridicule which, for the most part, is under the veil of philanthropy and naiveté, together with the elegance of the style, not only obtained a favourable reception to this work on its first appearance, but will secure it for ages. On account of the romantic event it records, it may be classed with Lucian's "True History," or "Gulliver's Travels:" but it exceeds both in variety of matter, as well as in delicacy of fable. Lucian only laughs, and Swift is too bitter, whereas Holberg flows a middle course between both." In his country baron Holberg is principally known by his "Introduction to Universal History," which was translated many years since by Dr. Gregory Sharpe; and a new edition of this work was given to the public in 1789, by William Rakcliffe, A.B. Of the baron Dr. Sharpe says, "he was author of many works in prose and verse, almost all of them written in the Danish language. He wrote 25 plays, a metamorphosis, the reverse of Ovid's, relating the change of flowers, trees, and animals into men; he was the author of several satires in verse; of the entertaining voyage under ground of Klinma, in Latin, called "Soroe Subterraneum;" of some epigrams; of his own life; of an excellent ecclesiastical history; another of the Danes, and one of the Jews, with several moral, historical, and other pieces; and he was always in firm and studious, had travelled much, and loved and imitated the manners of the English." See Dr. Sharpe's preface to the Introduction to Universal History.

**Holborn Head**, in Geography, a cape of Scotland, on the N. coast of the county of Caithness. N. lat. 51° 39' W. long. 3° 20'.

**Holce**, Oar, a word used by some of the Greek authors, as the name of a dram weight; and by others, as Dioeceses, &c. to signify a weight in general.

**Holcombe, Henry**, in Biography, was a chorister in the cathedral of Salisbury, and having a very fine treble voice, was sent for up to London, to perform in the first attempts at operas on the Italian model. In "Camilla," he performed the part of Fransco; and being very young at that time, it was called, in the printed copy of the music, the boy. In Rosamond, he performed the part of the page, under the same title. His voice breaking, he soon after quitted the stage, and became a music-maker. He had many scholars, particularly in singing; for which, from constantly frequenting the operas, after he had ceased to perform there, and hearing all the great singers from Valentini and Nicolini, to Sennino and Farinelli, he must have been well qualified, and we have been assured by very good judges, who had often heard him sing in private, that his taste was perfectly Italian.

One
One song only of his composition, "Happy hours, all hours excelling," is printed in the Musical Miscellany.

But his elegant ballad of "Arno's Vale," written on the death of Gallon, the last duke of Tuscany, of the house of Medici, by Charles Earl of Middlesex, afterwards duke of Dorset, and addressed to his favourite, the Mufcovia, a finger, was afterwards in great favour, and printed in a collection of twelve songs set by Holcombe, and published a short time before his death, which happened about the year 1752.

HOLCUS, in Botan., a name in Pliny, lib. of the Greeks, and by the ancients underbod as a kind of wild barley, with awns, growing in dry fliny places. Professor Martyn deduces it from *lucus, a forest*, but we do not find this etymology, nor any other that has fallen in our way, satisfactory. The name, as applied by Linnaeus, embraces a heterogeneous assemblage, in which is the *Sorghum* of the ancients; but some species have of late been removed from it; (see Herrichores.) Mr. Brown, in his Prod. Nov. Holl., wishes to confine the genus nearly to that peculiar tribe to which the *Sorghum* belongs, and which is well illustrated by Mieg in the *Alta Holcctica*, v. 8. 114. t. 8, this last-named author expressing a desire that such might be separated, under the name of *Sorghum*, as a distinct genus from the *Holcus* of Linnaeus. To this we gladly assent, and then perhaps our English species, *mollis, lanatus*, and *avenaceus*, may serve as the basis of *Holcus*, for we cannot agree with Haller and Mieg to refer the two last, any more than the last, to *Avena*. In pursuance of this plan, we shall for the present put aside *Sorghum*, for the consideration of ourselves or our successors in its proper place. The following therefore will be the characters and synonyms of our *Holcus*.

Gen. Ch. Cal. Glume of two valves, erect, beardless, ovate, containing two florets; one of them elevated on a stalk. Cor. of two valves; the lower or outer one large, awned at the back in the least perfect floret. Nectary a cloven membranous scale. Stam. Filaments three in each floret, capillary, rather short; anthers long, linear, cloven at each end. Fil. Germ. ovate; styles two, capillary, diverging; stigmas oblong, feathery. One floret has either no pillit, or only an imperfect one. Petio. none, except the permanent glumes. Seed solitary, ovate, attached to the hardened corolla.

Eff. Ch. Calyx of two valves, two-flowered; one floret with an imperfect stam. Corolla of two valves; the outer one awned.

1. *H. lanatus*. Meadow Soft-grafs. Linn. Sp. Pl. 1485. Curt. Lond. fasc. 4. t. 11. Schreb. Gram. 145. t. 20. f. 1. Sm. Eng. Bot. t. 1169. Knapp. t. 37. Leers. 219. t. 7. f. 6. (Gramen pratenae paniculatum moll; Schuethz. Agrof. 234. t. 4. f. 24, A. B.)—Calyx-glumes woolly. Lower floret beardless; upper with an arched recurved awn. Leaves downy on both sides. —Abundant in meadows and pastures throughout Europe, especially where the ground is sandy, flowering in June and July. The roots are perennial, fibrous, tufted, not creeping. Stems several, a foot or two in height, simple, erect, leafy, jointed, clothed with soft, deflexed, dense hairs. Leaves flat, not greyish, clothed on both sides, but especially beneath, with similar pubescence; the sheaths of the uppermost longest and swelling. Stipula short and blunt. Panicle erect, compound, dense, downy, hoary, moily with a purplish tinge; its ultimate flasks capillary. Calyx-cells nearly equal in length, the innermost broadened. Florets not rising above the calyx; the upper one scarcely ever having any pillit. Its outer glume is blunt, terminating in a smallawn, which, when the flowers are arrived at full maturity, is recurved in an arched manner, and is well compared by Schuethz to a fishing hook. This grass is mown for hay, along with any others that happen to grow with it, but has not been recommended for particular cultivation.

2. *H. mollis*. Creeping Soft-grafs. —Linn. Sp. Pl. 1485. Curt. Lond. fasc. 5. t. 8. Schreb. Gram. 149. t. 22. f. 2. Sm. Eng. Bot. t. 1170. Knapp. t. 58. Leers. 218. t. 7. f. 7. (Gramen eumultatum paniculatum moll; Schuethz. Agrof. 235. t. 4. f. 25.)—Calyx-glumes partly naked. Lower floret beardless, upper with a sharply-bent awn. Root creeping. —Native of sandy copes and hedgerows, but much less frequent than the former, from which it is distinguished by its creeping root. and the acute angle formed by the awn of the male floret when ripe and dry. It is moreover a more slender and less downy grass, with a smaller panicle, but larger flowers, and more prominent awns. It blossoms in July, and is considered of no value to the husbandman, but rather nosious, as a kind of couch-grass. The widely-spread roots are, indeed, in some situations, difficult of extirpation, but they do not thrive in open land.

Schader makes a species, under the name of *H. bulbosus*, of what we consider as a variety of this, growing in cultivated fields, and thence, if we mistake not, acquiring rather more bulbs, and downy joints to the stem, both circular and originating probably from a more expanded and dry sation than is natural to it. Gramen bulbosum nodosum, Lobel. Ic. v. 1. 25; is considered as a representation of this.

H. *latissimus* of Linnaeus, by his character of the florets, should seem to belong to this genus, but its racemose habit is very dissimilar, and the flowers require to be examined by those who have access to them alive. It grows in North America, and has the habit, but not the character, of Michaux's *Festuca divarica*, Boreal. Amer. v. 1. 67. t. 10.

H. *fricius*. Linn. is the very same thing as his *Panicea curvata*.

H. *ferratus*. Linn. Suppl. 433, found at the Cape by Thumberg, is probably of some other genus, possibly a *Sorghum*. Its strongly ferrated *laves* are extremely peculiar.

H. *latifolius*. Linn. Sp. Pl. 1486, is also Cerclusian Jappacens of the same work, two pages forward. This is an East Indian grass, with three or four irregularly barred florets in each calyx, quite unlike a genuine *Holcus*, but we cannot
cannot investigate its flowers, so as to decide, with any certainty, concerning its true genus. Hulcus, in Agriculture, the name by which a genus of grasses is known; but few of the species of which are found useful to the farmer. It signifies soft grass.

Hulcus lanatus, the meadow soft grass, which is supposed, by Mr. Curtis, to be a very common grass in all meadows and pastures, as well as in waste grounds and woods newly cut down, and which is also hardy, as well as productive of foliage, flowering a month later than the anthoxanthum, and when its red panicle appears, it is considered by the farmers that their grasses are ready for the seyce. Its foliage is soft and woolly, which, if not disliked by cattle on that account, may, if it is supposed, rank with some of the best grasses; if it were more curly, it would, however, be more valuable. It is not, however, thought so well of by Mr. Sule; as from its particular softness, he cannot conceive it excellent either as a pasture or hay grass. It is the grass which is usually known to farmers in this country by the name of Yorkshire-white.

Hulcus mollis, the name by which the creeping soft grasses is known. It has been suggested by Mr. Curtis in his "Tract on Grasses," that he is induced to think better of it now, than when he figured and described it in his "Flora Londinensis," having found that it will grow well in a sandy soil, and bear the drought of summer, better than most others. And it is added that captain Dorset is of opinion that it may even be cultivated to advantage in soils of the barren sandy kind.

Hold, in the Manage. See Tain.

Hold, in Rural Economy, a term applied to female animals, which after being covered or connected with the males, without miscarrying, are said to be hold.

Hold, of a ship, the lowest part of the ship, including all that part of her frame lying between the floor and the lower deck, through her whole length.

The hold is the store-room in a merchant ship, or the place wherein the goods, at least all the heavier and more cumbersome, are stored: the rest are disposed between the two decks; at least in Dutch ships, which have their holds very shallow, and the space between the decks very high. The hold contains the ballast, provisions, and stores, of a ship of war. The several store-rooms are separated by bulkheads, and are demarcated according to the several articles they contain, the sail-room, the bread-room, the full-room, the spirit-room, &c.

To find the burden of a ship, the hold is to be measured.

Hold, in Sea Language, is understood to signify a particular situation with regard to the shore, by which she is enabled to keep within a sufficient distance, to facilitate her course, or answer some other important object. Keep a good hold of the land, implies to keep near, or in sight of the land.

Hold, after, denotes that part of the hold which lies abaft the main-mast.

Hold, fore, is that part of the hold which is situated in the fore-part of the ship, or before the main hatchway.

Hold its own, at S.a. A ship is said to hold its own, that keeps her course right forward.

Hold, to rummage the, is to remove and clear the goods and things therein.

Hold, precy the, in the Sea Language. See Precy.

Hold, to trim the, See Trim.

Hold, flowing the, a phrase for taking goods into the hold. See Storeage.

Hold, in Music, is a mark, like an arch, with a point in the middle of it, placed over some single notes, which has been used to signify that such note is to be made longer than ordinary; but it now more commonly denotes that the song ends there, and is only used when the song ends with a repetition of the first strain, or part of it.

HOLDE, in our Old Low Books, is used for the ballad of a city or town; and sometimes for a general.

HOLDEN, in Geography, a township of America, in Worcester county, Massachusetts, seven miles N. of Worcester, and 51 W. of Boston; containing 1142 inhabitants.

HOLDEN, John, in Biography, author of an excellent essay towards a rational system of music.

We are unable to give a biographical account of this ingenious author; but his work, which was published at Glas- gow, in long quarto, half bound, in 1770, seems to have been much let by noticed by the public than it deserves. Its principles are good, and explained in clear and correct language. Without discovering a marked partiality for ancient or modern music, or an exclusive predilection for the productions of any particular country or individual, he has endeavoured, and we think with considerable success, to explain the materials with which good compositions are built; and, without pedantry or fantastic innovations, has ranged through the wide extended regions of the art. We will not say that this little treatise (in size) renders all other books on the subject unnecessary, or that the author has left nothing for subsequent writers to do. No; all we mean to say is, that what he has done, is well done; but if his work had been much more voluminous than it is, much must have been left for ingenious, intelligent, and speculative writers to say on the subject, and during the lapse of more than 30 years, since this book appeared, such a rapid progress has been made in the theory and practice of the art, that Mr. Holden, if still an inhabitant of earth, might fill a second volume of his work by describing the new passages and effects in the works of Haydn and Mozart alone, that have delighted the lovers of music, since the publication of his first volume.

The author, in Part I., has treated with clearness and ingenuity the following subjects:

Of the natural scale, 26 sections.
Application of the scale, 9 do.
Of the modern system of music, 22 do.
Of time, 45 do.
Miscellaneous explanations, 15 do.
Harmonical consonances, 26 do.
Of dissonances.
Of fundamental progressions.
Of the flat series.
Of chromatic.
Of plain dissonant.
Figurative melody.

Part II.

Of the theory of music (found).
Single musical sounds.
Of musical sounds in succession.
Of harmonical arithmetic (ratios).
Of combined sounds.

This author is no servile follower of any preceding writer; his precepts seem to arise from experience and reflection.

His calling the pause and final mark, N. 101, a hold, is not a term in use at present. The Italian term for it is corona, or crown. It is, sometimes, colloquially called in England a bull's eye; but it is vulgar.

Indeed,
Indeed, in these chapters we have a musical dictionary, or technique; rules for thorough base harmonies, and many other things, which the titles of the chapters do not promise.

There is in this work no parade of great reading, or knowledge of languages; yet we perceive that the author is not acquainted with Zarlin, Rameau, d'Alembert, Rousseau, and Serre of Geneva.

In the plate facing p. 76, he calls C, with a $\frac{1}{2}$ in the key of G, a fundamental base; but the fundamental base to that chord as 4th of the key, is A with a 7th, and the author seems to be not perfectly familiarized to Rameau's base fundamental.

The plate facing p. 100, is a bad specimen of his abilities in composition. The repeating the same harmony to the first note of a new bar, as had been given to the last note of the preceding bar, will always be found infipid, and what is confantly avoided by contrapuntists of the first class.

He gives us instances of his harmony, but none of his melody; except such as are pfalmodic.

But melody is very hard to teach. Keeping good company, that is, frequently hearing good music, forms the taste, and stimulates invention. A man that hears nothing but psalmody and national tunes, will never produce graceful and elegant melody, or great effects in harmony.

By the decimal fractions of schisms ($\Sigma$) in the third column, it will appear, which of these ratios involve the number 7, which does not belong to the diatonic system, amounting to nearly one-half of the whole number of notes, with which this fanciful system is encumbered.

**Holder, William**, in *Biography, doctor of divinity*, canon of Ely, refiduary of St. Paul's, and sub-dean of the Chapel Royal, not only merits particular notice as an able and learned writer on the theory of music, but as an ecclesiastical composer of anthems, of which three or four are preferred in Dr. Tudd's collection, British Museum. From the regularity and unembarrassed arrangement of the several parts in the specimen of his composition, it is easy to discover, that he had not studied and practised counterpoint in the superficial manner of an idle dilettante, but with the application of a diligent professor.

Besides his eminence as a divine, and deep knowledge in music, he distinguished himself as a philosopher, a mathematician, and a philologist. He was one of the first fellows of the Royal Society, and in treating several curious subjests, since selection and application of words manifest him to have been a consummate master of our language. Indeed, the strength, precision, clearness, and comprension of his style have been hardly ever equalled by any writer on philosophical subjects in our country; particularly in his admirable treatise on the "Elements of Speech," published 1699, and drawn up with the benevolent design of giving relief to a person that was deaf and dumb. In this essay he has analysed, dissected, and classified the letters of our alphabet so minutely and clearly, that it is well worthy the attentive perusal of every lover of philology, but particularly of lyric poets and composers of vocal music; to whom it will point out such harsh and untenable combinations of letters and syllables as from their difficult utterance impede and corrupt the voice in its passage.

In 1694, Dr. Holder published "A Discourse Concerning Time," in which, among other things, the deficiency of the Julian Calendar was explained, and the method of reforming it demonstrated, which was afterwards adopted in the change of style. It is to be lamented that in treating this subject with so much clearness and ability, so good a musician did not extend his reflections on the artificial parts
of time, to its divisions and proportions in musical measures; a subject upon which the Abbate Sacchi has written in Italian, "Del Tempo nella Musica;" but which rhythmically, or metrically considered in common with poetry, has not yet been sufficiently diffused in our own language.

The same year was published by Dr. Holder, "A Treatise on the Natural Grounds of Harmony," in which the propagation of sound, the ratio of vibrations, their coincidence in forming consonance, sympathetic reversion, or pure harmoniques, the difference between arithmetical, geometrical, and harmonic proportions, and the author's opinion concerning the music of the ancients, to whom he denies the use of harmony, or music in parts, are all ably treated and clearly explained, that this book may be read with profit and pleasure by most practical musicians, though unacquainted with geometry, mathematics, and harmonics, or the philosophy of sound. This book is said, in the introduction, to have been drawn up chiefly for the sake and service of the gentlemen of the chapel royal, of which he was sub-dean, and in which, as well as other cathedrals to which his power extended, he is said to have been a severe disciplinarian; for being so excellent a judge and compositor himself, it is natural to suppose that he would be the least likely to tolerate neglect and ignorance in the performance of the choral service.

Michael Wise, who perhaps had fallen under his lash, used to call him Mr. Sub-dean.

Dr. Holder died in 1665, aged 82, and was buried in the subterranean chapel of St. Paul's church, where a marble monument is erected to his memory, with an inscription recounting his titles, talents, and extensive knowledge.

HOLDERNESS, in Geography, a township of America, in Crafton county, New Hampshire, on the E. side of Penigewaffet river, incorporated in 1751, and containing 531 inhabitants; 61 miles N.N.W. of Portsmouth.

HOLD-FAST, an iron hook, in flape of the letter S, fixed in a wall, to retain and support it.

This term also denotes a tool used by joiners, &c., which goes through their benches, to hold fast such work as cannot be thus fastened by being held in the hand.

HOLDING on, in Sea Language, is the act of pulling back the hind-part of any cable, or other rope, which is heaved round by the capitan or windlass, or drawn in by the purchase of a tackle. As there are only a few turns of any rope above the barrel of the capitan or windlass when it is employed in heaving, an equal quantity of the rope will necessarily come off from the capitan at the same time; and this is accordingly pulled back as strongly as possible to prevent it from surging or jerking round the barrel, by being held too loosely; so that holding-on denotes the act of retaining any quantity of rope acquired by the effort of a capitan, windlass, or tackle, as these are employed in hoisting as well as in heaving.

HOLDING water signifies the operation of flattening a boat in her course, by holding the oars in the water, and bearing the blade or flat part strongly against the current made alongside, by her paddling swiftly through the water.

HOLDING over a term, &c., in Law. By 4 Geo. II. cap. 28. in case any tenant for life or years, or other person claiming under or by collation with such tenant, shall wilfully hold over after the determination of the term, and demand made and notice in writing for recovering the possession of the premises, by him to whom the remainder or reversion shall belong; such person so holding over, shall pay for the time he continues at the rate of double the yearly value of the lands so detained. See EJECTMENT and TRESPASS.

HOLDSWORTHY, in Geography, a small market town and parish in the hundred of Black Torrington, Devonshire, England, is situated near the western borders of the county, between two small streams, which fall into the river Tamar, at a small distance. In the year 1801, this town was returned to parliament as containing 204 houses, and 1024 inhabitants; the chief employment of the latter is derived from the operations of agriculture. Holdsworthy is 21 miles W. from London; has a weekly market on Saturdays, and three annual fairs. Polwhele's History and Antiquities of Devonshire.

HOLE, in Anatomy, denotes such a cavity of a bone as penetrates from one side to the other.

HOLE, in Burton's Catechism, denotes a place of confinement, eighteen feet by eighteen feet, containing three hundred and twenty-four square feet, in which a hundred and forty-six persons were shut up by order of the vicerey; so that there was a figure for each person of twenty-four inches and a half by twelve inches, which was just sufficient to hold them, without pressing violently upon each other. To this dungeon there was only one small grated window; and the weather being very sultry, the air within could neither circulate nor be changed. In less than an hour after their being enclosed, many of the unhappy people were seized with extreme difficulty of breathing, several were delirious, and the place was filled with incoherent ravings and exclamations of distress; the cry of water! water! was predominant. This was handed to them by the cenobites, but had no effect in allaying their thirst. In less than four hours, many were suffocated, or died in violent deliriums. In an hour more, the survivors, except a few at the grate, were to the highest degree phrenetic and outrageous. At length those at the grate became so inensible, that we have no account of what happened, till they were released at six o'clock next morning, having been confined from seven the preceding evening. Such were the effects of an infusion in a cloze and unventilated place, in the space of eleven hours, that out of a hundred and forty-six persons, no more than twenty-three came out alive, and those in a high putrid fever, of which, however, by fresh air, &c. they gradually recovered.

HOLLE, in Geography, a town of Norway, in the diocese of Aggerhus; 15 miles N.W. of Chrilliania.

HOLE town, a town on the W. coast of the island of Barbadoes. N. lat. 13° 12'. W. long. 38° 51'.

HOLE, in Mining, signifies the act of hoisting, clearing, kiving, curving, under-going, or under-mining the face or bank of coal in a coal-pit; preparatory to its being fell or wheeled down, the proceed of which will be found in Mr. Frey's Report on Derbyshire, vol. i.

HOLEING, signifies the under-mining or loosening of coals in a pit. See Hole.

HOLEING-fluff, signifies the small earth or coals which is cut or picked out from under the coal in a pit: the small coals thus obtained are sometimes holeing-coal, flack, &c.

HOLEN, in Geography, a town of Norway, in the diocese of Aggerhus; 18 miles from Tonberg.

HOLENECK, a town of the duchy of Sutria; 10 miles S. of Voihtberg.

HOLERS, in Mining, are a set of colliers, whose business it is, during the night, where coals are worked the long way, to hole, or undermine the banks or face of coal, ready for the next day's work.

HOLESCHAU, or HOLESOW, in Geography, a town of Moravia, in the circle of Poreivau; 20 miles S. E. of Olmutz. N. lat. 49° 18'. E. long. 17° 32'.

HOLIBUT, or HOLICUT, in Ichthyology, a name given by the people of some parts of England to the turbot in ge-
HOLINGSHED, RALPH, in *Biography*, an English chronicler, descended from a family settled at Bolney in Sussex, was educated at Cambridge, where he is said to have taken his degree of M. A. in 1544. He lived in some capacity, probably as steward, with Thomas Burdett, esq., of Bromecote in Warwickshire, at which place he died about the year 1580. Holingshed has given name to a compilation of English history from the earliest periods, of which the first edition was published at London in 1577, in two volumesfolio. The second edition was published ten years after, and brought down the history to the preceding year. Holingshed was employed by Reginald Wolfe, printer to the queen; and he was afflicted by several other perils, and upon his death it was continued by John Rowe. Very considerable refirements from the first edition were made in the second and third, of those parts which were not agreeable to Elizabeth and her minions, by order of the privy council. And the tediousness and vulgarity of these chronological and geographical facts, and many errors are to be found, highly useful in elucidating the manners and customs of the more early periods. *Biog., Brit.*

HOLISTHEMA, in *Surgery*, a dilocation.

HOLITZ, in *Geography*, a town of Hungary; 32 miles N.W. of Topolcnic.—Alto, a town of Bohemia, in the circle of Chrudim; 10 miles N. E. of Chrudim.

HOLKABERG, a town of Sweden, in East Gothland; 35 miles S.W. of Linkoping.

HOLL, a word which is provincially employed to signify the hollow of a ditch, in contradistinction to the bank or baulk of it.

HOLLAND, PHILEMON, in *Biography*, was born at Chelmsford, in Essex, about the year 1551; and after receiving the rudiments of learning at the grammar-school of that place, was sent to Trinity college, Cambridge, of which he became fellow, and left the university after having taken the degree of M. A. He was appointed a head master of the free-school of Chelmsford, where he had settled of these miserable stations he not only attended avidly to the duties of his office, but served the interests of learning, by undertaking those numerous translations, which gained him the title of *Translator general of the age*. But, as if these occupations were insufficent for the employment of his time, he likewise turned his studies to medicine, and practised in that profession with considerable reputation in his neighbourhood; and at length, rather late in life, he became a doctor of physic, in the university of Cambridge. He was an amiable man in all the relations of private life, and by his habits of temperance and regularity attained his 87th year, not only with the full possession of his intellects, but with his sight so good, notwithstanding his incessant use of it, that he never had occasion to wear spectacles. He continued to translate till his 87th year; and his translations, though devoid of elegance, are accounted faithful and accurate; and afford a memorable proof, how much a single man may perform, if his whole time be employed to advantage. He translated into English "Livy," "Pliny's Natural History," "Plutarch's Morals," "Suetonius," "Ammianus Marcellinus," "Zeno's Cyropaedia," and "Cyril's Brittonian," to the last of which he made several useful additions; and into Latin he translated the geographical part of "Speed's Theatre of Great Britain," and a French "Pharmacopoea of Brice Bauderon." A quibbling epigram upon his translation of Suetonius has often been retailed in jest books.

HOLLAND, in *Contempore*, a fine, white, even, close kind of linen cloth, chiefly used for flirts, flounces, &c.; it is principally wrought in the provinces of Holland, Friesland, and other parts of the United Provinces; whence the appellation.

The principal mart or staple of this cloth is at Haerlem, whither it is sent from most other parts, as soon as wove, there to be whitened in the ensuing spring.

That manufactured in Friesland is the most esteemed, and called Frie Holand. It is the strongest and the best colored of any of that kind: it is never calendared, nor thickenened, as the rest; but it is imported just as it comes from the whitter; it is distinguished by its being yard quarter and half wide; which is half a quarter more than those commonly called Frie Holands, which are not right.

Holland, guile, is very white and fine, and is chiefly used for flirts, being the strongest of any for its finenes, except true Frie. It is but yard wide.

*Holland, Almara,* is a very strong cloth, and wears exceedingly well. It is about yard quarter and half wide.

Holland, in *Geography*, an appellation applied to the seven United Provinces, collectively, viz., Gelderland, Holland, Zealand, Utrecht, Overfjeld, Groningen, and Friesland (which see), but primarily belonging to the chief of them. This country, once a celebrated republic, derives its name from the German word "Holl," synonymous with the English term hollow, and denoting a concave or very low country. The people are called Dutch, from the German "Deutsch," or "Teutisch," but "Deutschland" properly signifies the vast extent of Germany itself, though by the English restricted to a small portion, using a dialect of the German language. These provinces extend from the north of Groningen to the southern boundary along Austrian Flanders and Brabant, about 150 British miles; and in breadth, from the North sea to the kingdom of Westphalia, about 100 British miles. Their content, in square miles, is estimated at 10,000. They form a kind of peninsula, which is divided into N. and S. Holland; the former including all to the N. of Amsterdam, and the latter extending from the flates of Zealand and Brabant to the river Ye. The population has been recently computed at 2,758,612, which, allowing the extent of territory in square miles to be 10,000, will give 275 for each square mile. After the dismemberment the French accounts state the population at 1,881,881. That of Holland, the chief province, has been calculated at 582,000. The country is low and marshy; some part of it being lower than the sea, from the inundation of which it is secured by dykes or dams; and the meadows, which are covered with water in the winter, are dried from it by means of mills, that are contrived for discharging it into the ditches and canals. Without these ditches and canals, serving as drains to the country, the soil would in most parts be incapable of cultivation. Among the marshes that deform the general face of the country, the traveler observes numerous and important cities and towns with admiration, and not without very honourable ideas of the astonishing powers of active industry, which have formed a habitable and enviable abode amidst the greatest natural disadvantages. The marshes, morasses, and heaths, which are characteristic of the different provinces, are however intermixed with groves, gardens, and meadows. Though the general aspect of the country presents an intimate combination of land and water, with few hills and woods, but rather moderate
moderate elevations confiding of baren sand, Holland furnishes little scope for the operations of agriculture, the land being mostly appropriated to pasturage, excepting that small portion of it which is assigned to the culture of maeder and tobacco. In the province of Guelderland, and the barony of Breda, the waste grounds are extensive, being over-run with broom and heath, and the soil being generally a black sand. In the north of Holland, and in Friesland (which fce), the pastures supply such a quantity of good butter as to form a staple article of commerce. The chief rivers of the United Provinces are the Rhine, and the Meuse or Maas, which fce respectively. The lakes are few and of small extent, if we except that which is called the sea of Haarlem, on the north of which is the Ye, a broad piece of water, resembling a creek of the sea rather than a river, which passes by Amsterdam. This country has neither mountains nor elevated wood-lands, nor mines; its horses are chiefly procured from England and Flanders, and for its cows and oxen it is primarily indebted to Holstein. Fifth abound on its shores, and particularly turbot and foals; but its herrings are chiefly obtained from the Northern ocean, by way of the port of Flardinghen, or Vlaardinghen, W. of Rotterdam. The climate of this country is cool and humid, and therefore the drefs of the inhabitants is calculated more for warmth than elegance; the horses and streets, both in the towns and villages, are distinguished by their cleanliness and neatness, and form a contrast to the squalid appearance of the German villages. The temperament of the Dutch is phlegmatic; and they are characterized by labour and perseverance rather than ardent and impetuous activity. Their ruling passion is the love of money. To fuch a degree does this passion prevail, if we may credit the report of a female traveller (Mrs. Radcliffe), that "the infatuation of loving money, not as a mean but an end, is paramount in the mind of almost every Dutchman, whatever may be his other dispositions and qualities; the addiction to it is fervent, inveterate, invincible, and universal, from youth to the feeblest old age." In stature the Dutch are low, and the women are commonly taller than the men; and notwithstanding the predominant passion of the country, the ancient female affection for gold and jewels is not yet eradicated. The moisture of the climate leads to the use of high-leaoned food, and of spirituous liquors. Besides the usual games, the chief amusements of the Dutch, in the days of their prosperity and wealth, were the theatres and the tea-gardens. The opulent merchants took delight in their villas, which were thickly planted among the numerous canals; and though their gardens were small, they were richly fered with tulips, hyacinths, and other flowers of immense value. In winter shotting was a favourite palline; and the canals were crowded with people of all ranks. Others, however, whose means could afford it, amused themselves under the domestic roof, amidst their expensive collections of pictures and prints, which they contrived to render a lucrative article of commerce. The Dutch canals of the United Provinces, which are not fewer numerous than the roads in other countries, have been a means of commercial intercourse as well as of personal amufement, as they have served to augment their inland trade when their foreign commerce has declined, till late measures of the state, carried into effect by the ruler of the continent, have been no less injurious to them than to their neighbours. The chief manufacturers of Holland are linens, pottery, and painted tyles; leather, wax, linum, flarch, paper, and also some articles of woolen, cotton, and silk. In a period of national prosperity and opulence, when their colonies were numerous on the coast of Hindoostan, in Ceylon, at Batavia, and at the Cape of Good Hope, &c. and their maritime power very confiderable, the most valuable branch of their commerce confisted in spices and drugs, brought from their settlements in the East Indies. Their fishery in the northern seas, and on their coasts as well as their own, was an object of importance. At a later period they have derived no small advantage from being the grand depot of commerce between Great Britain and the Continent; but this intercourse is for the present interrupted; and more especially their inland trade with Germany and France, by the canals and Rhine. One of the most profitable articles of this trade confisted in the vast floats of timber which arrived at Dort, from Andemach and other places on the Rhine, and from the German forests. The length of these rafts is from 700 to 1000 feet, and the breadth from 50 to 90, and the floating island was directed by 500 labourers; and it is said, by the female traveller already cited, that the sale of one raft, on its arrival at Dort, occupied several months, and frequently produced more than 35,000Z. perling. The Dutch language is a dialect of the German; and the literature of the United Provinces has sustained an honoured rank. Among those who have contributed to its reputation in this respect we may mention Eranus, Johannes Secundus, or Hans de Twerde, Grotius, Boerhaave, Paul Merula, Adrian Junius, Meurinus, Doula, Heinius, the Younger Vossius, and Hoogerweyden of Leyden, who died in 1794, after having acquired the reputation of being the first Greek scholar in Europe. The largest and most celebrated Latin schools in this country were those at Rotterdam, Breda, Middelburg, Groningen, &c.; and its five universities are Amsterdam, Leyden, Utrecht, Harderwyck, Franeker, and Groningen, besides two inferior colleges at Amsterdam and Deventer. At Haerlem there is an academy of sciences.

The Protestant religion, in the Calvinistic form, prevails through the United Provinces; and the treaty of Union, in 1579, provided for its perpetuity. In 1583, indeed, the flates of Holland proposed, that no other form should be tolerated; but this resolution was widely rejected; and every religion is permitted, on condition that it does not oppose the fundamental laws, or teach any doctrines that are subversive of the state; but employments of any consequence are restricted to Protestants. The ecclesiastical state is composed of four ranks, viz. preceptors at universities, preachers, elders, and deacons; and the government of the church is administered by confibories, chaffes, and fynods. The confibory is the lowest court, commonly confiding of the clergy and elders of a particular town; while a chief fynod of deputies from several, and is commonly assembled three times in the year; a part of its duty being to visit the churches, and watch over the conduct of the clergy. The fynods are either provincial or national; the flt being assembled every year, while the national fynod is only summoned on the most important occasions, when effential doctrines are to be discussed; and the latt of thefe was that of Dort in 1618. The provincial fynods are 53 in number, and consist of 1750 preachers. There are also many Walloon churches diffpered through the provinces, who hold a kind of fynod twice a year, composed of deputies from their own fect. The Roman Catholics are supposed to have 350 churches, ferved by 400 priests. The other chief fects are Lutherans, Romanfrants, or Armenians, who have 43 teachers, Anabaptists, Jews, and a few Quakers. As to the political history of the United Provinces, we may observe, that the original population of this country appears to have been Celtic; but when the Romans conquered the country, it was occupied by the Batavi, the most...
northern people of Belgic Gaul, supposed to be a German or Gothic progeny. (See Batav.) The Frisians, the next people adjoining to the Batavi on the N., extended themselves in the seventh century down to the Schedel. In the eighth century the Frisians were subdued by the Franks under Charles Martel; but both the Frisians and the Franks became intermixed in the population of the country with the Batavians. (See Frisians and Franks.)

Our limits will not allow us to trace the history of these provinces, whilst they continued separate, and in a great measure independent of each other; nor can we detail the various conflicts with which they endeavoured to assert and maintain their liberty against the tyranny of the king of Spain and his emirates. It will be sufficient to take up their history in the year 1566, when Holland and some inferior provinces revolted from the oppressive dominion of Philip II; and thus commenced those singular events, which terminated in the union of Utrecht, Jan. 23d, A.D. 1579. For this purpose, the provinces of Holland, Zealand, Utrecht, Friesland, Groningen, Overfeyl, and Gelderland, met at Utrecht, and signed a mutual alliance, which formed the basis of that commonwealth, which afterwards became so renowned under the appellation of the United Provinces. This treaty of alliance was founded upon the infradiction of the pacification of Ghent; solemly acceded to by Philip, and a late invasion of certain towns in Gelderland. It was not intended by this alliance to divide the seven provinces from the other 10, or to renounce the pacification of Ghent; but its object was to preserve the liberty stipulated in that pacification, by more vigorous operations, and united councils. The chief articles of this union declarative to be recited, and they are as follow: the seven provinces shall unite in interest, as one province, never to be separated or divided by testament, donation, exchange, sale, or agreement; referring to each particular province and city all its privileges, rights, customs, and statutes. In all disputes arising between any of the provinces, the rest shall interpose as mediators. They shall assist each other with life and fortune against every foreign attempt upon any particular province, whether to establish sovereignty, the Catholic religion, arbitrary measures, or whatever else may appear inconsistent with the liberties of the provinces, and the intention of the alliance. All frontier towns belonging to the United Provinces, shall, if old, be fortified at the expense of the provinces; if new, at the joint expense of the states. The public imposts and duties shall be forborne for three months to the highest bidder, and employed with the king's taxes in the public service. No province, city, or member of the union, shall contract an alliance with any foreign prince or power, without the concurrence of all the other members. Foreign powers shall be admitted into the alliance, only by consent of all the contracting parties. As to religion, the provinces of Holland and Zealand shall act in that particular as they think advisable; the rest shall adhere to the purport of the edict published by the archdeacon Mathias, which subscribed, that no man should be oppressed on account of conscience. All the inhabitants, from the age of 18 to 60, shall be trained and disciplined to war. Peace and war shall be declared by the unanimous voice of all the provinces; other matters that concern the internal policy shall be regulated by a majority. The states shall be held in the usual conjunctual manner, and clause shall be deferred to future determination. Finally, the parties agreed, that the interpretation of these articles shall remain in the states-general; but in case of their failing, to decide in the stadtholder. In this grand alliance, sketched out by the prince of Orange, may be discerned the judicious feady counsellor of the master and true patriot. It was so universally approved, that in a short time the cities of Ghent, Nimergues, Arsehein, Leeuwarden, Venlo, Ypres, Antwerp, Breda, Bruges, with several other towns, noblemen and persons of distinction, embraced and signed the union. It was immediately followed with the annexation of the war, unnied by faith or arms, with this motto, "Exercitium et data erant." The history of this interesting struggle, says Pinkerton, has been depicted in stirring colours by the celebrated Grotius, who, in this work forelisk, rivals the acute brevity of Tacitus. At the end of this century the Dutch had established colonies at the Cape of Good Hope, and in the East Indies; and settlements were afterwards gained in South America. During the 17th century they rivalled the English in the empire of the seas; and greatly exceeded them in commercial advantages. After the obstinate naval conflicts in the reign of Charles II. their power began to decline. In 1672, Louis XIV. invaded Holland; and Amsterdam was faved merely by opening the sluices. In 1688, William, the stadtholder of Holland, ascended the throne of England; and a stricter intercourse subsisting between the countries, Holland became the gran channel of the commerce of England with the continent. The stadtholder was declared hereditary in 1747. By the war in 1756, Holland and France were connected, and a French party arose in the country, which opposed the stadtholder; but he was supported by the English. In 1789, a war occurred between Great Britain and Holland, which terminated in 1784, after exposing to Europe the decline and weaknesses of the United Provinces, still further displayed by the entrance of the duke of Brunswick in 1788, who may be said to have subdued them (says Pinkerton) without a blow. As the Dutch joined the coalition against the French, their country fell a prey to the invaders, during the hard frost of the winter of 1795-5; and the stadtholder took refuge in England in 1795. The country was then denominated the Batavian republic; and divided into eight departments, &c. However, these provinces were soon afterwards erected into a kingdom, and affixed by Napoleon the French emperor to his brother Louis. On the 17th of July, 1812, Louis Napoleon abdicated his throne, and it was decreed on the ninth instant, by Napoleon, that it should be united to France; that the city of Amsterdam should be the third city of the empire; that Holland should have six senators, six deputies to the council of state, 25 deputies to the legislative body, and two judges in the court of cassation; and that the officers by sea and land, of whatever rank, should be confirmed in their employment, under commissions to be delivered to them, signed under the emperor's hand, the royal guard being united to the imperial guard. The emperor's decree announces other provision enactments for the management of the administration, finances, &c. The imperial decree has been since executed.

Under their former government, the United Provinces were composed of seven republics, each retaining its own state, consisting of nobles and burgesses. The provincial states sent deputies to the States-general, each republic having only one vote, though its deputies may be numerous. But the States-general seldom exceeded twenty-six persons, who used to assemble in a small room at the Hague, enjoying the right of peace and war, appointing and receiving ambassadors, naming the greffier, or secretary of state, and all the civil officers. The council of state directed the army and finances; and what was called the council of deputies considered the troops and finances of each province. The grand
penionary of Holland presided in the provincial states, and
council of deputies of that country. The stadholder, was
originally, a kind of dictator, appointed, from the necessity
of the time, to conduct the emancipation of the state.
When that necessity vanished, the office became of dubious
authority, till William III. in 1672, procured it to be de-
clared hereditary. As he died without children, the states
revoked this power; but in 1747, it was again made heredi-
tary in favour of William IV.

The new constitutional code, under the sovereignty of
Louis, consisted of five parts, or rather short chapters.
The civil, religious, and political institutions were con-
tinued; and the public debt guaranteed. The council of
state was composed of thirteen members. All forms of
religion were tolerated, even that of the king; to whom it
pertained to nominate to all offices and places, formerly,
then gift of the grand pensionary; for the code takes no
notice of the stadholder. The coin was to be stamped with
his effigy; and, with the advice of the privy council, he had
the prerogative of pardoning offences. The government
of the colonies was specially and exclusively vested in it,
and the general administration of the kingdom was com-
tinued to four ministers of state. The legislative body was ap-
pointed to consist of thirty-eight members, chosen for five
years, in a certain proportion for the several provinces;
those for Holland being seventeen. The title of high-
mightiness, was retained for the assembled members of the
legislative body, the late grand pensionary being de-
clared president for life. This assembly was appointed to
meet twice in the year, in April and November; but ex-
traordinary assemblies might be summoned by the king.
Justice was directed to be administered according to the local
customs and statutes of each province and city, the ordinances
of the States-general, and in defect of all these, the Roman
code. Each province has a supreme court, to which ap-
peals lie from the lower courts of justice, except in criminal
cases, in which the stadholder might pardon, by the con-
fident of the president and superior court of each province,
except in cases of murder and other flagrant crimes.

The army was formerly comprised at about 36,000, but
it has been since the revolution incorporated with that of
France. The navy, which used to consist of forty ships
of the line, has now almost totally disappeared. The revenue
was about 31 millions sterling; but the expenditure far ex-
ceeded it, so that the national debt was computed at about
130,000,000. sterling; but 2,860,000 were annually re-
cerved as the interest of loans to foreign powers. The dilu-
pitation of the revenue and the increase of the debt have been
very sensible since the establishment of a nominal monarchy.
The political importance of the United Provinces is alto-
togeher confounded with that of France, of which empire it is
becoming a part, and to which it is absolutely subject. What
changes farther await it the wise politician to conjecture.
We refer to the article United Provinces.

Holland, a town of Frussia, in the province of Ober-
land, situated near the river Weeke, and strongly fortified;
40 miles S.E. of Dantzic. N. lat. 54° 2'. E. long. 19°
37'.

Holland, New, Notes, or, as Cook called the eastern part of it, "New South Wales," is an island in that part of
the globe lately distinguished by the name of Australasia, so
large as to be entitled to the appellation of a continent. Its
length from E. to W. is about 43 degrees of longitude, in
the meridional latitude of 25°; that is, about 2,350 geographical
miles, or 2,750 British. The breadth from N. to S. extends
from 11° to 39°, being 28,160 geographical, or 16,620
British miles. In the account of Cook's voyage, its square
surface is laid to be more than equal to the whole of Eu-
rope. This, however, is an exaggerated estimate; because
Europe is supposed to be about 350,000 British miles in its
ut-
moll length, and its greatest breadth 12,000. This defect is, in-
deed, compensated by the proximity of many large islands;
and the whole of Australasia will probably be found greatly
to exceed the European continent. This immense territory
was first discovered in the beginning of the seventeenth
century, and then called "Terra Australis Incognita." The
first discovery is dated by De Broiles in October 1616, when the western part was explored by Hartog. In 1628,
the western part was discovered by some vessels belonging
to the Dutch East India company, and called "De Witt's
Land," from the name of the commodore who commanded
the squadron; and in the following year, a Dutch ship,
commanded by Capt. Pallart, was wrecked on this coast.
In 1642 Capt. Tasman was sent by the Dutch East India
company to survey the coast, which visited the southern part,
and he called it "Van Diemen's Land," by way of contradistinction to "Dienmen's Land." (See Dienmen's Land.) Capt. Dampier fell in with this
island in 1688, and visited it again in 1699. He describes the
wretched condition of the inhabitants, as defluite of houses and
clothes; he represents them as black, tall, thin, straight-
bodied with small limbs, great heads, heavy brows, and eye-
lids half closed for guarding their eyes against the flies,
which were numerous and troublesome. He further de-
scribes them as having large bottle-noises, full lips and wide
mouths, without the two fore-teeth of their upper jaws, and
without beards; long-visaged, and defluite of every grace-
ful feature in their faces. The next person who visited this
island was Capt. Cook, in 1770, who by his extensive op-
erations on its E. side, left little to be done towards com-
pleting the full circuit of it. Between Cape Hicks, in
latitude 38°, where his examination of this coast began, and
that part of Van Diemen's Land, whence Tasman took his
departure, the distance was not above 55 leagues. It was
highly probable, therefore, that they were connected; though
Capt. Cook cautiously says, that he could not determine
whether his New South Wales, (that is, the east coast of
New Holland,) joins to Van Diemen's Land, or not. But
what was thus left undetermined by the operations of his
first voyage, was, in the course of his second, soon cleared
up. Capt. Furneaux, in the Adventure, during his separa-
tion from the Resolution in 1773, having explored Van
Diemen's Land, from its southern point, along the E. coast,
far beyond Tasman's station, and on to the latitude 38°,
where Capt. Cook's examination of it in 1770 had com-
enced. We have now, therefore, a full knowledge of the
whole circumference of this vast body of land, though most
of its interior parts remain still unknown. To the south-
ward of lat. 33° or 34°, the land in general is low and level;
far northward it is hilly, but in no part can be called moun-
tainsous: and the hills, and mountains, taken together, form
but a small part of the surface, in comparison with the vallies
and plains. It is rather barren than fertile, though the rising
ground is chequered by woods and lawns, and the plains and
vallies are in many places covered with herbage: the soil,
however, is frequently sandy, and many of the lawns, or va-
nahas, are rocky and barren, especially towards the
northern part, where vegetation is less vigorous than towards
the south. The inland country appeared to be better clothed
than the sea-coast. The banks of the bays are covered
with mangroves, to the distance of a mile within the beach,
under which the soil is a rank mud, always overflowed by a
spring
spring tide; farther within the country, a bog was occasionally found, upon which the grass was very thick and luxuriant, and sometimes a valley occurs, that was clothed with underwood; but the soil in general did not seem to admit of cultivation. In the interior of the country immense tracts of coal have been discovered. The coal, especially to the northward of 25° S. lat. abounds with fine bays and harbours, where vessels may be secure from all winds. The country appeared to be well watered by springs and small brooks, but it has no large rivers. Of timber-tree there are but two sorts; the largest is the gum-tree, which grows over the whole country, the gum of which is a deep red, and resembles the fagius draconis, if it be not the same; the other grows somewhat like our pines. The wood of both is extremely hard and heavy. Others are covered with a soft bark, which is the same that is used in the East Indies for caulking of ships. The country furnishes three sorts of palms; the nuts of one of which operated both as an emetic and cathartic with great violence. The quadrupeds of this island are the dog, of the chaco kind, which never barks, the kangaroo, an animal of the oporum kind, resembling the phalanger of Buffon, and another like the pole-cat, called by the natives Quoll. Here are many kinds of bats. The sea and other waters abound with gulls, drakes, pelican, geese or gannets, boobies, noddies, curlew, ducks, pelicans of an enormous size, black swans, the menura fiphera, having its tail expanded in the form of a lyre, and many others. The land birds are crows, parrots, cockatoos, cockatoes, and others of the same kind, exquisitely beautiful, pigeons, doves, quails, budcrants, herons, cranes, hawks, and eagles. Among other reptiles, here are various kinds of serpents, some noxious and some harmless, scorpions, centipedes, and lizards. Of the insect tribe the principal are the minutio and ant, some of the latter of which are green, and form their nests in a curious manner upon the trees. The ants are of several kinds. The sea abounds with fish of various sorts: upon the shores and rock are incredible numbers of the finest green turtle in the world, and oysters of various kinds, particularly the rock oyster and the pearl oyster. Here are very large cockles, lobsters, and crabs. In the rivers and salt creeks there are alligators. The number of inhabitants in this country seems to be very small in proportion to its extent. The immense tract of the interior country remains unexplored, but there is reason to believe that it is either wholly defoliated, or more thinly inhabited than the parts visited by Cook and his companions. The preemption against its being much inhabited is strengthened by the total want of cultivation. The men were of a middle size, and in general well made, clean-fisted, and remarkably vigorous, active, and nimble; their countenances were not wholly without expression, and their voices remarkably soft and effeminate. The colour of the skin could not be well ascertained. On account of the dirt which uniformly covered it: with the dirt it was as black as that of a negro, and without it supposed to be of a chocolate colour. In other respects the accounts of our navigators materially differ from that of Dampier. They inform us that the features are not distinguishable, that their noses are not flat, and that their lips are not thick: their teeth are white and even, and their hair naturally long and black, though universally cropped short, and always matted and filthy; their beards are bushy and thick, but not suffered to grow long; both the hair and beard seemed to be kept short by forcing them. Both sexes go stark naked, without any apparent feint of indecency. Their principal ornament is the bone which they thrust through the cartilage that separates the nostrils; it is as thick as a man's finger, and being five or six inches long, reaches quite across the face, and is an impediment both to their breathing and speaking. They had also necklaces made of shells, neatly cut and stringing together: bracelets of small cord, twisted two or three times round the arm, and a string of plaited human hairs round the waist. They paint their bodies both white and red, the latter forming broad patches upon the shoulders and breast, and the former being drawn in strips over various parts of their bodies. These people had no idea of traffic; they received what was given them, but had no idea of making a return, nor did they seem to have any disposition to trade; but if they were refused what they asked for, e.g., a turtle, they were enraged, and endeavoured to take it by force. On their bodies were visible scars, inflicted by blunt instruments, and which were understood to be memorials of grief for the dead. They appeared to have no fixed habitations, nor was there any trace of a town or village in the country. Their hovels, when they had any, were mere hovels, constructed with pliable rods and covered with leaves of palm or broad pieces of bark: but in general they slept without any shelter, except the hovels, or graps, which is here near two feet high. Their fish-hooks are neatly made; and their lines, made of some vegetable substance, are from the thickness of a half-inch rope to the fineness of a hair. Their chief food is fish, and they occasionally kill a kangaroo and some birds: the only vegetable that forms an article of food is the yam. They dress their animal food by boiling or baking, or making it. As they have no nets, they catch fish only by lacking an infusion of wood adapted to the purpose, or with a hook and line. They produce fire with facility, and spread it in a wonderful manner. To produce it they take two pieces of dry wood, one being a fick about eight or nine inches long, and the other a flat piece: the former is shaped into an obtuse point at one end, and pressing it upon the other, they turn it nimbly by holding it between both their hands, as we do a chocolate mill, often shifting their hands up and down, to increase the pressure. By this method they get fire in less than two minutes; and then spread it by means of the dry graps. The weapons of this people are lances, or lances, of different kinds, pointed with bone or shells, and barbed; and they throw them with great force and dexterity; either by the hand for short distances, or with an infusion contrived for that purpose: they have also shields or targets made of the bark of a tree. Their canoes are as rudely contructed as their hovels, of bark or the trunk of a tree hollowed, probably by fire. They are moved with a pole or paddles, and some of them are fitted with an outrigger to prevent their overturning: they are of different lengths and support. The only tools which they seem to possess was an adze made of stone, wedges of the same material, a wooden wallett, and bone shells, and fragments of coral. For polishing the points of their lances, etc. they use the leaves of a kind of wild fig-tree. Each of their canoes carries four people. The eastern coast of New Holland was carefully examined by Capt. Cook, and formally taken possession of in the name of the king of Great Britain in 1770. At the close of the American war, it was determined by the British government to make a settlement on this coast for the accommodation of transported felons. (See Botany Bay.) It appears from some further discoveries and reports, pertaining to this country, that it is peopled by three or four distinct races of men; those in the S.W. being different from those in the N., and both from those in the E. above described. They are merely divided into families, the former being styled Be-ana, or father, which is a title of respect; and each family or tribe has a distinct place of residence, distinguished by adding "gal" to the name of the place; e.g., the southern shore of Bo
tany-bay being called "Gwea;" the tribe inhabiting it is
denominated "Gwea-gal." Tho' those live on the north
shores of Port Jackson are called "Cam-mer-ny-gal," Cam-
mer-rhy being the name of that part of the harbour. This
tribe, which is numerous and muscular, exercise the preroga-
tive of excitating a tooth from young men of other families, in
token of government or subordination. This tribute of teeth
is paid in a solemn manner, and it is performed every four
years. They manifest but very obtrusive traces of religion,
tho' they have some faint ideas of a future existence in the
clouds, whence they originally fell. They seem raised, but
one degree above the brute creation; and, like monkeys, they
are great misers. The deformity of their appearance, oc-
casioned by their low stature and thin limbs, their black buffy
beards, and the bone stuck in the cartilage of the nose, by
an operation performed between the ages of eight and six-
teen, is further increased by their practise of rubbing fish
oil into their skins as a protection from the air and mufi-
toes, and of colouring their faces with white or red clay.
The women are marked by the loss of the two first joints
of the little finger of the left hand, which, as well as the
extraaion of a tooth from the boys, is supposed to inure
them to bear pain with apathy. It is said, however, that
these joints of the little finger are parted with because
they are in the way when they wind their fishing lines over
the hands. Few infallities of deformed persons occur.
They eat their fish by the manner of an oven, laying the fire at the entrance, and filled
with smoke and marlme, in which they sleep promiscuously.
Their mode of courtship is not very gallant; as it conists
in watching the lady's retirement, and then knocking her down
with repeated blows of a club, or a wooden sword; after
which the matrimonial victia is led, streaming with blood,
to her future husband's party, when a scene enfues too shock-
ing to relate. The men of one tribe seek wives among the
women of another. The woman thus ravished is called a
wife; and polygamy is common. Parturition is easy, and
a few hours after the mother walks about her usual busines.
The infant is placed for a few days on a piece of soft bark;
but is soon removed to the mother's shoulders with its legs
across her neck, securing itself by catching hold of her hair.
Superiority is very prevalent among these poor savages;
they believe in magic, witchcraft, and ghosts, the latter ba-
ing the night-mare. They have also spells against thunder
and lightning, and pretend to foretell future events by the
meteors called falling stars. They are subject to a disafe
resulting from a violent itch; but for their venereal complaints
they seem to have been indebted to Europeans. They have
not only personal property in their weapons, and fishing
tackle, but some are suppossed hereditary properties of certain
spots, perhaps assigned as rewards for public services, or
acts of great bravery. They are represented, with regard
to their habitual disposition, as revengeful, jealous, coura-
geous, and cunning. If they were honer, when first visited
by Europeans, they have since acquired the art of feasting;
and they are said to be adept in the arts of evaasion and lying.
Savage, as their state is, they are incapable of friendship,
and capable of feeling sorrow. They have names for the
sun and moon, for some stars, the mag-deican clouds, and the
milky way. Young people are buried; but those who
have passed the middle age are burnt; a rude tumulus being
created at a tomb. Mr. Collins, in his account of this island,
have given an ample vocabulary of the language; which is
said to be gratefull to the ear, expressive, and sonorous, and
to have no analogy with any other known language; but
the dialects of the various regions seem to be entirely dif-
ferent. The season's are like those of the southern part of
Africa and America; and as the country lies on the southern
side of the equator, they are the reverse of those in Europe.
The climate, however, is allowed to be very fine and ful-
inuous. The rains are heavy, falling chiefly about the full
and change of the moon, and at intervals there are storms of thunder and lightning. Of the lakes, rivers, and mountains
of this extensive country, our information is hitherto very
imperfect; but they may probably be found to be on a large
scale. A chain of mountains is said to run N. and S. be-
 tween 50 and 60 miles inland, but not easily accessible, on
account of numerous deep raviad. Baffalic mountains often
appear; and in Howe's island they are said to rise to 500
feet, as to be visible at the distance of twelve leagues.

The whole of the S.W. coast of New Holland has been
explored by D'Entrecasteaux; who has made correct charts
of it, and other parts have also been investigated, so that in
due time we shall have a more complete account of this
extensive island, or group of islands, if, indeed, it conists,
as some have suggeisted, of several. S. lat. about 11° to 39°.
E. long. 113 to 156.

Holland, a township of America, in Hampshire county.
Machafuchets, bounded S. by Holland county in Connecti-
cut, E. by Worcester county, and northward by Brimfield,
incorporated in 1785; and containing 445 inhabitants; 75
miles S.W. by W. of Boston.

Holland, Cape, a cape in the straits of Magellan.
S. lat. 53° 57'. W. long. 72° 34'.

Holland's Islands, islands of America, near to the S.
of Hooper's island, in Cheapekay bay.

Holland's Point, a cape on the W. side of Cheapekay
bay, which, together with Parker's island, forms the mouth
ofriotting bay.

Holland River, a river of Upper Canada, running from
the S.W., and discharging itself into Cook's bay, lake
Simee.

Hollanderoeller Insecat, a small island in the North sea, near the W. coast of East Greenland. N.
lat. 60° 38'. W. long. 46° 25'.

Hollatt, a town of Austria, on the Danube; six
miles N.N.W. of Bruck.

Hollemoppo, a town on the N. W. coast of the
island of Timor. S. lat. 9°. E. long. 124° 56'.

Hollingbach, a town of Germany, in the princi-
ship of Hohlenlo; 17 miles N.E. of Ohringen.

Holleriuse, James, or, in his native language,
Houlier, in Biography, a French physician and
surgeon, of some eminence in the sixteenth century, was born at
Elimples, and took his doctor's degree in the faculty of
Paris, of which he was elected dean in 1546. He obtained
great reputation by the success of his practice both in
medicine and surgery, and is said to have paid particular attention
to render the mind cheerful under ills, with a view to
facilitate the cure of corporeal difficulties. He was the author
of several works, none of which he published himself. Some
were printed during his life under the superintendence of his
pupils, and some after his death, which happened in 1562.
Among his works were commentaries on the books of Galen
"De Compositione Medicamentorum," and on the
Aphorisms of Hippocrates; likewise a treatise "De
Materia Chirurgica," in three books, which went through
numerous editions, in some of which the title of "Institu-
ations Chirurgicae" was adopted; "De Morborum cura-
tions, &c." 1563; and "De Morbis internis Libri duo,"
1571, which was frequently reprinted. Elay. Dict. Hist.

Holles, Denzil, lord, second son of the first Hol-
es, earl of Clare, was born in 1597. He was liberally edu-
ated.
members, and when his father had a place at court he was for a

time companion and bed-fellow to Prince Charles, then Duke

of York. When he attained a proper age he sat in parliament as member for St. Michael’s, Cornwall, and sided with the opposition party. At the accession of Charles I. he refused the offer of a knighthood of the Bath, and in the parliament of 1627 he was, owing to the interest which he had acquired by his marriage, returned for Dorchester, and took a leading part in favour of liberty. When the three

resolutions of the commons against Popery, Arminianism, and the levying of tonnage and poundage by the king’s prerogative, were drawn up, he was one of the two who forcibly held the speaker in his chair till they were passed. For his conduct on this occasion he was prosecuted, and condemned to a fine and imprisonment in the Tower, where he remained twelve months. Irritated by this treatment, and fixed in his principles, he entered the long parliament in 1640, a determined foe to the court, and by the vigour and abilities which he manifested, he was placed at the head of the Presbyterian party. His relationship with the earl of Strafford preventing him from taking a part against that nobleman, he carried up the impeachment of archbishop Laud. He was one of five members accused by the king of high treason in 1641, and the attempt at seizing them was the immediate cause of taking up arms. In the ensuing war the parliament gave him the command of a regiment, and appointed him lieutenant of Brittol. Mr. Hollis, however, soon saw through the delusions of the independent party, and with the view of frustrating them he endeavoured to promote a treaty with the king. At length he was obliged to escape to France to avoid a prosecution for high treason from the party with whom he had acted. By the interposition of his friends he was allowed to return in 1648, when he resumed his seat in parliament, and was one of the persons appointed to treat with the king in the Isle of Wight. He was not prepared to go to all the lengths of his party, and was again obliged to quit the country to ensure the safety of his person. He took up his abode in Brittany, where he continued till the year preceding the restoration, which event he had used all his influence to promote. On the restoration he was advanced to the peerage by the style of Lord Hollis of Isfield, in the county of Suffolk. He was now employed by the court in various negotiations, but his attachment to the principles of liberty remained unabated, and when the politics of the reign tended to render the king absolute, he appeared as a leader in opposition. No man had a more disinterested love of his country than Lord Hollis, a proof of which was exhibited, when offered by parliament 5,000l. as a reparation for the losses which he had sustained in the civil war: “I will not,” says he, “receive a penny till the public debts are paid.” He died in 1679, in the 82d year of his age. He was buried in Dorchester church, where a monument was raised by his great nephew John Duke of Newcastle. Biog. Brit. Hume.

Hollis, in Geography, the Njstetter of the Indians, a township of America, in Hillsborough county, New Hampshire, on the Maschicnet’s line, incorporated in 1746; about 70 miles S.W. of Portsmouth, and containing 1557 inhabitants.

Hollis, in Geography, the Njstetter of the Indians, a township of America, in Hillsborough county, New Hampshire, on the Maschicnet’s line, incorporated in 1746; about 70 miles S.W. of Portsmouth, and containing 1557 inhabitants.

HOLLE, a town of Bavaria, in the bishopric of Bamberg, in the Wient; 15 miles E. of Bamberg.

HOLLI, the Indian name for what the Spaniards call spilis; a refinis liquor, which flows spontaneously from the tree holylauihuytli, or chilii. It is often mixed with chocolate in the making, in the proportion of one fourth part; it gives the chocolate in this case no very disagreeable flavour; and becomes a very powerful medicine in dyenteries. It is usual, however, before the making it, to mix the cacao and hollis on an iron plate, and torify them thoroughly together.

Hollis, Thomas, in Biography, was born at London in April, 1720. Being designed for commercial life, he was sent, when about 14 years of age, to Amsterdam, for the purpose of learning the French and Dutch languages, and merchants’ accounts. Soon after his return, in 1735, his father died, and as he was now heir to a large estate, it was resolved to complete his education on a liberal plan. With this view he was placed under the care of Dr. Ward, professor of rhetoric at Gresham college, with whom he studied the learned languages, and other branches of literature. In 1740 he took chambers in Lincoln’s Inn as a law student, and probably with some view of following the profession, but though he lived there eighteen years, it does not appear that he applied himself, professedly, to the study of the law. He did not, however, waste his time in idle amusements and dissipation; he had already formed an acquaintance with persons eminent for their attachment to liberty; and had imbied their principles, which strongly marked his character through life. Even when a boy at school, he was interested in the noble deeds of the heroes of antiquity, “I used,” said he, “to rob nature of her self to read Plutarch, honing Plutarch, and read again the lives of his heroes. To him, I owe, I willingly confide, the finest digpositions of my mind.” In 1748 he set out on a tour upon the continent, and the journal which he kept while he was absent proves that he suffered nothing worthy of observation to escape his notice. In 1750 he made a second tour, and finding on his return that he could not gratify his wish of serving his country, by entering into parliament, without compliances which were contrary to his principles, he began to make a collection of books and medals for the purpose of preferring the memory of the champions of liberty; and, in general, for the service of science and art. It was also one of his leading objects to print, and present to his friends, books favourable to the popular principles of government. Milton and Algernon Sidney were the authors that attracted his principal admiration. He investigated with great minuteness the history of Milton and his works, and caused engravings to be made of his portrait taken at different periods. The particulars of Mr. Hollis’s life are little more than a lif of generous and public spirited actions, either for the relief and encouragement of individuals, or for the promotion of what he considered the most important interests of mankind. There were few useful and benevolent institutions of which he was not a member, and a liberal patron. The books which he published, or procured to be published, were “Wallis’s Grammar of the English Language,” “Locke on Toleration and Government;” “Sydney on Government;” “Needham’s Exellency of a Free State;” “Neville’s Plato Redivivus;” and “Staveley’s Roman Horleach.” He was of course aed by several pamphlets from America to be reprinted at his own expense. He encouraged the printing of other works favourable to liberty, by taking large numbers of copies and distributing them as presents. His munificence in this respect contributed very much to extend the knowledge of English literature and English generosity through foreign countries. In 1770 he retired into the country, where he employed himself in improving his estate at Corfecombe in Dorsetshire. He kept many workmen constantly employed in his service, to some of whom he was giving directions on New Year’s day 1774, when he dropped down in a fit and immediately expired. Mr. Hollis, says one of his biographers, was an athletic make, inclined to corpulence, which he counteracted by great abstemiousness of diet, and strong exercise. He allowed
allowed himself scarcely any of the indulgencies of a man of fortune, and opposed the growing luxury of the age, as well by his example as by his precepts. His particular sentiments with regard to religion were known to himself only. He joined no sect, and attended no place of worship, but his diary contains a multitude of proofs of his veneration and gratitude to the Supreme Being. He was, in every respect, an universal philanthropist, and it was said of him, 'that in his death Liberty lost her champion, Humanity her treasurer, and Charity her reward.' Hollis Memoirs, 2 vols. 4to, 1780.

Holliston, in Geography, a township of America, the most southerly in Middlesex county, Massachusetts; 28 miles s. by w. of Boston; incorporated in 1734, and named in honour of Thomas Hollis, Esq., of London, and now containing 731 inhabitants.

Hollinman, Samuel Christian, in Biography, was born at Stettin in 1696, where he received the elementary principles of a learned education. His masterly studies he purified at Wittenburg, took his degree of M.A. in 1720, and for a short time he read lectures at Greifswald and Jena. In 1734 he was invited to be public professor of philosophy in the university of Gottingen, then lately founded, and upon the establishment of the society of the sciences he was the first regular member of the philosophical chiefs. Here he continued his lectures till the year 1734, when he resigned the duties of his office. He died in 1757. The university of Gottingen was under vast obligations to this learned man, who with Haller contributed to diffuse through Germany a taste for natural philosophy and natural history. On these subjects he published several excellent papers in the transactions of the royal societies of Gottingen and London. He likewise distinguished himself by various elementary works and dissertations, which are enumerated in the General Biography, to which the reader is referred.

Holloa, in Sea Language, is an exclamation of answer to any person who calls to another to ask some question, or to give a particular order. It is also the first answer in hailing a ship at a distance.

Hollola, in Geography, a town of Sweden, in the province of Tavastland; 70 miles E. of Tavasthus.

Hollow, in Architecture, a concave moulding, about a quadrant of a circle, by some called a cefament, by others an abacus.

Hollow-quoin, in Engineer, are piers of stone or large bricks made on purpose behind each lock-gate of a canal, which are formed into a hollow from top to bottom to receive the rounded head of the lock-gates: in some instances the hollow-quoin is formed of one piece of oak cut to the proper shape and fixed vertically against the wall, and even cut iron has been used, on some recent occasions, for forming the hollow-quoin or hinge for the lock-gates of large canals, or the entrance bafons to docks. See our article Canal.

Hollow Roots, in Botany and Gardening. See Fernaria.

Hollow Square, in Military Language, is a body of foot, drawn up with an empty space in the middle, for the colours, drums, and baggage; facing and covered by the pikes every way, to oppose the horse.

Hollow Tower, in Fortification, is a rounding made of the remainder of two buildings to join the curtain to the orllon, where the small shot are played, that they may not be so much exposed to the view of the enemy.

Hollow-toothed Horse, in the Monge. See Shell-toothed.

Hollows, in Mining, denote the wadles, goblins, or old hollows in coal-pits, from whence the coals have been wrought or gotten. The old hollows in many coal works generate Dings (see that article), or foul air, which is very prejudicial to the works: and, in some instances, the waste coals in them are fired by the pyrites, duns, and other self-infaming substances among them, if the air be not excluded from these hollows; as at Doulltherpe colliery, in Derbyshire, and others near Dudley, in Staffordshire. See Fary's Derbyshire Report, vol. 1.

Hollowness of Trees. This is one of the most mischievous indications to which trees are subject. It is generally occasioned by the lopping of them in an improper manner, and leaving the wet to fall in upon them, especially on their heads. When this mischief is found out in its beginning, the only method is to cut the trunk off to the quick, sacrificing the whole hollow part; it is, in this cafe, to be cut off sloping, that the wet may run off from it. All soft woods are liable to this mischief, after the lopping, particularly the elm; and when it takes hold of any tree, it grows upon it daily, till the whole substance of the tree is at length eaten away, and only a coat of bark is left. The best way of preventing it in the elm, is never to cut off the head or top of the tree at all, but only to lop the fide branches; these will yield a very large quantity, and the body of the tree will thrive the better for their being often cut off, and will be good timber at last. These tall elms sometimes grow hollow from another cause, that is, from the decay of some of the large roots; but the favorable condition of its branches will check this, though there be no external mark of it. This sort of hollowness always begins at the bottom of the tree. Blasted parts of the trees are to be cut away to the quick, in the same manner as the hollow ones, and the wounds will heal in the same manner.

Holls, in Geography, a lake of Norway, in the diocefe of Aggerhus; 70 miles N. of Christiania.

Holly, in Botany and Gardening. See Ilex.

The common holly is often found useful as a hedge plant. It is a plant which on good, dry, loamy soils, grows to a considerable size; but which on poor wet soils seldom becomes more than a low shrub. It has been recommended as making an impenetrable fence, and as bearing to be cropped with but little injury; and that sheep are capable of being fed in the winter with the cropplings; while birds consume the berries. The bark, when fermented, and then washed from the woody fibres, constitutes the common bird-line. And the beauty of its scarlet berries are affected never to suffer from the severity of our winters. The wood is found excellent for veneering; being occasionally stained black in imitation of ebony. (See Marquetry.) It is useful for the handles of knives, as well as the coggs of mill-wheels. Provicially it is not unfrequently denominated Hollin.

A late writer contends, that "no plant makes so good a hedge as holly; if preferred with any attention in its infancy, it will, in a few years, be impenetrable to man or beast. It often fails from being planted at an improper season; for there is not the least certainty of any success, except by planting about Midsummer. The plants should be from six to nine inches high, and well rooted: they should not be let into the sloping face of a bank, but on a level table-land; to that purpose, and well defended on both sides, to keep both sheep and hogs from it. This is one of those plants that may likewise be intermixed with the white thorn in the constituting of hedge fences, and which by its mixture renders them still more beautiful. See Fence and Hedge.

Holly,
HOLKIRK, a town of the island of Pomona; nine miles S.E. of Kirkwall.

HOLME. See HOLM.

HOLMES, Flot and Step, in Geography, two small islands situated in the British channel, between Glamorgan-shire and Somersetshire. The former contains about 60 acres of land, and is distinguished for its light-houses. Several pilots reside on it. The Steep Holmes is a small rocky island, the highest point of which rises 330 feet above the level of the sea. It is almost depauperate of vegetation; but is the resort of large flocks of sea-fowls during the summer season. This solitary and inhospitable spot is said to have been a place of refuge to the ancient British historian, Gildas, who hoped thus to preserve his life from the marauding Picts and Scots. He afterwards retired to Glandourby.

HOLMES’S HOLE, a commodious and safe American harbour, in Duke’s county, Massachusetts, on the N. side of Martha’s Vineyard; 98 miles S.E. of Boston.

HOLMESTRAND, a town of Norway, in the province of Aggerhus; 30 miles S. of Christiania. N. lat. 59° 30’. E. long. 10° 30’.

HOLMON, a small island on the W. side of the gulf of Bothnia. N. lat. 63° 48’. E. long 20° 37’.

HOLMSKUOLDIA, in Botany, was named by professor Rumphius of Leyden, in honour of a Danish nobleman, Theodore Holm, afterwards Holmshelf, who wrote a treatise in Danish on Angiologia, in 1761, and a splendid folio in Latin and Danish on Fungi, explaining the structure of the Clavariace and some of their allies, published at Copenhagen in 1792. He was born in 1732 and died in 1794, according to Dryander’s Bibl. Banks, v. 5. 287.—Retz. Obf. fac. 6. 31. Willd. Sp. Pl. v. 3. 360. (Hallingia; Sm. Exot. Bot. v. 2. 41. Intr. to Bot. 403. See HASTINGA.)—Claws and order, Didynamia Gymnospermia. Nat. Ord. Periclitata. Linn. Lobatea, Jull.

Gen. Ch. Cal. Perianth inferior, of one leaf, very large, coloured, turbinate, gradually expanding into a wide bell-shaped limb, with five shallow, equal, unarmed lobes. Cor. of one petal, ringent, tubular; tube longer than the calyx, swelling upwards; upper lip short, ascending, eleven, obtuse; lower in three rounded lobes; the middle one largest, entire. Stam. Filaments four, thread-shaped, rather longer than the upper lip, two of them shorter than the rest; anthers incumbent, roundish, simple. Pist. German superior, four-cleft; style the size of the stamens and situated between them, its summit bent downward; stigma in two sharp lobes. Peric. none, except the faded, scarious, permanent calyx. Seeds four, naked, in the bottom of the calyx, somewhat obovate, ruged.

Eff. Ch. Calyx bell-shaped, dilated, much wider than the corolla, coloured, in five shallow, equal, unarmed lobes.

1. H. funguiana. Retz. and Werd. as above. (Hallingia coccinens; Sm. Exot. Bot. v. 2. 41. t. 80.)—Gathered by Koenig and by lieutenant-colonel Thomas Hardwicke, in valleys among the mountains of the north part of Bengal, flowering in February or March, and ripening feed in April. It is called by the people of the country Glurkilubara, a name almost as difficult of pronunciation as Holmshelfia, which we are told is spoken as if it were written Holmshubla, to the no small comfort of those who, like us, are forced to adopt it, in justice to its meritorious prototype, and those who have delighted to honour him. The original application of this new and curious genus, given by Koenig, Hallingia, was retained in the Exotic Botany, because the writer of that work could have no suspicion of any one’s having committed to great an error as to place this plant in the order

45
Angiof ruin, its characters and affinity being so manifestly near Phobus and Moluccella in the Gymnospermia. It was, therefore, concluded to be unpublished.

The only known species of this genus is a very handsome shrub, whose stem is smooth, roundish, with many opposite branches. Leaves opposite, on furrowed stalks, without stipules, ovate, pointed, veiny, two or three inches long, slightly serrated, almost perfectly smooth, dotted on both sides, paler beneath. Flowers in terminal, loose, bracteate bunches, of a vivid scarlet. Flower-field downy. Calyx an inch wide, veiny, slightly downy, as richly coloured as the corolla, which is also pubescent, longer than the calyx, but much narrower, as in Moluccella. Seeds black. This plant would be a great ornament to our lawns, and might probably succeed in a conservatory with less heat than tropical vegetables generally require.

What the worthy Retzius saw when he examined "a half-ripe capsule" of this shrub, in which he "manifestly observed several feeds, but could not absolutely judge whether it were unicapular (meaning unilocular) or not," we are utterly unable to imagine.

HOLO, in Geography, a town of Sweden, in Sudderland; 24 miles S.W. of Stockholm.

HOLOCAUST, a place near, formed from ὴλος, whole, and καστός, and xxin., I consume with fire, a kind of sacrifice, wherein the whole offering is burnt or consumed by fire; as an acknowledgment that God, the Creator, Pecifex, and Lord of all, was worthy of all honour and worship, and as a token of men's giving themselves entirely up to him. It is called also, in scripture, a burnt-offering.

Sacrifices of this sort are often mentioned by the Hebrews as well as Jews; particularly by Xenophen, Cypreop., lib. viii. p. 494. ed. Hutchinson. 1738, who speaks of sacrificing holocausas of oxen to Jupiter, and of horses to the fun; and they appear to have been in use long before the institution of the other Jewish sacrifices by the law of Moses. Accordingly, we find this kind of sacrifice was offered by Noah and Abraham, and also by Job, and Jethro, the father-in-law of Moses. See Job, i. 5. chap. xiii. 8. Gen. xxii. 13. chap. vii. 20. On this account, the Jews, who would not allow the Gentiles to offer on their altar any other sacrifices peculiarly enjoined by the law of Moses, admitted them by the Jewish priests to offer holocausas, because these were a sort of sacrifices prior to the law, and common to all nations. During their subjection to the Romans, it was no uncommon thing for those Gentiles to offer sacrifices to the God of Israel at Jerusalem. Vide Philo.Opera. p. 801. E. Ed. Colon. Allobbr. 1613. Tertull. Apol. 26. p. 26 ed. Rigalt. 1675.

Holocausas were deemed by the Jews the most excellent of all their sacrifices. It is said, that this kind of sacrifice was in common use among the heathens, till Prometheus introduced the custom of burning only a part, and reserving the remainder for his own ufe.

HOLOGNE-AUX-PIERRES, in Geography, a town of France, in the department of the Ouche, and chief place of a canton, in the district of Liege. The place contains 678, and the canton 17,815 inhabitants, on a territory of 147½ kilometres, and 40 communes.

HOLOGRAPHUM, composed of ὴλος, all, and γράφω, I write, in the Civil Laws, something written wholly in the hand-writing of the person who signs it.

The word is chiefly used in speaking of a testament, written wholly in the testator's own hand. See Testament.

The Romans did not approve of holographic testaments; and, though Valentinian authorized them by a novel, they are not used where the civil law is in full force.

HOLOKLB, in Geography, a small island on the W. side of the gulf of Bothnia. N. lat. 60° 51'. E. long. 17° 7'.

HOLOMETER, composed of ὴλος, all, and μέτρον, I measure, a mathematical instrument serving universally for the taking of all sorts of measures, both on the earth and in the heavens.

The holometer is the same with what is otherwise denominated pantometer; which see.

HOLOMIN, in Geography, a small island of Scotland, near the W. coast of the land of Malt.

HOLOSERICA VESTITA, a garment entirely of silk, as the name imports, which was not used at Rome till the time of Heliogabalus.

HOLOSIE, in Geography, a town of Austrian Poland, in Gallicia; 40 miles W. N. W. of Lemberg.

The only species indicated by the author is the Ast. holosic., Rheede Hor. Malav. v. 9. 9. t. 7, found in the East Indies. This is a twining smooth shrub. The leaves are opposite (erroneously drawn alternate in the figure), stalked, crossing each other in pairs, heart-shaped, three or four inches long, entire, soft, smooth, milky, but not acrid. Flowers inodorous, in fcelle auxiliary umbel, large and handsome, variegated with green and white, fleck'd with purlple red. Follicles three or four inches long, half-ovate, pointed, filled with innumerable imbricated seeds.

Eff. Ch. Calyx deciduous. Corolla of five unequally jagged petals. Capsule nearly cylindrical, bursting at the top.

Off. The petals of Holofeium are described by authors in general as bipartite, or deeply cleft, and sometimes trifid; but Dr. Smith has suggested (in his Prodomus Flora Græcæ, v. 1. 351.), that the petals erou, if confant to this genus, as he suspects they are, may afford an excellent eftential mark. Schreber has observed, that in Holofeium umbellatum the petals are doubly or tripily toothed, and in

sum
Flowers are described as subtriangular. In coriandrum we find them sometimes slightly emarginate, sometimes entire, in the same flower. In Swartz's chandrum they are said to be deeply divided.

2. *H. diandrum*. Willd. n. 2. Swartz. Prod. 27. t. 7.—Stems procumbent, rather rigid. Leaves roundish. Flowers diandrous. An inhabitant of Jamaica.—Radiates capillary, whitish. Stem much branched, straight, smooth. Leaves opposite, entire. *Stipulas* hairy, at the base of the flower-flanks. *Capitule* roundish, or slightly triangular. Profetor Swartz remarks that this is distinct from the last species, being altogether a much smaller plant; but upon comparing his plate with the Linnean specimen of *H. coriandrum*, it appears that the latter is extremely variable in size, and therefore this circumstance is not sufficient to make them distinct species. Neither are the diandrous flowers a proper distinctive mark, because *H. umbellatum* frequently varies in having from three to ten flanks. We, therefore, only adopt this species on the authority of Swartz. The petals of *H. coriandrum* are often as deeply divided as those of *diandrum* are represented.

4. *H. biflorum*. Linn. Sp. Pl. 130. Amen. Acad. v. 3. 21.—"Leaves orbicular, hairy."—A native of Malabar.—There are no specimens either of this or the last species in the Linnean Herbarium, nor are they any where figured.

5. *H. umbellatum*. Linn. Sp. Pl. 130. Engl. Bot. t. 27.—"Flowers in umbels."—This is rather a scarce plant, found on old walls, flowering early in the spring.—It was first detected in England by Mr. Pitchford in the year 1765, on walls in the neighbourhood of Norwich.—The plant is in general smooth, somewhat glaucous. Stem branching at the base, towards the top hairy and villous. Leaves opposite, ovate, acute. *Umbels* simple, terminal. Peduncles bracteated, divergent when the fruit is ripe. *Flowers* white or bluish-coloured. *Capitule* six-toothed. *Stamens* varying from three to ten in number.

This is the only British species of Holothurium. It approaches very closely in habit to *Cereaffium*, and was placed in that genus by Mr. Hudson; but its petals being unequally jagged, and not bival, warrant its continuance in *Holothurium*.

**Holothurium**, in *Zoology*, a Linnaean genus of the Molucca tribe of worms, the body of which is detached, cylindrical, thick, naked, open at the extremity, and the mouth surrounded by flexile tentacles or feelers.

This character affirms in the same family a number of animals so different in form, that it appears scarcely possible to admit the genus without some further modification. It is true that all the species referred to it by Linnaeus and Gmelin are not described with equal accuracy by their respective observers, and this consideration should induce us to speak with caution as to the propriety of reducing some particular kinds to the new genera proposed by subsequent authorities. This is not, however, the case with all; many have been examined in their native element, and in a living state with unquestionable care, and their organization explained in a satisfactory manner; upon these, therefore, we are enabled to pronounce an opinion, and confining our attention to these only we cannot hesitate to believe that the Linnean holothuriae are divisible in a natural arrangement into three, if not a greater number, of distinct genera.

The last edition of the *Sytema Naturae* contains altogether twenty-three proposed species of the holothuria, but it is to be observed that Gmelin himself affixes some mark of doubt as to the identity of the true genus to which certain kinds belong; and this not without reason, since it is clear that the specific character cannot be reconciled with the natural character of the holothuria tribe in general.

Perhaps Linnaeus, in the establishment of his genus holothuria, rejected the ideas of Forlkal without sufficient consideration. Forlkal, we find from the result of his own observations on the vermes found in the Arabian seas, conceived he had discovered, among others, two natural families of these marine bodies, and proposed for their reception the institution of two new genera, to which he applied the significant appellatives of priapus and sibillaria; these Linnaeus confounded to his genus holothuria, and in consequence most probably of his example those genera have never been adopted.

Again, the thalas or thalas genus, suggested by Brown, is confounded by Linnaeus with the holothuria. It is probable we may not at present clearly understand the thalas tribe as to be enabled to form a very positive conclusion as to its essential characters, though we may, nevertheless, observe, that it does not seem to appertain to the holothuria tribe, being more closely allied to that of alpfa. The observations of Bofe are calculated to prove the animals of the thalas kind to be truly alpfa, and which, if accurate, must occasion the removal of some Gmelinian species of the holothuria to that genus, as the thalas, caudata, and denudata. Lamareck, however, conceives them equally distinct from the holothuriae and the alpfa, and for this reason re-establish the thalas genus as originally proposed by Brown.

As to the propriety of adopting the genus phyfalidiae there cannot, we imagine, be any difference of opinion; it is evidently distinct from the holothuria.

And, lastly, we should mention the genus velella, one of those newly instituted by the French naturalists, and which tends to unite the holothuriae with the meduze by forming an intermediate link between them, and fill connecting both. The genus contains two species, namely, the Velella mutica referred by the Linnean classification to the meduze tribe under the specific name of velella, and the holothuria tentaculata of Forlkal.

Having pointed out the number of new genera into which the Linnean holothuriae are divided by later naturalists, it will be proper to state in what material particulars their essential characters differ from each.

The true holothuriae have the body detached, cylindrical, thick, very contraflas, with a coriaceous skin, and having at the extremity a mouth armed with five calcareous teeth, and a radiation of ramose or pinnate tentacula. The genus thalas has the body detached, gelatinous, oval, or oblong, compressed at the sides, and the back either delitiute of the crest, or furnished only with a very short one, and placed near one extremity; no tentacula under the belly. In the phyfalidiae or phyflas, the body is detached, membranaceous, or gelatinous, oval, compressed at the sides, the back furnished with a crest, and the under part of the belly with a great number of diversely formed articulated tentacula of different lengths, apparently suckers. The body of the velella is detached, elliptic, cartilaginous within, the exterior part gelatinous, and having upon the back an elevated
Species

ELEGANS. With twenty branched tentacula; body papillose, reddish above, beneath white. Mill. Stroom. Soudin. &c.

Inhabits the seas of Denmark and Norway; the length from eight to eleven inches; body varied with red and white; papillose pointed, and distant, those on the back disposed in fix series; tentacula feathery, and white; the tip furnished with a tuft of fibres which are tuberculated within. Squirts out water like a siphon from the lower orifice.

P. Fonnosa. Tentacula frome; body smooth. O. Fabr.

The body ovate; beneath flat, with ten retractile tentacula; the posterior part conic, perforated at the end. Found in the northern seas.

Native of the Norwegian and Mediterranean seas. The body is ovate, beneath flat; behind conic, with the tip perforated, tentacula 10, and retractile.

Found in the Mediterranean and Adriatic seas. Length one foot; the body cylindrical when extended, and oblong when contracted, generally a beautiful mixture of red and white, but it varies in colour; the cylindrical tubes beneath the body act as suckers, by means of which it adheres to the rocks.

Inhabits the Atlantic seas, where it is often seen floating in calm weather on the surface of the water, and is known to mariners by the name of the Portuguese man of war: the form ovate, somewhat triangular, and hyaline; back acute and dusky green; anterior part reddish; snout spiral and reddish; tentacula numerous, unequal, fome round, thick and short; some capillary, with a globular yellow tip, others longer and filiform.

Native of the American and West India seas.

Inhabits the American seas.

The body of this species is oblong, rounded, and gradually tapering to both extremities; the length from three to four inches, diameter one inch; transparent, and hollow; the anterior opening triangular, the other rounded. Native of the American seas.

Length six inches; the body greenish-brown; tentacula elegantly ramified, of a yellow and silver colour; the filaments with small retractile filaments sluing from them. Inhabits the seas of Europe.

Papillosa. With ten frondose tentacula; body ovate, and covered every where with papilize. Mill. Inhabits the bays of the North seas.

Priapus. Mouth with feathery papilize; body with annular friz, and longitudinal ones on the gund. O. Fabr. Priapus, Linn.

Inhabits the Indian and Mediterranean seas; the length six inches. One half of the body cylindrical, with numerous annular friz, and terminated by the mouth; the other half obtrude and gland-flanged, with twenty-four longitudinal parallel elevented, distant, rough friz; the aperture concave, and surrounded by an excavated annular friz, and furnished within with numerous recurved spines.

Penicillus. With eight branched tentacula; body bony, and five-fide. Mill.

Lives in the mud in the deeps of the Northern seas; the body is immovable, ventricose, smooth, white, with a brown collar black at the edges, and a parallel granulated pale ring behind the tentacula, which are carinated and blackish-yellow.

Fusus. With ten tentacula; body fuffiform and downy. Mill.

Like the laft, inhabits the mud in the deeps of the Northern seas. The body is cinerose, rough with minute scales, and beset with very short fibres; protruding a cup-shaped hollow body, furnished beneath with a neck, and dilated above into an orb, perforated in the middle, with a black foramen; tentacula dentriculate at the fides.

Native of the North and Red seas; the body long, narrow, pellucid, and covered with innumerable vifcid papiliz, by means of which it sticks to whatever it touches; tentacula feathery, lanceolate, and denticulate, or slightly branched each fide.

Levis. Elongated, with white tentacula; body with five rows of lines and dots. O. Fabr.

Inhabits the Greenland seas, refiding among rocks, and frequently hiding itself in the clay, from whence each alternate tentacula is protruded, while the rel are contracted; the body is soft, smooth, whitifh and pellucid; the length from one to fix inches; tentacula whitifh, soft, and eight-clief at the tip.

Minuta.
MINUTA. Oblong, with twelve tentacula; body with five rows of warts. O. Fabr.

Found in the same seas at the latter, in sandy bottoms, and moves very slowly by means of its extended papilla. The body four lines in length, glabrous, sub-membraneous, whitish, and rarely red; each row of papilla consisting of ten; tentacula yellowish and fixed at the tip.

FORCIPATA. Ventricose, both ends narrow and conic; the anterior one foreshortened. O. Fabr.

Length five inches; the body soft, lubricious, with a thin skin covered with innumerable finely raised dots; forcepts rigid, ochrey yellow, with curved fangs. Inhabits the bottom of the Greenland seas, and is often devoured by the sea efcopion. Coccus scorpius.

ZONARIA. Oblong, depressed, with a flesh-coloured sheath, and a whitish hyaline pouch; body encircled with five yellow zones. Pallas.

Mouth transverse, with prominent gaping lips; inhabits the seas about Antiqua.

VITIATA. Body soft, lax, with white bands dotted with brown; tentacula linear-lanceolate, and toothed at the sides. Forlk.

The body with five white stripes dotted with black, and alternate narrow brown ones dotted with white; tentacula twelve, brown in the middle, and at the sides paler. Inhabit the Red sea, among zooloques, and adheres to the hands by means of its viscid papilla; length a span and a half.

MAXIMA. Body rigid and nearly square; above convex, beneath flat, and edged with white; tentacula filiform, and cut like petals at the tip. *Fidularia maxima*, Forlk.

The body about a foot in length, hard, and rough with papilla; tentacula grey hyaline. Native of the Red sea.

IMPATIENS. Body rigid and cincereos; tentacula twenty, filiform, seven-cleft, and denticulated at the tip. *Fidularia impatien*, Forlk.

Inhabits the shores of the Red sea under stones, or in the pores of Spongia officialis. The body hardish, cincereos, varied with spots and bands, and rough with hemispherical warts, whitish in the middle, and contiguous; tentacula hyaline dotted with black, and obtusely toothed.

NUDA. Orbicular, blue, without crest; tentacula of the disk naked; the rays befeft with three rows of glands. Gmel. *Holothuria demudata*, Forlk.

About an inch in diameter; the body whitish in the disk above, and radiated with concentric frits, the margin and border blue; tentacula filiform and blueish hyaline. Clofely allied to the medusa.

SPIRANS. Oval, blue, with oblique divided crest or veil, and numerous tentacula beneath. Gmel. *Forlk.*

Native of the Mediterranean; the body thin, convex, and terminating in a whitish central protuberance above, blue with brown border; crest two-parted and flattened; tentacula filiform. Length two inches.

TENTACULATA. Oval; tentacula surrounding the mouth white. Forlk, &c. An amphibious species.

HOLOWNE, in Geography, a town of Poland, in the diocese of Chelm; 28 miles N.E. of Chelm.

HOLQUAHVILT, in Botany, a name by which some authors have called the tree which produces the Jefuit's bark.

HOLRAS, in Geography, a town of Norway, in the diocese of Christiania land; 12 miles S.W. of Christiansland.

HOLRU, a town of Abyduia; 65 miles S. of Mine.

HOLSNANOF, a small island in the N. sea, near the coast of Norway. N. lat. 60° 32'.

HOLMUSNODEN, or HOLMUNDEN, a town of the principality of Wolfenbuttel, on the Wezer; 21 miles W. of Elmbeek.

HOLSM. A ship is said to be holmset at sea, when she will hull, try, and ride well, without rolling or labouring.

HOLSTABROCK, in Geography, a town of Denmark, in North Jutland, situated on a river, which runs into the North sea. The trade of the inhabitants chiefly consists in corn, oxen, and horses; 24 miles W. of Viborg. N. lat. 56° 22'. E. long. 9° 38'.

HOLSTEIN, Duchy of, a country of Germany, in the circle of Lower Saxony. The lordship of Finnemerg is bounded on the N. by the duchy of Slefwic and the Baltic, on the E. by the Baltic, on the S. by the duchy of Lauenberg, the territories of Lubeck and Hamburg, and the Elbe; and on the W. by the Elbe and the German sea. It is about 70 miles long from E. to W., and 48 broad from N. to S. Subject to frequent storms and consequent inundations from its situation between the Baltic and the German sea, its inhabitants are put to great expense in raising dykes, particularly in the districts bordering on the German sea and the Elbe. These districts consist of excellent marsh land, which produce wheat, barley, oats, beans, peas, and rape-feed in great plenty. The meadows and patures feed great numbers of cattle. The other parts of the country are still more fertile.

HOLSTEIN is divided into four provinces, viz. Holstein Proper, Stormarn, Ditmarren, and Wagria; the three first of which were formerly called "Nordalbingia," or "Saxony beyond the Elbe." The Saxons of this country were a free people, till Charlemagne subdued them, and removed them to Brabant, Flanders, and Holland. By a treaty between this sovereign and the king of Denmark, the river Elider was fixed as a common boundary of the two countries. The country on the S. of the river was called the Marche, and a marquess was appointed to defend it. Holstein Proper and Stormarn were erected into a county by Lothario, duke of Saxony, in 1106, in favour of the count of Schauenburg, and his son Adolphus II. incorporated Wagria with Holstein, and peopled the territory with frangers from Holland and Weilpalia. The territories were afterwards divided into separate principalities; and one of the princes who reigned here obtained from the king of Denmark the investiture of Slefwic. When this branch became extinct, and the people elected Christian I. king of Denmark, he became duke of Slefwic, and count of Holstein, which was soon afterwards erected into a duchy. His posterity reigned here as well as in Denmark. In 1720 the reigning prince of Holstein Gottorp, founded by the second son of Frederik I., was entirely dispossessed of his dominions. This prince had espoused Ann, the eldest daughter of Peter I. emperor of Russia. In 1743 his son, Charles Ulric, was, by his mother's will, Elizabeth, empress of Russia, declared grand duke of Russia. The king of Denmark, as duke of Holstein Gluckstadt, had formerly a seat and voice in the diet of the empire in the college of princes; and the emperor or empress of Russia posseseds the same prerogatives for Holstein Gottorp. To the king of Denmark it belonged to appoint a governor over his part of Holstein, whose usual residence was Gluckstadt, whilft the regency court for Russian Holstein was held at Kiel. The principal trading towns are Altona, Gluckstadt, and Kiel. The exports of Holstein are wheat, barley, malt, flax, buck-wheat, peas, beans, rape-seed, horned cattle, sheep, rams, swine, horses, poultry, butter, cheese, woolen, and silk. Lord Malm.worth observes, that Holstein very much resemb...
refembles England; and another traveller has remarked, that the inhabitants are in their persons very like the English. Hence it has been inferred, that the English nation came first from this lower circle of Saxony; and in confirmation of this conjecture, it is alleged, that there is an ancient town near it, called Langdon, and an island called Angles, which gave occasion to call our Britannia, Anglia. This remark is confirmed by the most diligent inquirers into this subject, who place the country of our Saxon ancestors in the Cic- 

HOLSTON, a river of America, being a branch of the Tenesse, which rises in Virginia, and joins the Tenesse, 22 miles below Knoxville. At that town it is 300 yards wide, and in a course of about 200 miles in length it receives several considerablerivers and smaller streams. It is navigable for boats of 25 tons upwards of 100 miles, to the mouth of the N. Fork, where iron-works have been erected upon a large scale. —

Also, a settlement on this river, in the state of Tenesse, containing, in 1790, 28,649 inhabitants. The land is generally fertile, and being situated between two mountains, it seldom suffers for want of rain. It abounds with iron ore. A capital furnace and forge have lately been erected in Holston, near the Virginia line, a bloomery below the mouth of Watagga, and another 25 miles above the mouth of the French Broad. There are several lead mines in the settlement, and one particularly on the French Broad, that produces 75 per cent, pure lead. Morle.

HOLSTENIUS, or Holstein, Luke, in Biography, was born at Hamburg in 1596. Having received a liberal education in his own country he went to Paris, where he acquired a high reputation for learning, but was converted from the principles of Lutheranism, in which he had been brought up, to those of Popery. He went from Paris to Rome, where he obtained the patronage of cardinal Francis Barberini, and through his means received distinguished marks of favour from the popes Urban VII., Innocent X., and Alexander VII. By the first he was made canon of St. Peter's; by the second librarian of the Vatican; and by Alexander VII. he was sent to Inpruck, where he received from queen Christiana of Sweden her formal profession of the Christian faith. He died at Rome in the year 1661, leaving behind him a high character for deep learning, a profound and penetrating judgment, and a fine critical taste. He was editor of a number of very learned works which he illustrated with notes and dissertations; and he left behind him much valuable matter, which was given to the public after his death, by his friends, in their editions of authors, or in different collections. Among his other pieces was "The Life of Pythagoras, by Porphyry," in Greek and Latin, with a curious dissertation on the life and writings of Porphyry, and observations on the life of Pythagoras. Morer.

HOLSTER, a cafe for a horseman's pitol.

HOLSWORTHY, in Geography. See Holsworthy.

HOLT, when it occurs at the beginning or end of a word, signifies that it is, or hath been woody, from the Saxon hol, a wood, or sometimes possibly from the Saxon ho, hollow. Johnson.

Holt. Sir John, an eminent lawyer and judge, son of sir John Holt, serjeant at law, was born at Thame, in Oxfordshire, in 1642. He received the first principles of learning at Abingdon, of which town his father was at that time recorder: he afterwards went to Oxhill college, Oxford, and from thence was entered a student at Gray's Inn. He soon became distinguished as a barrister, and in the reign of James II. he was made recorder of London, soon after which he was called to the degree of a serjeant of the law. By refusing to give assent to the arbitrary measures of the king, he was removed from the recorderhip of the city, but he returned with the approbation of an honest mind, and the regrets of the people, of whose cause he was always the advocate in spite of the authority and influence of the court. His principles were too well known for him to be forgotten in times of emergency, and he was chosen member of the convention parliament in 1688, and he was appointed one of the managers for the commons at the conferences held concerning the vacancy of the throne. In 1689 he was raised to the dignity of lord chief justice of the king's bench, and admitted to the honour of privy councilor. He refused the poitl of chancellor offered him at the death of lord Somers, and continued as chief justice till his death in 1759. He is memorable among the English judges for a thorough knowledge of the law, joined to an invincible firmness and resolution in supporting its authority. He held in contempt the affirmed powers of a house of commons, when those powers were evidently hostile to the common law of the land. He was the intrepid affector of the rights and liberties of the subject, and was remarkably jealous of the interference of the military power in the execution of the laws; of which he gave a very signal proof when applied to function, by the presence of one of his people, the proceedings of the military sent to quell a riot excited by the infamous practice of crimping. The chief justice asked the officer what he intended to do if the populace refused to disperse, he replied, "I have orders to fire upon them." "Have you fo?" said the judge, "then observe, if one man is killed, I will take care that you and every soldier of your party shall be hanged. Sir, acquaint those who sent you, that no officer of mine shall attend soldiers, and let them know, likewise, that the laws of this land are not to be executed by the fword. These things belong to the civil power, and you have nothing to do with them." Such patriotic and virtuous conduct as this chief justice ever manifested, has not frequently been found in persons filling that high office. Few instances, indeed, have been found, in which judges have not acted the upright and honourable part in all causes of individuals brought before them; they have no motive to act otherwise: but the inflexible integrity of a judge is brought to the test when great political questions are to be decided: when one of the people, who is but as dust in the balance, is about to be borne down by a whole branch of the legislature, in such a case lord chief justice Holt was tried, and his decision has infurred for him an unshaking immortality. British Biog.
and a weekly market on Saturday. Blomefield's History and Antiquities of Norfolk.

HOLT, a township and chapelry in the parish of Grefford, and hundred of Bromfield, Denbighshire, Wales, is seated on the banks of the river Dee, and was formerly a market town. At this place the river separates England from Wales, the county of Chester being on one side, and that of Denbigh on the other. The few is united by a bridge of 10 arches, which is said to have been built in the year 1347. On the banks of the river formerly stood a strong castle, which is now nearly levelled to the ground. It was garrisoned for Charles I. in 1643, but, with other fortresses in this part of the country, was taken by the parliamentary forces. The inhabitants of Holt, Denbigh, and Ruthin, jointly send one member to parliament. In 1821 this township contained 161 houses and 834 inhabitants. Pennant's Tour in Wales, vol. i. 400.

HOLT, a town of Norway, in the diocese of Christianland; 32 miles N.E. of Christianland. — Also, a town of Germany, in the duchy of Cleves; 27 miles S.E. of Cleves. N. lat. 51° 36'. E. long. 6° 26'.

HOLT, a village of England, in the county of Wilts, seven miles E. of Bath; it has a medicinal spring.

HOLT, in Rural Economy, the name of a morbid affection of the feet of different domestic animals. The hoof and feet in this state should be carefully examined, and the cause ascertained.

HOLT-casters. These have been found by experience to be of admirable efficacy in all scorbitic and scrophulous cases. An account of some very remarkable cures performed by them in these cases, was printed several years ago; and though known to be fact in the place, was disbelieved by almost every body before.

Mr. Lewis, formerly minister of the place, confirms their efficacy from his own observation; and observes that they are of an attenuating, astringent, and drying nature. The first of these properties they possess in common with all waters which dilute, attenuate, and fit the juices for passing the proper vessels; their astringency owes to the alum and iron which they contain; and their drying, absorbing, and healing qualities are probably owing to a quantity of sulphur, and a fine light oil, which they are impregnated with. Phil. Trans. N. 403.

HOLT's Creek, in Geography, a river of America, in the state of Kentucky, which runs into the river Kentucky, N. lat. 38° 37'. W. long. 84° 18'.

HOLTEN, a town of Norway, in the diocese of Drømrheim; 54 miles S. of Drømrheim.

HOLTEN, a town of Norway, in the government of Aggerhus, remarkable for its church, which is cut out of a rock; it is very ancient, and supposed, by Ulran Wormius, to have been an Eathan temple; 15 miles N.W. of Tongberg.

HOLTZBAUER, in Biography, in 1772 maestro di cappella to the elector palatine at Mannheim, when his electoral highness had the best instrumental band in Europe, and operas composed expressly for his theatre by the greatest masters of the time. Holtzbaer, who had been in Italy, was not only an excellent composer of symphonies on the model of the elder Stamitz, but the opera singing-master. The Danzi, afterwards Madame Le Brun, and the Allegranti, were his scholars.

HOLTZBOGN, an excellent performer on the violin in the service of the elector of Bavaria, in 1772. He was a scholar of Tartini, had a great hand, a clear tone, and more fire than was usual in performers of the Tartini school, which was rather remarkable for delicacy, expression, and high-finishing, than for spirit and variety. Holtzbohn wrote well for his instrument, and we heard him play a very masterly concerto of his own composition.

HOLTZHAUSEN, in Geography, a town of Germany, in the bishopric of Münster; 8 miles N.W. of Münster.

HOLTZKIRCHEN, a town of Bavaria; 18 miles S.S.E. of Munich.

HOLUAN, HOLWAN, or HuUAN, a town of the Arabian Trak; 110 miles N.N.E. of Bagdad. N. lat. 34° 50'. E. long. 44° 54'.

HOLUAN, a town of Egypt, on the right bank of the Nile; 12 miles S. of Cairo.

HOLUM, or HOLUM, or Holt, a town of Iceland, at the mouth of a small river, the fee of a bishop, founded about the year 1106, and since improved by Christiern III. Here are a school, cathedral, and printing office. N. lat. 65° 43'. W. long. 17°.

HOLWELL, John Zephaniah, in Biography, was born about the year 1759. He went out in early life as a writer in the service of the English East India company, and by his affiduity he gradually rose to office, till the year 1756, when he was appointed second in council to Lord William. At this period, an offence having been given to the nabob of Bengal, induced him to lay siege to that fort with a powerful army. The governor fled, and the command devolved on Mr. Holwell, who, with a few men, was resolved to defend the place to the last extremity. He was, however, obliged to surrender, but on the promise of security to their persons, in violation of which he and his men were shut up in a small room, since denominated the black-hole of Calcutta, which see. Of the survivors who escaped this infernal charnel-house, Mr. Holwell was one, who became the historian of the sufferings which were endured on that occasion; and when Calcutta was brought under the British dominion he raised a monument on the spot, at his own expense, to the memory of the unhappy victims, and to record the infamy of him who could perpetrate so black a deed. On his return to England Mr. Holwell wrote various tracts upon the concerns of the India Company, and he entered deeply into the history and mythology of the natives of Hindooostan, concerning which he gave the public some curious information in a work entitled "Interesting Historical Events relative to the Provinces of Bengal and the Empire of Indostan." In this he gives a very particular account of the Gentoos Shaftahis, which he represents as the oldest religious institute extant, and the genuine source of the mythology and cosmogony of the Egyptians, Greeks, and Romans. He published another work, in 1788, connected with this subject, entitled "Dif- ferations on the Origin, Nature, and Purpoffs of Intelligent Beings," &c. The idea that men are fallen angels, condemned to suffer in human bodies for the sins of their former state, is the leading principle of this production. Mr. Holwell was author of several other pieces, one on inoculation for the small-pox in the East Indies, with the mode of treating the disease in that part of the world, and one entitled "A New Experiment for the Prevention of Crimes," which chiefly consists in propofed premiums for the practice of virtue. He died in 1798, much respected by all who knew him. His works display a benevolent heart, and a liberal way of thinking. There is still living, at a very advanced age, in the neighbourhood of London, Captain Mills, one of the fellow sufferers with Mr. Holwell, in the black-hole of Calcutta.

HOLY, holz, Saxon, or hoylegh, Dutch, from hál, healthy, or in a state of salvation. The term is variously applied; sometimes in the same sense with good, or religious, or sacred, and sometimes for hallowed, or appropriated to religious
HOL

Archdall's general, the fleur-de-lis, the gold and the Botany, our wear Archdall, e. was observed to pious or religious purposes. In this sense it has been applied to persons, places, and things. See HOLINESS.

HOLY, Cape, in Geography, a cape in the Frozen ocean. N. lat. 72° 32'. E. long. 179° 40'.

HOLY FIRE. See FIRE.

HOLY of Holies, called also the "molt holy place," and the "oracle," because God here gave his answrers to the high priest, when consulted by him, an apartment of the Jewish temple, which was divided, in the first temple, from the "holy place" by a partition of boards overlaid with gold, in which there was a door-place with a vail over it. It was 20 cubits in length. Although the "holy place" was reckoned very sacred, yet it was not to be compared in this respect with the "molt holy," which was regarded as the palace of God. For this reason none but the high priest was permitted to go into it, and that but once a year, viz. on the great day of expiation (Exod. xxx. 10. Lev. xvi. 2. 15. 24. Heb. ix. 7.), on which day, as the Jews tell us, it was lawful for him to go in several times. This part of the temple, as well as the whole building, was surrounded with rooms and apartments for different uses. The roof of the "holy of holies" was not flat, as in the other parts of the temple, and in eastern houses in general, but sloping, as in our buildings; and, according to Josephus (De Bello Jud. i. vi. c. 6.) it was covered and armed all over with pointed spikes of gold, to keep off the birds from nesting upon it. Although the roof was inaccessable to all, yet there was round it a kind of rail or balustrade, according to the law (Deut. xxvii. 8.) to keep any one from falling down that should happen to go there. The "holy of holies" was at the west end of the temple, and the entrance into it toward the east, contrary to the practice of the heathens. The greatest ornament of the "holy of holies" was wanting in the second temple, viz. the Ark of the Covenant, or Testament, which fee.

HOLY PLACE, or Sanctuary, an apartment of the Jewish temple called by the Jews the "outer house" (it being fuch in respect of the "holy of holies"), was situated between the porch and the moss holy place, being 20 cubits broad, and 40 in length and height. It had two gates, one of which was called the "inlet," through which they passed in order to open the "great gate," which had four folding doors. The sanctuary was divided from the holy of holies neither by a wall nor gate, but only by a double vail. This is supposed to have been the vail which was rent in twain at our Saviour's death (Matt. xxvii. 51.), because it was to be of no further use. It seems to be alluded to in Rev. xi. 19. xv. 5. See SANCTUARY.

HOLY Ghost, Order of the, is a military order in France; the principal in point of dignity in that kingdom. It was instituted by king Henry III. in 1579, in memory of three great events happening on the same day, or Whit-funday: viz. his birth, ascension to the crown of France, and election to that of Poland; the order was to consist of a hundred knights only, who, to be admitted, were to make proof of their nobility for three deficients.

The king was the grand-master, or sovereign, and took the oath as fuch on his coronation day; whereby he solemnly vowed to maintain for ever the order of the Holy Ghost, and not to suffer it to flourish, fall, or diminish, so long as it should be in his power to hinder it; nor even to attempt to alter or dispence with any of the irreconcilable statutes of the order. The knights were all to wear a gold cross, hung about the neck by a blue silk ribband, or collar, lanyard at the left shoulder; and the officers and commanders are also to wear the same crosses, embroidered in silver, sewed on the left side of their cloaks, robes, and other upper garments.

Before they received the order of the Holy Ghost, that of St. Michael was conferred, as a necessary degree, for which reason their arms were surrouded with a double collar.

The collar of the order, at its first institution, was composed of fleurs-de-lis or, cantoned with flames of the same, enamelled gules, intermixed with three cyphers, or monograms, of gold, composed of the letters H and L, enamelled white, which letters were the initials of the institutors name, and of that of his wife Louisa of Lorraine. Henry IV. altered the cypher into a trophy of arms. Afterwards the collar was composed of fleurs-de-lis, cantoned with flames and trophies of arms; and at the bottom hung a gold crofs of eight points, enamelled on the edges white, with a fleur-de-lis or, at each angle, and in the middle a dove. In an oval, on the back of the crofs, was represented St. Michael trampling on the dragon, all proper.

HOLY Ghost, Order of. See DOVE.

HOLY Ghost, Crofs of the, in Heraldry, consists of a circle in the middle of a crofs, and on it the Holy Ghost, in figure of a dove: the four arms are drawn narrow from the centre, and widening to the ends, where the returning lines divide each of them into two sharp points; upon each of which is a pearl.

From the intervals of the circle between the arms five fleurs-de-lis. This was the crofs worn by the knights of the order of the Holy Ghost in France.

HOLY Road, in Geography, a bay in Newfoundland island, at the head of Conception bay.

HOLY REFE, or ROCK-ROSE, in Botany. See CISTUS.

HOLY SEPULCHRE of Jerusalem, Knights of the order of the, an order which, according to fome, was instituted by Godfrey of Boulogne, on the seventeenth day of July, in the year 1099; and, according to others, by his brother Baldwin, second king of Jerusalem, in the year 1103. The badge of this order was a crofs potent gold, cantoned with four crofses of the same, without any enamel, pendant at the breadth to a black ribband; and a like crofs embroidered on the left side of the white cloak or mantle, which the knights were conjointly to wear.

HOLY THISTLE, in Botany. See CENATARE ABUNDAN.

HOLY Thursday, is what we otherwise call Ascension Day.

HOLY Week is the last week of Lent, called also Passion Week.

HOLY Year is sometimes used for the year of jubile (which fee); and sometimes for the ecclesiastical year of the Jews. See YEAR.

HOLY CROSS, in Geography, a village in the county of Tipperary, province of Munster, Ireland, remarkable for the ruins of an abbey which belonged to the Cistercian order of monks. The lands belonging to this abbey were an earldom, and the abbey, according to Archdall, was styled earl of Halyerpis; he was certainly a baron of parliament, and was usually vicar-general of the Cistercian order in Ireland. A particular account of the buildings may be found in Archdall's "Monasticon Hibernicum;" but it will suffice to observe here, that they appear to have been very unequal, some being built of marble and highly finished, whilst other parts are miserably mean. These ruins cover a considerable space, near the banks of the river Suir. A parish church and a few wretched cabins are the only remains of
of a once celebrated place. It is seven miles from Cashel, on the road to Thurles and Nenagh.

HOLYHEAD, a sea-port, market-town, and parish in the island of Anglesea, North Wales, stands on a peninsula at the western end of the isle. In the British language it is called Caer-Gybi, or the fort or castle of Gybi. Having been for many years a station for vessels that fall between Ireland and England, it has thereby become a place of trade and public resort. The distance from Holyhead to Ireland is twenty leagues; and for the conveyance of letters, passengers, &c., between those places, one packet fails every day in the week excepting on Thursdays. It generally reaches the opposite coast in twelve hours; but in stormy or calm weather, the time of the passage is very uncertain; sometimes the vessel has remained at sea for two or three days, but when the wind is favourable, the voyage may be performed in six, seven, or eight hours. The church-yard at this place is a vast mass of rock, close to the sea, and is en- vironed by a wall. Pennant described this to be of seventeen feet high, and six thick on three sides of the inclosure, and on the other side it has only a parapet wall, the natural boundary being a precipitous rock. "At each corner of the wall is an oval tower. The masonry of the whole is evidently Roman: the mortar very hard, and mixed with much coarse pebble. Along the walls are two rows of round holes, about four inches in diameter, which penetrate them. The use of this harbour to the Romans, in the passage from various places to the ports of Lancashire and that of Cheshire, is very evident. They could not find a better place to run into, in case of hard weather, than this, as it projected farthest into the Vergilian sea; so that they could reach it with less danger of being embayed than in any other place." (Pennant's Tour in Wales, vol. ii.) In the vicinity of the town, the author visited and has left us accounts of other antiquities. On the summit of the hill called Pen-Caer-Gybi, are some re- mains of an ancient circular building, which Mr. Pennant conjectures was a Roman Pharus, or watch-tower. Remains of a long wall, built without mortar, were found on the side of the hill; and some ruins of an edifice, called Capel y Gores, were remaining between the town and the mountain. In the town was a religious house, said to have been erected in the latter part of the fifth century. A college was also founded here soon after the year 1137, by Owia ap Cynddelw, lord of Llys-Llithon. The present parish church belonged to the college; but the oldest parts of the archi- tecture do not appear to be anterior to the reign of king Edward III. A public school was established here in 1544. A large inn and hotel, an assembly room, and some baths have been erected at Holyhead, within the present century, and various improvements have been lately made to the town and harbour. The former consists of one principal street, with several detached buildings, and according to the population report of 1801 then contained 503 houses, and 2132 inhabi- tants. Here is a weekly market on Saturdays. The harbour is formed by cliffs beneath the church-yard, and a small island called Ynys-Gybi, on which is a light-house. Pennant's Tour. Beauties of England and Wales, vol. xvii.

HOLINESS, or HOLINESS, sanctity; the quality which constitutes or denominates a perfon or thing holy; i.e. pure or exempt from sin.

HOLINESS is also used in respect of persons and things that are sacred; i.e. set apart to the service of God, and the uses of religion.

In this sense we say, holy days, holy ordinances, the holy Bible, holy Gospels, holy war, &c. The Roman Catholics call the inquisition the holy tribunal; the see of Rome, the holy see, &c.

HOLY oil, holy water, &c. See UNCTION, WATER, &c.

Palæstine is particularly called the holy land; and Jerusalem the holy city. Princes formerly made a practice of going to signalize their religion in the Holy Land; who would have manifested the more genuine spirit of religion by sitting at home. See CROSADE.

In Romish countries, one-third part of the year is taken up in holy days, saints' days, &c. See FEASTS.

Urban VI. issued out an edict in the year 1643 for diminising the number of holy days.

In Scotland they observe no fixed holy days, besides Sundays.

By a decree issued at Paris, April 9, 1802, the feasts to be celebrated in France, besides Sundays, are, the nativity of our Saviour Jesus Christ, Ascension day, the Assumption of the most blessed Virgin, and the feast of All-saints.

HOLINESS is also a title of quality, attributed to the pope, as that of majesty is to kings.

Anciently the same title, holyness, was given to all bishops; as appears in St. Augustine, Fortunatus, Nicholas I., Caiffodore, &c. St. Gregory compliments some of his contemporary bishops with your beatitude and your holyness.

The Greek emperors of Constaninople were also addressed under the title of holyness, on account of their being anointed with holy oil at their coronation. Du Cange adds, that some of the kings of England have had the same attribute; and that the Orientals have frequently refused it to the pope.

HOLY-ROOD DAY, a festival observed by the Roman Catholics, in memory of the exaltation of our Saviour's cross. See CROSS and EXALTATION.

HOLY-WATER SPINKLE, among Hunters, signifies the tail of a fox.

HOLYWELL, in Geography, a market town and parish in Flintshire, North Wales, derives its name from a copious spring, or well, which was much frequented in former times by religious devotees, who fancied that its waters were supernaturally efficacious in curing certain disorders and purifying the body. In the present day, the fame stream is rendered more useful to mankind, by being applied to mechanical and manufacturing purposes. It is so highly important and singular, and its history so illustrative of ancient monastic superstition and craft, that it will be interesting to narrate a few particulars. The legendary origin of the well flates, that Wenifred, or St. Wenifred, was a beautiful and devout virgin, who lived in the early part of the seventh century. She was placed under the protection of a relation, who had founded a church here. A young prince, named Craddock, attempted to seduce her, but fled towards the church for safety. In her road to this place of sanctuary, she was overtaken by the prince, who, enraged by disappointment, struck off her head. "This, like an elastic ball, bounded down the hill, through the door of the church, and up one of the aisles, directly to the altar, where her friends were assembled at prayers; rolling here, a clear and copious fountain immediately gushed out. St. Beuno snatched the head, and again joining it to the body, it was, to the surprise and admiration of all present, immediately reunited to the body." Such is the monkish origin of the well: and when such a miracle was industriously circulated, it would necessarily excite the astonishment and reverence of the credulous. Not satisfied with such fables, the present age...
HOM

age has assigned a natural and probable origin to the spring, by ascribing it to physical causes. At the foot of a steep hill, and from an aperture in a rock, rushes forth a torrent of water, which, from its quantity and regularity, is calculated to astonish the ignorant and interest the geologist. It has been ascertained that this spring discharges not less than eighty-four hogheads of water in a minute. This is never known to freeze, and the current rarely ever varies in quantity; and from its rapid course and quantity, it becomes of inestimable value, for though the water has only a mile and one-fourth yards to flow in its progress to the sea, it turned, a few years ago, the machinery to eleven different extensive mills. These appertained to so many manufactories, &c., for cotton and twill, corn, brass-battery copper, copper wire, brass-milling, &c. Connected with these were nearly forty vessels, from thirty to fifty tons burthen each, to convey the several manufactures and the materials to and from Liverpool and other sea-ports. Over the well is a beautiful polygonal building, supported by pillars and arches. The roof, says Mr. Pennant, is most exquisitely carved in stone. Sculptured ornaments of grotesque animals, armorial insignia, &c., are attached to different parts of the building. Some of the latter relate to the Stanley family, to none of whom it was probably erected, either in the reign of Henry VI. or Henry VII. An apartment over the well was a free chapel.

Of Holywell town, Mr. Bingley observes, that he knows of none in North Wales that, in a commercial view, is of more importance. The numerous manufactories in its vicinity, and its easy access to the sea, have rendered it the great mart of this part of the kingdom. The town is spacious, but irregular, pleasantly situated on the slope of a mountain, which extends nearly to the water. Many of the houses are good, and give to it an air of considerable opulence. At the base of the hill, near the well, is the parish-church, which was built in the year 1769, on the site of a more ancient edifice. "It has only one bell," says Mr. Pennant, "and that not to be heard at any distance; so that the congregation is assembled by a walking-keelepe, a man with a small bell who sounds the notice through the streets." At a short distance north of the town, in a narrow, retired vall, are some remains of Basingwerk or Greenfield abbey. Of this building the walls, and some pillars of the refectory, are the chief remains. The knights templars had an elegant chapel here. Vestiges of Basingwerk castle remain on an eminence near the monastic ruins; also, some mounds called Watt's dyke: this was a bold rampart of earth, which extended from Holywell to Olivefield in Shropshire, and runs nearly parallel with the more noted Offa's dyke. Pennant's History of Shropshire and of the North Wales, two vols. 8vo. 1754.

HOLZAPFIL, a town of Germany, and capital of a county of the same name, situated on the borders of the Lahn, erected into a principality of the empire by Ferdinand III. This town lies at the foot of a mountain, on which is the tower of an ancient castle, the original seat of the princes of Nassau; 4 miles NE. of Nassau. N. lat. 50° 22', E. long. 7° 52'.

HOLZKIRCHEN, a town of Germany, in the county of Wertheim; 9 miles E. of Wertheim.

HOMA, a town of South America, in the government of Buenos-Ayres; 135 miles S. of Corrientes.

HOMA, in Surgery, an anafarous or drophical swelling.

HOMAGE, in its general fenate, denotes the reverence, respect, and submission, which a person yields his master, lord, prince, or other superior.

The word is formed of the Latin homo, man; because when the tenant takes his oath, he says, "I give you my homage; I become your man;" for the same reason homage is called manhood; so the homage of his tenant and the manhood of his tenant are the same. Coke on Little, fol. 64.

HOMAGE, Homagium, Hominium, in Law, is an engagement or promise of fidelity; which the vassal, or tenant who holds a fee, renders to the lord, when admitted thereto.

In the original grants of lands and tenements, by way of fee, the lord did not only oblige his tenants to certain services, but also took a submission, with promise and oath, to be true and loyal to him, as their lord and benefactor.

This submission, &c., is called homage; the form whereof, as appointed by Stat. 17 Edward II. is in these words: "When a free man shall do homage to his lord, of whom he holdeth in chief, he shall hold his hands together, between the hands of his lord, and shall say thus: "I become your man from this day forth, for my life, and for worldly honours, and shall owe you my faith for the land I hold of you, fasting the faith that I owe unto our sovereign lord the king, and to mine other lords;"'

In this manner the lord of the fee, for which homage is due, takes homage of every tenant, as he comes to the land or fee. Glanvil, indeed, excepts some women; who only perform homage by their husbands; because homage is supposed to have a more immediate relation to service in war: but Fitzherbert denies this exception. Nat. Brev. fol. 157.

It is added, that bishops do no homage, but only fealty; and probably for the same reason as women. Yet do we read, that the archbishop of Canterbury does homage on his knees to our kings, at their coronation; and that the bishop of Man was homager to the earl of Derby.

Fulbeck reconciles this: "by our law, says he, a religious man may do homage, but may not pay to the lord, "I give you my homage;" because he has already professed himself to be only God's man; but he may say to him "I do unto you homage, and to you shall be faithful and loyal."

Homage and fealty, or faith, are two distinct things, and different duties. See Fealty.

Originally homage was performed by the gentlemen, and fealty by the peasant. Others say, that homage was that performed to the lord himself, and fealty to his feuchoal, or steward, for his lord. It is added, that he who holds lands for term of life, owes homage, but not fealty.

Bishops take the oath of fealty and loyalty to the king, for the temporalities they hold of him, or which are referred to them; and at the same time do homage to their sovereign.

Homage Fee. See Fee.

Homage: Seges, a more extensive kind of homage, whereby the vassal held of the lord, not only for his land, but his person; so that the lord might use him against all mankind, whether within or without the kingdom; excepting against the king. See Liege.

This kind of homage was rendered bare-headed, with the hands joined on the Gofpels, and one knee on the ground, and without sword, girdle, or spurs. By which it was distinguished from frank homage. See Allegiance.

There are also other distinctions of homage; as, Homage, Plain, or homage of a fee; where no oath of fidelity is taken.
Homage of Devotion, which is a donation made to the church; and does not import any duty, or service at all.

Homage of Peace, which a person makes to another after a reconciliation, as an assurance that he will no longer disturb his peace, &c.

Homage, Simple. See Allegiance.

Homage, again, is divided into new, or that performed upon the grant of the fee; and aunciestrel.

Homage, Aunciestrel, is where a man and his ancestors, time out of mind, had held their land of the lord, and his ancestors, by homage.

If such lord have received homage, he is bound to acquit the tenant against all other lords above him, of every manner of service; and if the tenant has done homage to his lord, and is impeded, and vouches the lord to warranty, the lord is bound to warrant him; and if the tenant loses, he shall recover in value against the lord so much of the lands as he had at the time of the voucher, or any time after.

Homage is also used for a jury, in a court-baron, because commonly consisting of such as pay homage to the lord of the fee. See Jury, Court-baron, and Manor.

Homage is also taken, in some cases, for the particular place, or district, where the services are to be performed.

HOMAGER, a person that does, or is bound to do, homage to another.

HOMAGIO RESPECTUANDO, a writ issued to the escheator commanding him to deliver feisin of land to the heir of the deceased, in the time of James II.

HOMAGIUM REDDENDUM has been used to signify, to remove homage: as where the tenant or vassal, made a solemn declaration of disavowing his lord, for which there was a form prescribed by the feudal laws.

Gen. Ch. Cal. Perianthi of one leaf, divided into six or seven lanceolate, acute, widely spreading segments. Car. Petals six or seven, ovate, flat, a little longer than the calyx, spreading; stamens consisting of six or seven flat glands, which are alternate with the petals. Stam. Filaments varying from 18 to 28, awl-shaped, erect, the length of the corolla, three or four of them being inserted into the receptacle, between the glands, within the base of each petal; anthers roundish, small. Pyj. Germin roundish, hairy, imbedded in the base of the calyx; styles three or more, erect; stigmas simple. Peric. Capsule woody, ovate, of one cell. Seeds numerous, small.

Eff. Ch. Calyx six or seven-cleft. Corolla of six or seven petals. Stamens three in a bunch. Capsule of one cell, with many seeds.

Obf. All the parts of the flower are permanent. This genus is supposed to be akin to Blackwellia of Commerson and Joffren, (which is different from Blackwellia of Gartner, t. 17), but the inoration of the stamens is thought to distinguish them; see Willd. Sp. Pl. v. 2. 925. Lamarck. Illust. t. 412. Jull. 343. We a strong inclination to unite the two genera, but in deference to such authorities shall now only speak of undoubted species of Homalium.

Vol. XVIII.

2. H. Racoubea. Willd. n. 2. Schwartz. Ind. Occ. v. 2. 991. Lamarck Illust. t. 483. f. 1. (Raconbeau; Aubl. Guian. 590. t. 266.)—"Leaves elliptical, with broad serratures. Partial flower-flanks shorter than the calyx. Petals obvate.—A native of the woods of Guiana, flowering and bearing fruit in May.—Seen about four feet high, bearing tortuous branches six or eight feet long. Leaves alternate, smooth, ovate, obtusely pointed. Flowers yellow. This species is very nearly allied to the last, but differs in having its leaves almost toothed and leathery, flowers larger, and fruit woody.

3. H. angustifolium. Sm. MS. Leaves elliptic-lanceolate, slightly wavy. Partial flower-flanks very short. Petals obvate.—Native of Sierra Leone, communicated by Sir Joseph Banks in 1752.—The leaves are much smaller than in the last, narrower, and nearly entire. Cheese-like, simple, scarcely so long as the leaves. Flowers nearly sessile, smaller than either of the preceding, and essentially distinguished by the obovate shape of their petals.

HOMALOCENHRUS. See Lensia.

HOMAN, or Osman, in Geography, a town of Fess, in the province of Habat, between Akaser-querib, and Azilia.

HOMBERG, William, in Bibliography, a celebrated physician and chemist, was born at Batavia, in the island of Java, in 1652. His father was a Saxon gentleman, who had entered into the service of the Dutch East India Company, and ultimately obtained the command of the arsenal of Batavia. He quitted that settlement however, and went to Amsterdam, where his son advanced rapidly in the course of his education, and became devoted to study. He went to Jena, Leipzic, and Magdeburg, where he pursued the study of the law, and was admitted to the bar in the last-mentioned place, in 1674. But without neglecting his profession, he began to take great interest in the study of natural history; and becoming acquainted with Otto Guericke, who had invented the air-pump, and was pursuing experimental philosophy with celebrity, he attached himself to this able man in order to be instructed in those sciences. His increasing desire for knowledge induced him to quit Magdeburg, and he fett off to Italy, where he applied to the study of medicine, and particularly of anatomy and botany at Padua. When at Bologna, he discovered, by his experiments, the method of making the Bologna stone luminous, which had been almost lost. At Rome he formed an intimate acquaintance with Marc Anthony Cecho, a Roman nobleman, an able mathematician, astronomer, and mechanist, who was exceedingly dextrous in making large lenses. Homberg applied ardently to these studies, as well as to painting, sculpture, and music, in which he made great progress. Leaving Italy, he travelled through France, and visited England, where he laboured for some time with the celebrated Sir Boyle. He was recalled to Holland, and afterwards improving himself in anatomy under De Graaf, rejoined his family, then residing at Quedlinburg. He had now decided on adopting the profession of medicine, and took the degree of
of M.D. at Wittenberg; but he was still more inclined to the pursuit of his favourite sciences, than to settle in the practice of his profession. Accordingly, he travelled to the north, in order to visit Baldung Kinkel, the inventors of two sorts of phosphorus, which, at that time, made a considerable noise; and he obtained their methods of preparing it, in exchange for some other chemical secrets. He proceeded thence to the mines of Saxony, Hungary, Bohemia, and Sweden, in order to pursue his inquiries respecting the metals; and at Stockholm he laboured, together with M. Hierus, first physician to the king, in the laboratory recently established there by his majesty. He was still urged by the love of liberty and science to pursue his travels, notwithstanding the wishes of his family that he should settle in his own country, and he repeated his journey to Holland and France, where he was received by the scientific men with great favour. At the urgent request of his father, who was now impatient at his delay, he had fixed the day of his departure from Paris, when M. Colbert, in the name of the king, made him such advantageous offers, as induced him to remain in that metropolis. In 1682 he embraced the Catholic religion; but the next year he lost his patron Colbert, and was dishonoured by his father for having changed his religion. In 1685 he was induced to pay a second visit to Rome, where he remained some years, practicing medicine with great success. On his return, his extensive information, his phosphorus, his microscopes, an air-pump which he had invented, more perfect than those of Guericke and Boyle, and various operations and discoveries, soon acquired for him a distinguished rank among the most eminent philosophers. In 1691 he was admitted a member of the Academy of Sciences, and through the favour of the abbé Bignon, director, he obtained the uninterrupted use of the laboratory of the academy. In 1702 the duke of Orleans ordered a magnificent laboratory, fitted up in the completest manner, to be put under the direction of Homberg, to whom he also assigned a pension; and in 1704 the duke appointed him his first physician. Homberg married in 1708 the daughter of M. Dodart, an eminent physician, with whom he lived but a few years, being carried off by a dysentery, to returns of which he had been for some time liable, in September 1715, at the age of sixty-three. Homberg, although of a weak constitution, was exceedingly laborious. His acquisitions were very extensive; for besides a thorough knowledge of every department of natural philosophy and chemistry, he was well acquainted with history and languages. His mind was capable of a degree of attention, which enabled him to make observations, that might have escaped others; and his method of explaining them was simple, accurate, and concise. He never published any large work, but he furnished a great number of curious and interesting memoirs to the Academy of Sciences, which were printed in their collections. Gen. Biog. Eloy. Dict. Hill.

HOMBERG, or Homburg, in Geography, a town of Germany, in the duchy of Berg; 24 miles E.S.E. of Cologne.—Also, a town of the principality of Hesse Cassel, situated on the Zeis. It contains an iron-forgo and a glass manufacture; 20 miles S. of Cassel. N. lat. 51° 21'. E. long. 9° 20'.

HOMBURG vor der Höhe, or Homburg in the mountains, a town of Germany, which gives title to a branch of the house of Hesse, called Hesse-Homburg; seven miles N. of Frankfort on the Main. N. lat. 50° 15'. E. long. 8° 32'.

HOMBERG au der Obm, a town of Upper Hesse, on the Ohm, with a castle on an eminence; 11 miles S.E. of Marburg. N. lat. 50° 43'. E. long. 9° 1'.

HOMBERG, or Hornburg, a town of Wurtzburg; 14 miles W. of Wertheim.

HOMBERG, or Homburg, a town of France, in the department of Mont Tombereau, and chief place of a canton, in the district of Deux-Ponts: five miles N.N.W. of Deux-Ponts. N. lat. 49° 11'. E. long. 7° 21'. The place contains 1761, and the canton 4561 inhabitants, in 14 communes.

HOMBERG, or Horkenburg, a town of the duchy of Wurtzburg, situated on the Main; 15 miles W.S.W. of Wurtzburg.

HOME, HENRY, Lord KAMES, in Biography, eminent as a judge and writer, was born in the county of Berwick in 1696. He was educated at home till he was of a proper age to be sent to the university of Edinburgh, to study the law as his future profession. The acuteness of his genius, and the success with which he applied himself to professional studies, were displayed by a number of publications on the civil and Scotch law. The first of these, published in 1728, entitled "Remarkable Decisions of the Court of Session," which he afterwards published, much enlarged, in the form of a dictionary in two volumes folio. Without enumerating all his works on legal subjects, we may mention, as the most curious of his productions in this class, "Historical Law Tracts," containing fourteen separate treaties upon interesting subjects connected with the judicial and constitutional history of the country. He gave a multitude of proofs of indefatigable industry, and profound knowledge, which raised him to the first rank in his profession, and in 1753 he was advanced to the bench of judges of the court of session, on which promotion he took, according to the custom of Scotland, the title of lord Kames, and his authority as a law writer is still quoted at the Scotch bar, with the same respect as is paid to the luminaries of law in the English courts. We are now to consider lord Kames in the character of a literary man; from his earliest days he had a decided turn for metaphysical discussions, and maintained a correspondence on these subjects with bishops Berkeley and Butler, Dr. Clarke, and other great men who have become illustrious, by their talents, in the annals of their country. In 1752 he published "Essays on the Principles of Morality and Natural Religion." In this work he endeavoured to establish several general principles of action. He also openly avowed the doctrine of philosophical necessity, which had become obnoxious by being adopted by some writers who rejected revealed religion; and though he closely allied it with the duties of morality and real religion, he underwent many attacks on its account. In 1761 he published his "Introduction to the Art of Thinking," which consists of maxims and general observations on human nature and the conduct of life illustrated by examples. His great work, the "Elements of Criticism," was given to the world in the year 1762, which is a truly original performance, and which discarding all arbitrary rules of literary composition derived from authority, establishes a new theory upon the principles of human nature. In 1773 he appeared again before the public in his "Sketches of the History of Man," in two volumes 4to. This work comprises many subjects of the greatest importance relative to human society. They are not all treated with equal accuracy, and some of the examples are taken from suspected sources. He published, in 1777, "The Gentleman's Farmer," being an attempt to improve Agriculture by subjecting it to the Test of rational Principles." This work was the result of much
much observation and practical knowledge of the business of farming, which he acquired by the pursuit on a large scale, on his own estate, in Perthshire. In 1781 he published another work, entitled "Loose Hints upon Education, chiefly concerning the Cultivation of the Heart," and in the following year he died at the age of eighty-six. Lord Kames was as much distinguished by his vivacity in conversation, as the extent of his legal knowledge and literary labours. To a very advanced age he was the life and soul of all the parties with which he mixed: no topic could be started above or below his powers of diffusion. Lord Kames was in the habit of rising very early, and he was a man of great regularity and order in the disposition of the several parts of his time; he seemed to know the value of each minute as it passed, and it was thus he rose to the high eminence which he possessed, in opposition to all the obstacles which the tumult of public business could throw in his way. In the friendships which he formed he was ardent, zealous, and sincere. He attained to constant habits of devotion, and a perpetual sense of the Deity, and a veneration for an over-ruling Providence ever dwelt upon his mind. From this source arose that propenfity, which appears in all his writings, of investigating final causes, and tracing the wisdom of the Supreme Author of nature. A few days before his death he went to the court of Seilson, addressed all the judges separately, told them he was speedily to depart, and took a last and affectionate farewell.

HOME, in Sea Language, denotes either the situation of some object, where it retains its full force of action; or where it is properly lodged for convenience or security. In the former sense it is applied to the fails, and signifies, that their claws or lower corners are close to the blocks upon the yard-arm, immediately beneath them: hence to haul home the top-fail-foots, is to extend the bottom of the top-fail to the lower-yard, by means of the foats. In the latter sense, it usually refers to the flowage of the hold; as a cask, &c. is said to be home, when it bears against and lies close to some other object: or to the anchor, which is said to come home, when it leaves from the ground, by the effort of the cable, and approaches the place where the ship floated, at the length of her mowing.

HOME BREEDS, in Rural Economy, a term signifying such breeds of cattle or other foarts of live-flock, as are bred and reared in the particular district or county.

HOME-FIELD, or farm-yard, in Geography, a district of Naffau, in the province of Quebec, Upper Canada, so constituted by a proclamation of Lord Dorchester, in July 1788, and deriving its present name from an act of the provincial legislature. It is bounded E. by a meridian passing through the mouth of the river Trent; N. by the Ottawa river, into lake Tomiganning, and the bounds of the Hudson's bay company, and also by part of lake Huron; W. by a meridian passing through the eastern extremity of Long point, or the N. Foreland; and S. by part of lake Ontario, and part of lake Erie.

HOME, Harvest. See Harvest.

HOME-FIELD, in Rural Economy, a term frequently applied to the feite or situation of the farm-house, and other buildings including the farm-yard. It cannot be disputed that farms are of greater or less value in proportion to the conveniences which they possess, and the facility of the means of occupying them. It is well known that arable farms require an extent of buildings and other conveniences adequate to the sizes and particular kinds of them. Tenants are not unfrequently seen much checked and confused in their operations and improvements, as well as subjected to great waste of produce, in consequence of the want of a sufficient extent of farm offices. But on the contrary, it is occasionally to be noticed, that there is a prodigality of this fort of buildings, which incurs vast unnecessary expense, not only at first, but afterwards in the repairs that become requisite. The extent of buildings should consequently be well proportioned to that of the farm, and rarely extended much beyond it. All extremes must be most carefully avoided. See Farm, and Farm-Yard.

HOME-FIELD, the name of the situation or space of ground on which the farm-house, buildings, and offices are raised. The situations intended for this purpose should be chosen with much care and circumspection, regard being constantly had to convenience, water, and various other points of importance. See Farm-Yard, and Home-field.

HOMER, in Biography, justly celebrated as the prince of poets, flourished, according to Blair, about 900 years before the Christian era, according to Prieftlyk and others place this event half a century later. Seven cities disputed the glory of having given him birth, viz. Smyrna, Rhodes, Colophon, Salamis, Chios, Argos, and Athens, but the probability is, that he was born either on the continent of Leffcr Asia, or upon one of the islands near it. We have nothing certain respecting the life of this poet: critics have usually thrown aside as puripous and fabulous the life of Homer, said to have been written by Herodotus. The detail of circumstances contained in that piece is so circumstantial and minute, that it can scarce be credited. There seems no doubt that, notwithstanding the high reputation and walt celebrity which he has enjoyed for nearly three thousand years, he spent his life in poverty, wandering about from city to city, and from the court of one prince to that of another, obtaining temporary patronage from the recital of his poems. If he were blind he probably became so in his old age. The origin and composition of the poems attributed to Homer, are involved in as much obscurity, as the facts relating to his birth-place and birth. In his celebrated poems entitled the Iliad and Odyssej, the poet has displayed the most consummate knowledge of human nature, and rendered himself immortal by the sublimity, the fire, the sweetness, and elegance of his poetry. In his Iliad, Homer has described the reftoration of Achilles, and its fatal consequences in the Greek army before the walls of Troy. In the Odyssey, the poet has for his subject the return of Ulysses into his country, with the many misfortunes which attended his voyage after the fall of that city. The poems are each divided into 24 books, the fame number as there are letters in the Greek alphabet, and, though the Iliad claims an uncontested superiority over the Odyssey, yet the fame force, the fame sublimity and elegance prevail, though diversified of its more powerful fire: and the great author of the "Sublime," compares the Iliad to the mid-day, and the Odyssey to the setting-sun, and adds that the latter still preserves its original splendour and majesty, though deprived of its meridian heat. "Whether there were epic poems in the foat now attached to the word, primarily formed upon a determinate plan, and constituting a whole;—whether they were a fortuitous assemblage of detached parts, connected by some later hand, by means of assumed subject, or, lastly, whether these rhapsodies were the work of one author or of several, are questions which have exercised, and which still continue to exercise, the ingenuity of critics. There is no doubt that the constituent parts of their poems long wandered separately through the principal cities of Greece, and the whole of them are said by Plutarch to have been brought from Asia to Greece by Lycurgus, and their first arrangement, in the order we now have them, is ascribed to Philetatus. But whatever doubts these circumstances might throw upon the original plan of
their composition, it is contended that all the parts so mani-
festly conpire to that general purpose which is proposed in
the exordium, that they must have flowed from uniform
design. The difficulty of conceiving how such long works
could be accurately transmitted by memory through ages,
previously to the use of writing, increases the intimacy of
the question; but in answer to this it has been observed,
that the poetry of Homer was so universally admired, that
in ancient times, every man of learning could repeat with
facility any passage in the Iliad and Odyssey. These poems,
appear, from the very earliest times, were consulted as
authorities for local claims, and controverties were decided
respecting boundaries and prerogatives, by lines from the
catalogue of Homer's ships. Modern travellers have been
alludled to behold the different scenes which the poems of
Homer described 5000 years before, still existing in the same
unvaried form, and the navigator, who IEEEs his course along
the Egian sea, finds all the promontories and rocks which
appeared to Neop and Menelaus, when they returned victo-
rions from the Trojan war. By the ancients Homer was
venerated and worshipped as a god. The inhabitants of
Chios celebrated festival in his honour every fifth year:
and the people of Cos considered it as their greatest glory
that the poet of Greece was buried in their island.
Alexander was so much attached to the works of Homer, that
he usually placed them under his pillow, with his sword,
and he deposed the Iliad in one of the richest and most valuable
caskets of Darius, observing, that the most perfect work
of human genius ought to be preferred in a box the most
valuable and precious in the world. The best editions of
the Iliad and Odyssey are that by Dr. Barnes with the Greek
scholia, in two volumes 4to; that by Dr. Clarke published
in 4to. 1729, and that by the learned Heyne. The most
elaborate commentary is that by Eustathius, bishop of The-
salonica, and the best English translation is that by Pope:
thought Cowper's, in blank verse, is thought to come nearer
to the original.

Homer, in Geography, a military township of America,
in Onondago county, New York, on the head-waters of the
N. W. branch of Chenengo river; containing 612 inha-
bhabitants.

Homer, Omer, or Homer, a Jewish measure, containing
the tenth part of the epha. See Corpus and Measure.

HOMESOKEN, or rather HAMESOKEN; sometimes also
written Hamshka, and Hamshana, the privilege or protection
which every man enjoys in his own house.

HOMESTEAD, a tract of land situated in the town of
Westmoreland, on the river of the same name, about
miles E. of the cave of the same name.

HOMFELDS, in Geography, a town of Germany, in
the county of Lappe; 9 miles E. of Longow.

HOMICIDE, of homo, a man, and cide, I kill, in Com-
pozy Law, the killing of a man.

Homicide is divided into three kinds: vol. justifiable, ex-
cusable, and felonious. The first has no guilt at all; the
second very little; but the third is the highest crime against
the law of nature, which man is capable of committing.

Justifiable homicide is such as is owing to some unavoidable
necessity, without any intention or negligence in the person
that kills, and, therefore, without any shadow of blame. Of
this kind is the act of a magistrate or officer, who puts a
malefactor to death, in obedience to the law, and in the
execution of public justice. Homicide is also justifiable for
the advancement of public justice; as, where an officer, in
the execution of his office, either in a civil or criminal cafe, kills
a person that afflicts or offends him (1 Hal. P. C. 494. 1 Hawk.
P. C. 743) where an officer, or any private person, attempts to
take a man charged with felony, but is refited, and in the
endeavour to take him, kills him (1 Hal. P. C. 494.); where
officers, in case of a riot or rebellious assembly, endeavouring
to disperse the mob, kill them; such officers are justified
both by common law (1 Hal. P. C. 161.), and by the riot act, 1 Geo. I. cap. 5. Where prisoners
are killed by the gaoler or officer, in endeavouring to pre-
vent their escape (1 Hal. P. C. 496.); where trespiffers in
forests, parks, chases, or warrens, refuse to surrender to
the keepers, they may be slain: (21 Edw. I. 3, 3 & 4 W. & M. cap. 10.) But in all these cases there must be an
apparent necessity: so that the party could not be arrested or
apprehended, the riot could not be suppressed, the prisoners
could not be kept in hold, the deer-dealers could not but
deprive, unless such homicide were committed, without which
this kind of homicide is not justifiable. When one champion
killed another in battle, such homicide was justifiable, and
was imputed to the just judgment of God (1 Hawk. P. C. 741.)
Moreover, such homicide, as is committed for preventing
any forcible and atrocious crime, is justifiable by the law
of nature, and by the law of England. (24 Hen. VIII.
cap. 5.) Thus, if any person attempts a robbery or murder,
or endeavours to break open a house in the night-time, or
to burn it (1 Hal. P. C. 488.), and should be killed in
the attempt, the slayer shall be acquitted and discharged.
This is agreeable to the Jewish law, Exod. xxi. 2. to the
laws of Athens, and the Roman law of the Twelfth Tables.
The English law also justifies homicide in defence of designs
which see.

Execusable homicide is such as the law excuses from the
guilt of felony, though it implies some degree of fault and
blame. This is either per iniuriam, i.e. by misadventure,
or culpa prindendi, upon a principle of self-preservation in a
fucked almsy. See CHANCE-murder.

The first is, where a man doing a lawful act, without any
intention of hurt, unfortunately kills another; as where a
man has a butcher at work, the head of which flies off, and
dkills a flander-by, or where a person, qualified to keep a
gun, is shooting at a mark, and undesignedly kills a man
(1 Hawk. P. C. 73. 74.). Thus also, when a parent is
moderately correcting his child, a master his apprentice or
scholar, or an officer punishing a criminal, and happens to
occasion his death, it is only misadventure; but if he exceeds
the bounds of moderation, in the manner, the infraction,
or degree of punishment, and death ensues, it is at least
manslaughter, and in some cases, according to circumstances,
murder.

These two species of execusable homicide are similar in their
blame and punishment. Among the Jews, the slayn
even of enemies required a solemn purgation, which implies
that the death of a man, however it happens, will leave
some stain behind it. And the Moabitic law (Numb. c. 35.6)
prescribed certain cities of refuge for
him who killed his neighbour unawares, &c. But he was
not held wholly blameless, any more than in the English
law: for the avenger of blood might slay him before he
reached his asylum, or if he afterwards ventured out of it till
the death of the high-priest. In the imperial law likewise

4
HOMILY. Or, alarum, formed of alarum, assembly, originally signifies a conference, or conversation; but the word has since been applied to an exhortation, or sermon, delivered to the people.

The Greek homilia, says M. Fleury, signifies a familiar discourse, like the Latin firma; and discourses delivered in the church took these denominations, to intimate, that they were not harangues, or matters of oration and flourish, like those of profane orators, but familiar and useful discourses, as of a matter to his disciples, or a father to his children.

All the homilies of the Greek and Latin fathers are composed by bishops. We have none of Tertullian, Clemens Alexandrinus, and many other learned persons; because, in the first ages, none but bishops were admitted to preach.

The privilege was not ordinarily allowed to priests, till toward the fifth century. St. Chrysofom was the first prebendar that preached flatly. Origen and St. Augustine were allowed, but it was by a peculiar licence, or privilege. Photinus distinguishes homily from sermon; in that the homily was performed in a more familiar manner; the prelate interrogating and talking to the people, and they, in their turn, answering and interrogating him; so that it was properly a conversation; whereas the sermon was delivered with more form, and in the pulpit, after the manner of the orators.

There are several fine homilies of the fathers still extant; and, particularly, of St. Chrysostom, St. Gregory, &c.

The practice of compiling homilies, which were to be committed to memory, and recited by ignorant or indolent priests, commenced towards the close of the eighth century; when Charlemagne ordered Paul Deacon and Alcuin to form homilies or discourses upon the Gospels and Epistles, from the ancient doctors of the church. This gave rise to that famous collection, entitled the Homiliarium of Charlemagne, and which being followed as a model by many productions of the same kind, composed by private persons, from a principle of pious zeal, contributed much (says Mothes, in the chapter that follows) to nourish the indolence, and to perpetuate the ignorance of a worthless clergy. Ecclef. Hist. vol. ii. p. 254. 8vo. ed.

At the time of the Reformation there were several of these homilies composed and printed, and ordered to be read in such churches as were not provided with a sufficiently learned minister, in order to prevent unfound doctrine being taught in remote country places. The homilies of the established church of England are contained in two books; the former of which was published in the reign of Edward VI., and the latter in the beginning of the reign of queen Elizabeth. Both these are pronounced by the 35th article of the church to contain a godly and wholesome doctrine, and necessary for these times, i.e. for the times in which they were published. The authors of these homilies were the great reformers Cranmer, Ridley, Latimer, and Jewel. Bishops Tomline mentions, in his Refutation of Calvinism, 8vo. 1811, that not one of the peculiar doctrines of Calvin is mentioned in either of these two books: the word Predestination does not occur from the beginning to the end of the homilies; the word Election occurs upon one occasion only, and then it is used in its true scriptural signification, very different from that in which it is used by Calvinists; the word Reprobation does not occur at all: nothing is said of absolute decrees, partial redemption, perseverance, or irrepealable grace.

HOMILIES, CLEMENTINE. See CLEMENTINA.

HOMINE capto in vitandam, in Laws; a writ for apprehending him that has taken any bondman or woman, and led him or her out of the country, so that he or she cannot be reprieved according to law. See Withenham.

HOMINE legisando ad cussionem etiam pietatem, etiam pietas, a writ directed to a corporation for the choice of a new preton to keep one part of the seal appointed for statutes merchant, when a former is dead according to the statute of Acton Burnel.

HOMINE repudiando, a writ for the bailing of a man out of prison, when he is confined without commandment of the king or his judges, or for any cause that is repivable. But this writ is now seldom used; a writ of habeas corpus being used out on the necessary occasions.

HOMICIDE, formed of the Latin homo, humanis, man, and collo, I worship, in Antiquity, a name which the Apollinarists gave to the orthodox, to denote them worshippers of man.

As the orthodox maintained that Jesus Christ was Godman, the Apollinarists accused them of adoring a man, and therefore called them homicides.

HOMACKS, in Engineer, are used by Mr. Smeton to denote sink hills thrown up by the tide; sometimes also they are called paddocks.

HOMEDAL, in Geography, a town of Norway, in the diocese of Chritianand; 16 miles N.N.E. of Christiantand.

HOMOD, in Sea Language, signifies a hillyck, or small eminence of land resembling the figure of a cone, and appearing on the sea-coast of any country.

HOMONA, in Geography, a town of Hungary; 14 miles N.E. of Matrossfalva.

HOMO, Man, in Zoology. See MAN.

HOMOCENTRIC, composed of xos, familiar, and xos, common, or xos, centre, in Astronomy, a term of the same import with concentric.

HOMOCENTRO, in Natural History, the name of a genus of pebbles.

The word is derived from the Greek xos, familiar, and xos, colour, and expresses such pebbles as are not veined, but all of one simple and similar colour. These are bodies composed
composed of crystalline matter, considerably debarred by earth, and this of various kinds in the different species, but only of one kind in the same species, which is hence always of one colour, and not subjunct to veins. Of this genus there are only five known species; the white, red, yellow, blue, and green. All these are covered with external coats or crutons, like those of the common pebble.

Hill's Hist. of Fossil. p. 510.

HOMIPECTON, *H*omoepto*ton*, a figure in Heteristics, by which the weight is in the middle between the power and fulcrum, or the middle between the weight and fulcrum. See Levan.

The word homipecton is derived from *homoe*, same, and *ptoton*, corref, because in this species of lever the weight and power move in contrary directions.

HOMOEOTELEUTON, *H*omoeoteleuton, a figure in Rhetorics, whereby several verbs in a sentence are made to end alike; as, *eos deduci, eveh quam descrii malui* or, *ut vivis invidiose, delinquis istioiose, loquera odiose.

HOMOGENOUS, or HOMOGENAL, composed of the Greek *homousia*, like, and *genos*, kind, is a term applied to various subjuncts, to denote that they consist of similar parts, or of parts of the same nature and kind; in contradistinction to heterogeneous, where the parts are of different natures, &c.

Natural bodies are generally composed of homogeneous parts, as a diamond, a metal, &c. Artificial bodies, on the contrary, are amalgamates of heterogeneous parts, or parts of different qualities; as a building of stone, wood, &c.

HOMOGENEA VIR LIGHT, is that whose rays are all of one and the same colour, degree of refrangibility, and reflectibility. See Light.

HOMOGENEA VIR Numbers and Plants, are those of the same kind and nature.

HOMOGENEA VIR Surdis, are such as have one common radical sign; as 1/27 and 1/3. See Surd.

HOMOGENEA VIR COMPARATONIS, in Algebra, the known quantity in an equation, called also absolute number.

It is called homogenia comparationis, of comparison, to distinguish it from the other terms; which, though homogenous as well as this, is, e. alwys rised to the same degree of power, are not the quantities of which things are here compared or referred.

HOMOGRAMMII, *H*omeogrammii, among the ancients, an appellation given to the athletes who drew the figure letter, and on that account were to engage together; for when any number of athletes were to enter the lists, in order to determine with whom every one should contend, they threw into an urn a number of letters equal to that of the athlete, but so that there were always two letters of a fort, as two a's, or two b's. After these had been shaken together, the drew the letters out, and those who got the same letter were to fight each other.

HOMIOCADALECTON, *O*miocadalecton, in Rhetorics, a figure wherein the different parts of a fentence have the fame termination.

Homiocadalecton is used as a genus to denote similar terminations and words; and homioptopon and homiooteletun are made its species.

HOMIOERMICAL Principles, of *homo*, similar, and *eidos*, part, a peculiar kind of principle, supposfed by Anaxagoras in all bodies; being determinate numbers of such similar principles as, when they came to be parts, e. gr. of an animal body, would there make such bodies and combinations as their nature required; viz. the fane-
HOMONOPAGIA, a word used by some medical authors for the head-ache.

HOMONYMIA, in Logic, an equivocation. See HOMONYM, &c.

HOMONYMON, Oμονομον, composed of ὄμο, similar, and the Ionic ων, for om, a name, a word which has different meanings, or which is used to express things of different nature and quality.

Homozygous are the same with what are otherwise called polyzygous, homoeozemus, and equivocals.

HOMOGENEANS, Homogeneans, Homogeniandists. Homogeny, formed of ὄμογεν, or ὄμογενος, signifying of the same substance, are names which the Arians anciently gave to the orthodox, because they held that God the Son is homozygous, i.e. con-substantial with the Father. Humerius, king of the Vandals, who was an Arian, published a refert, directed to all the Homoeonian bishops. See Person, &c.

HOMOGENEOUS, Oμογενος, among Divines, a being of the same substance or essence with another.

The divinity of Christ being denied by the Ebonitians and Cerinthians in the first century, by the Theodotians in the second, by the Armenians at the beginning of the third, and by the Samosatians, or Pauliana, towards the close of the same, a council was assembled at Antioch in 250, wherein Paulus Samosatensis, head of this last sect, and bishop of Antioch, was condemned and deposed, and a decree published, as some have said, wherein Christ is asserted to be God of God, and ὄμογενος, i.e. con-substantial with the Father.

It has been urged by several ancient writers of the fourth century, viz. Athanasius, Hilary of Poictiers, and Basil, that the council of Antioch rejected the word ὄμογενος, or ὄμογεναι, as improper: and if we consider that Eusebius, who has been called an Arian, speaks of Malchion, who directed and governed at this council, as a man of uncommon soundness in the faith of Christ, we may presume that the term was not introduced in this council. The council of Nice, however, assembled in 325, expressly established the Homoeonian doctrine. Many learned writers have taken pains to vindicate the orthodoxy of the council of Antioch, and to show that both these councils held the same doctrine. See Aryan.

HOMOPHAGI. See OXOPHAGI.

HOMOPHONI, in the Ancient Greek Muses, implied uniform, contrasted with Antiphoni, which meant symphonies, or music in octaves. The word is derived from ὄμος, alike, and όνωι, found.

HOMOPHONI, Homophonous, in Greek Muses, was equivalent to uniform, or uniformon performance vocal or instrumental, in which the several parts were of the same pitch.

HOMORAN, or HOMAN, in Geography, a town of Arabia, in the province of Yemen; between Sana and Beit al-Fakah. In a hill in the vicinity of this town, there are laid to be 350 refineries for water, cut in the rock. In its district is comprehended a large and fertile mountain, called Burra.

HOMORIUS, in Mythology, is an epitome given to Jupiter by the Greeks, answering to Termas in the Romans. Polyb. Hyl. Lib. ii.

HOMOROD, in Geography, a town of Tranislavia; 15 miles N. of Pogaras.

HOMOTOMOS, in Medicine, an epithet given to Jupiter by the Greeks, answering to Terminatus among the Romans. Polyb. Hyl. Lib. ii.

HOMUNCULUS, in Anatomy, by which is signified a certain kind of fever, which continue from the beginning to the end in one equable and uniform tenor, without exacerbation or relaxation.

HOMS, in Geography. See EMESA.

HOMUNCULARES, in Ecclesiastical History, an appellation given by the Arians to the orthodox, who said there were two natures and substance in Christ.

HOMUNCULISTS, Homunculists, formed of homunculus, a diminutive of homo, a man, q.d. little man, a feeble of heretics, the followers of Plotinus, and from him also called Plotinists.

They gave this appellation, because of their denying the two natures of Jesus Chrift, and holding that he was only mere man.

HOMUNCULITES, Homunculite, were a sect of ancient heretics, whose distinguished dogma it was, that the image of God was impressed on the body, not on the soul or mind of man.

HO-NAO, in Geography, a most delightful province of China, situated near the centre of the country, and called by the Chinese Tung-hoa, or the Middle Flower. It is bounded on the N. by the provinces of Pe-tcheli and Chan-fi, on the S. by Hon-quaung, and on the E. by that of Chan-tong. Its capital is Cap-fong. The ancient emperors, invited by the mildness of the climate and the beauty of the country, fixed their residence here for some time. The abundance of its fruits, pastures, and corn, the effect of rather more than 12000 leagues from the sea, and the quantity of the provisions, have prevented trade from flourishing in this, as it has done in other provinces of the empire. The whole country is flat, except towards the west, where ariseth a long chain of mountains, covered with thick forests; and the land is in such high state of cultivation, that those who travel through it imagine they are walking in an immense garden. Besides the river Hoang-ho, which traverses this province, it is watered by a great number of springs and fountains; it has also a valuable lake, which invites to its banks a prodigious number of workmen, because its water has the property of communicating to silk a lustrous, which cannot be imitated. Exclusively of forts, cities, and places of strength, this province contains eight fous, or cities of the first class, and 12 of the second and third. The population of this province, according to Sir George Staunton, amounts to 21,000,000 persons.

HO-NAN, a city of the first class in the fore-mentioned province, situated amid mountains and between three rivers. The Chinese formerly believed this city to be the centre of the earth, because it was the middle of their empire. Its jurisdiction is very extensive; for it comprehends one city of the second class, and 13 of the third. One of these cities named Teng-fong-hien, is famous on account of the tower erected by the celebrated Tcheou-kong for an observatory; in it is to be still seen an instrument which he made use of to find the shadow at noon, and to determine the latitude. This astronomer lived above 1000 years before the Christian era, and the Chinese pretend that he invented the mariner's compass. N. lat. 44° 44'. E. long. 112° 9'.

HONANELLA, a town of Hindooistan, in Sanore, on the Tungibedra; 15 miles E. of Sanore.

Gen. Ch. Cal. Perianthus inferior, of five coriaceous, linear leaves, hairy and coloured externally, deciduous. Cor. Petals five, oblong, obtuse, rather shorter than the calyx, deciduous. Nectaries very numerous, capillary, dilated at the top, resembling flaments, shorter than the petals, inserted into the receptacle. Stam. Filaments eight, rather longer than the nectaries, inserted into the receptacle, compressed, linear, slightly dilated at their base; anthers erect.
HOND, in Geography, a town of Hungary, 10 miles N.W. of Tokay.

HONDA, a town of America, in New Granada, situated on the river Magdalena, in N. lat. 5° 16', and long. E. of Quito 4° 5'. M. Bouguer represents it as a pleasant little town, and the chief mart of the commerce between Quito and the northern provinces.

Hovaxa, a bay on the N. coast of the island of Cuba; 70 miles W. of Havana. N. lat. 22° 58'. W. long. 83° 25'.—Alfo, a bay on the E. coast of the province of Honduras, northward of Cape Gracias a Dios.—Alfo, a bay on the coast of South America, in the province of St. Martha. N. lat. 12°. W. long. 71° 6'.

HONDEKOETER, GILDE, in Biography, born at Utrecht in 1538, imitated the style of composition, and the manner of colouring, of Roland Savery, and David Vinckenboorns. He studied after nature those views which he intended for his landscapes, and in general made an agreeable choice. The forms and leaves of his trees are more in the taste of Vinckenboorns than Savery; but they are well handled, and finely pencilled, though sometimes perhaps they are a little too brown, or too yellow.

He painted different kinds of fowl s with singular truth and exactness, and frequently filled his small landscapes with no other objects; but those he finished highly, and with great tranparency of colouring.

HONDEKOETER, GYSEBRECHT, born at Utrecht in 1613, was son of the preceding, from whom he learned design and colouring. The subjects he painted were, cocks, hens, ducks, and other domestick fowls, which he described in a lively and strong manner, giving his objects agreeable attitudes, and colouring them exactly after nature. The works of this master are very often injudiciously afered to his son, although the paintings of Gysebrecht are in every respect abundantly inferior to those of Melchior Hondekoeter.

HONDEKOETER, MELCHI, son of the preceding, was born at Utrecht, in 1646, and from his infancy was carefully trained up to the profession by his father. He chose the same subjects; but, in his manner of painting them, he surpassed not only his master, but even the best of his contemporaries, in a very high degree. Till he was seventeen years of age he practised under the direction of Gysebrecht and accustomed himself to paint several sorts of birds; but he was particularly pleased to represent cocks, hens, ducks, chickens, and peacocks, which he described in an elegant variety of actions and attitudes.

After the death of his father, which happened in 1653, he received some instructions from his uncle John Baptist Weenix; but his principal and best instructor was nature, which he studied with intense application, and that enabled him to give to every animal he painted that truth, such a degree of force, expression, and life, as seemed to equal nature itself; nor did any artift take more pains to study every point that might conduce to the perfection of his art. His pencil was wonderfully neat and delicate; his touch light, his colouring exceedingly natural, lively, and remarkably transparent; and the feathers of his fowls were expressed with such a swelling softness, as might readily and agreeably deceive the eye of any spectator.

It is reported, that he had trained up a cock to stand in any attitude he wanted to describe, and that it was his custom to place that creature near his easel; so that, at the motion of his hand, the bird would fix itself in the proper posture, and would continue in that particular position, without the smallest perceptible alteration, for several hours at a time.

The landscapes which he introduces as the back grounds of his pictures, are adapted with peculiar judgment and skill, and admirably finished; they harmonize with his subject, and always increase the force and the beauty of his principal objects. His touch was very fragular in imitating the natural plumage of the fowls he painted; which not only produced a charming effect, but also may prove serviceable to an intelligent observer, to assist him in determining which are the genuine pictures of this master, and which are imitations. The works of Hondekoeter are jutly in very great request and estimation, and they generally afford a large price; almost in proportion to their value. He died 1695, aged 59.

HOND-HABEND. See HAND-HABEND.

HONDIOUS, ABRAHAM, in Biography. This painter, who is well known in our kingdoms, was born at Rotterdam in 1638, according to the most authentic writers, though Defcamps fixes his birth in 1650, twelve years later. He appears to have been an universal master, painting, with equal readiness, landscapes, animals of all kinds, particularly dogs, paintings of wild animals, boars, deer, wolves, and foxes, as also conversations and fowls; but his favourite subjects were paintings.

His manner seems peculiar to himself; it was bold and free; and, except Rubens and Snyder, few masters have painted animals in a greater style, or with more spirit. There is certainly a great deal of fire in his compositions; but his colouring is often extravagant, and his drawing extremely incorrect. In general his pencilling was harsh, and he delighted in a fiery tint; yet some of his small pictures are very neatly finished. There is a great inequality as to the merit of the works of Hondius, some of them being in every respect abundantly superior to others; but there is scarce any matter whole compositions are so easily distinguishable as those of Hondius, by certain particularities in his touch, his taste of design, and his colouring.

Several of his pictures of dogs are much esteemed; and one especially is mentioned, in which he represented thirty different species of those animals, all being well designed, and every distinct animal being characterized with some peculiar air, action, expression, or attitude. As he was exceedingly harassed and tormented with the gout, the works of his latter time
time are more negligently executed than tho' which he
finished in his prime; and, therefore, they very much con-
tribute to lessen the reputation he had acquired by some of
his more studied and better finished performances.

His most capital picture is the burning of Troy, in which
there are a variety of figures, many of them well designed
and disposed with judgment. Houbraken also mentions a
candle-light of this master's hand, in which appeared a fine
opposition of light and shadow, and the figures were ex-
tremely well designed and well coloured. He died 1691,
aged 73.

HONDÖ, in Geography, a kingdom of Africa, in the
Sierra Leone country, bordering on Quóoa, between the Grain
Coast and the river Scherbo.

HONDTSCHOOTE, a town of France, in the de-
partment of the North, and chief place of a canton, in the district
of Bergues; 10 miles S. E. of Dunkirk. The place con-
ains 3,168, and the canton 11,194 inhabitants, on a terri-
tory of 136 kilometres, in eight communes.

HONDURAS, a province of the domain or kingdom of
Guatemala, in the Spanish dominions of North America,
bound on the N. by a bay of its own name, on the E. by
the Mosquito shore and Caribbean sea, on the S. by Nazi-
ragua, and on the W. by Guatemala and Vera Paz. The
extent of this province is reckoned about 390 miles from E.
to W., and 150 from N. to S. The country, which consists
of mountains, valleys, and plains, is watered by many rivers,
and the land is thus much enriched. It abounds with honey,
wax, cotton, fine wood, and particularly dyeing woods, and
has some gold and silver mines; the air is good except near
low grounds and morasses; the soil is fertile, and in many
parts produces Indian corn thrice in the year, together
with wheat, peas, &c. Its pastures are excellent, and it
furnishes all kinds of provisions. Its vineyards afford
grapes twice in the year; for immediately after the vintage,
the grapes are cut again; and the second grapes are ripe
before Christmas. For want of cultivation, many parts of
this rich country have become desert. Its chief towns are
Valladolid the capital, Truxillo, Omoa, Gracias à Dios, and
St. Jago. It derives its chief importance from those tracts
on the bay which furnish logwood. (See Bay of Hon-
duras.) The Mosquito Indians have entered into treaties
with the English, who carry on the trade of mahogany and
dyeing-woods.

HONDURAS, Bay of, a bay of the Caribbean sea, adjoin-
ing the province of the same, and situated between Cape Hon-
duras and Cape Catoche, the north-eastermost point of
Yucatan, in lat. 21° 14'. The country, adjacent to this bay,
is chiefly inhabited by the Mosquito Indians, who were for-
merly more numerous, but their population has been dimin-
hished by the prevalence of the small-pox. A nation, still
populous, has been fixed in the environs of Cape Gracias à
Dios. This consists of the Samboes, said to be the descendants
of the crew of a Guinea-ship, which was formerly wrecked in
these latitudes. Their complexion, their features, their
hair, and their propensities, will scarcely allow us to trace
them to any other origin. The first establishment of the
English in these regions was formed about the year 1730, at
the distance of 26 leagues from Cape Honduras. At the
distance of 54 leagues from this colony is Gracias à Dios,
the harbour of which, formed by an arm of the sea, is im-
mensé, and tolerably safe. It was near this famous cape
that the English fixed themselves, upon a navigable river,
the borders of which are very fertile. Seventy leagues be-
yond this, the people found at Bluefield some spacious
and fruitful plains, an accessible river, a convenient harbour,
and a rock which might be easily made impregnable. In
1769 the three factories did not employ more than 200
white men, as many mulattoes, and 900 slaves. Exclusively
of the males and other articles sent to Jamaica, they sent
this year to Europe 800,000 feet of mahogany, 200,000 pounds
weight of farfaparilla, and 10,000 pounds of tortoise-shell.
This commerce had been very much carried on by smugglers;
but in 1763 the liberty of selling logwood was secured to
Great Britain; however, she was not permitted to raise
forts, and was even obliged to destroy those which had been
built. The abbe Raynal observes, that the wood which

grows upon the dry soil at Campeachy, is much superior to
that which is cut in the marshes of Honduras; though the
latter-said wood was molt in use, because the price of
the former had for a long time past exceeded all bounds.
Captain Henderson has lately (viz. in 1809,) published
"An Account of the British Settlement of Honduras," the
result of his own observations and inquiries. The climate,
he says, is better than that of most of our West India
islands; the air being refreshed with regular sea-breezes at
all seasons, except during the early part of summer, viz. the
months of April, May, and June. The average heat is 30°.
The only settlement formed by the English, which de-
feres the appellation of a town, is called Balize, lying at
the mouth of a river of the same name; which contains about
200 houses, all built of wood, and raised on pillars eight or
ten feet from the ground. The houses and offices occupy
the first floor, and the dining and sleeping rooms are placed
on the second. Each house has, likewise, its upper and lower
piazzas, which form the coolest retreats in the building.
The river Balize is navigable above 200 miles up the coun-
try; and several of our settlers have proceeded to that dis-
tance in quest of wood. The bay of Honduras is sprinkled
with a great number of shoals, rocks, and cluffs of drowned
islands, which render the navigation dangerous, and which,
without skilful pilots, has occasioned many wrecks. The
danger is increased during the prevalence of the northerly
winds, when the weather is generally hazy, and the currents
are subject to the influence of the winds. The vicinity of
Honduras to several of the Spanish settlements renders it an
appropriate station for the introduction of our manufactures,
which has been hitherto subject to considerable impediments.
The industry of our settlers has been so exclusively directed
to the wood-trade, that agricultural cultivation has been ne-
glected; though the soil is admirably rich, and fitted to
produce either the sugar, coffee, and cotton of our West
India islands, or the rice and maize of the continent. The
fisheries might also be rendered very productive; that which
is most regarded is the turtle-fishery. Some few of the
turtle caught here find their way to London; but most of
them, especially the species called "Hawk's bill," which
yield the tortoise-shell, are consumed on the spot. The
country still remains almost wholly covered with wood.
The cutting of mahogany takes place twice in the course
of the year; viz. at Christmas and in autumn. The labour
is performed by negroes, each gang of whom has a "hunt-
man," whose business it is to search the woods and discover
the spot where the exertions of his fellow-labourers may be
most profitably employed. In order to effect his purpose,
he cuts his way through the woods, and climbs the tallest
trees, in order to survey the surrounding country. The
colour of the mahogany leaves aids his eye in tracing the most
abundant spot. The mahogany tree is cut about twelve
feet from the ground, the axe-man standing on a fag. The
trunk of the tree furnishes, of course, the wood of largest
dimensions; but for ornamental purposes the branches are
preferable, the grain in them being closer, and the veins more
variegated. As these trees are generally found separate and
Vol. XVIII.
differed, a mahogany-walk comprehends an extent of several miles. Their growth is rapid, but lets so that of the logwood-tree, which is said to attain maturity in five years. The trunks and branches are dragged to the riverside, put together in rafts, and floated to the coast. Most of the negroes employed here have been brought from Jamaica, or have accompanied their owners from the United States; no direct importation from Africa having taken place, they are subjected to much less labour than the slaves in our sugar colonies. The protection afforded by government to the Honduras trade, confides in a convoy being appointed from Jamaica twice in the year, viz., in January and July. The annual revenue of the settlement is about £500.

Of the aquatic species of birds around the bay of Honduras, the pelican and Cormorant are the most predominant, induced to resort thither for prey by the transparency of the sea on this coast. Swallows also appear in great numbers in the rainy season. They are observed to quit a body, as soon as the dawn appears, the Savannah, in which they have rested during the night, and to ascend into the air in a compact spiral form, like a water-fouquet or column of smoke. Having attained a certain height they disperse in quest of food, which forms the occupation of the day. At sun-set their descent takes place in the same manner, with inconceivable rapidity, and with a noise which can be compared only to the rushing of a blast or the fall of a torrent. On the Mosquito coast the flocks are so troublesome that the natives are obliged to quit their dwellings in certain feasons, and to pass their nights in little banks upon the water. These people seem to have arrived at that stage of savage society which belongs to the class of "small despots." All the affairs of domestic life are performed by women; the succession to the crown is hereditary; and the royal power is completely despotic, absorbing within itself the executive, the legislative, and the judicial functions. They manifest no trace of religion except the adoration of evil spirits; and they have among them neither physician nor lawyer, but abound in conjurers. Polygamy is freely allowed; but adultery is punished, though not capitally. They can support long abstinence from food, but they indulge in the customary excesses of savages when they get possession of provisions, continuing their repast day and night, except in the short intervals of sleep, until they have consumed their whole flock. The warriors of the Mosquito tribe may amount to the number of 15,000; and small as this force is, they are able to keep their inland neighbours, whose manners are much ruder, in a state of dependence. The Mosquitoes have an hereditary avenion to the Spaniards, and profess great attachment to our countrymen.

**Honduras, Cape,** called also Punta de Capilla, a cape of North America, on the eastern side of the bay of Honduras. N. lat. 16°. W. long. 86° 16'.

**Honduras, Sea of,** is that part of the North sea bounded N. by the island of Cuba, S. by the Mosquito shore, S.W. by the bay of Honduras, W. by the peninsula of Yucatan, N.W. by the gulf of Mexico, E. by the bay of Honduras, and the Caribbean sea.

**Honduras, a town of the island of Cuba,** 63 miles N.E. of Bayamo. N. lat. 21° 21'. W. long. 76° 4'.

**Hone, Nathaniel,** in *Biography,* a portrait painter, was practised in London, with considerable reputation, in oil and miniature, and more particularly in enamel. He was the son of those artists who were created members of the Royal Academy at its foundation. He died in 1784.

**Hone, Cape,** in *Geography,* a cape on the coast of Algiers, called by the natives "Ras Hamunus," and by the ancients "Promontorium Magnum," situated, according to Dr. Shaw, in N. lat. 35° 25'. W. long. 1° 0'.

**Hone Key,** a small island in the Spanish main, at the entrance of Bluefield's bay. N. lat. 11° 30'. W. long. 83° 14'.

**Hone, a fine fort of whet-flone, used for setting razors, pen-knives, &c. (See Whet-flone.) This is the eos novaeculi of Linnaeus, with small gritty particles. See Cos Novaeculi and Onis-flone.**

It is of a yellowish colour, and is vulgarly, but erroneously, supposed to be hollywood petrified or changed into flone, by lying in a petrifying water for a certain seasion. Of these waters there are laid to be some in Oxfordshire, that will thus petrify in a very short time.

A fort of hones is dug near Drogheda in Ireland: some have described these as petrified wood, from the vicinity of Lough Neagh.

At Woodthorp, Codnor upper park, and other iron-flone mines in Derbyshire, thin beds of iron-flone are found in the hinds belonging to the coal-measures, which make pretty good hones when cut and ground to a face. See Farcet's Derbyshire Report, vol. i.

**Hones, lid of, or Hone-furnace,** is one of the tools used in the operation of grinding Specula for telescopes. This is formed of pieces of the finest blue hene or whet-flone, which are nearly of the same breadth and thickness, and which, when whetted, are made even and uniform in their colour and grain. These pieces are to be cut into square bits, and having ground one side of each concave on the convex marble, to which they are to be applied, with emery or fine sand, they are to be cemented upon this thick round piece of marble in a kind of pavement, leaving a space of a small fraw's breadth between each, and placing their grain in an alternate direction. Mr. Mudge, instead of marble, uses metal made of lead and tin, on which the hones are to be so disposed that the lines between them may run straight from one side to the other; and by this disposition, the teeth of a fine faw, moved along each of the divisions, will clear away the cement which rises between the hones. This bed of hones should be at least a fourth part larger than the metal which is to be ground upon it. The surface of the metal, upon which it is to be cemented, may or may not, at the pleasure of the workman, be turned of a convexity suitable to the gage. As soon as the hones are cemented down, and the joints cleared by the faw, the tool must be fixed in the lathe, and turned as exactly true to the gage as possible. By this instrument the sperical figure of the speculum is completed, and its surface rendered fit for the polisher. See Plate VI. Optics, fig. 2. Smith's optics, book iii. chap. ii. art. 791. Phil. Trans. vol. lxxv. part i. p. 327. See Grinding.

**Hone-court, in Botany.** See Stolon.

**Honesty.** See Lunaria.

**Honey, mel,** is a sweet vegetable juice, collected by the bee from the flowers of different plants, and deposited in the cells of the combs. See Bee.

It has been long known, that the bees collect their honey as well as their wax from the flowers of plants; but former writers had no distinct knowledge of the several parts of the flowers which furnish the inductive substances with two such different substances. It is now known that the honey is procured from those parts of the flowers which were first discovered by Linnaeus, and to which he has given the name of mellariae; these are certain vessels or glands situated near the basis of every petal, and continually secreting a nectarious or melleose juice. It is not yet ascertained from what part of the flower or plant the bees collect the wax; some have supposed that it is furnished by the farina contained in the apices of...
HONEY.

of the flowers; but N. Polhill, esq. an ingenious friend of the editor, of a whole extensive and accurate acquaintance with the economy of the bees has availed himself in articles pertaining to this subject, assures him that this is not the case; and that it is still undiscovered from whence they procure the wax. See Wax.

The bee feizes upon this part of the flower, and sucka from its honey, or a juice of that nature, which will become honey under her management. She receives this into her body, and carries it home to the hive, where she unloads herself by emptying it into the cells which were before prepared to receive it. The bee does not receive the honey in collecting it from the flowers into the body, by means of her trunk, as many have supposed; for this trunk serves only to collect the sweet juice, in small drops, from the nectaria of flowers. When the trunk is thus loaded with the juice or honey, it deposits it on the tongue, which is exerted for that purpose, and being drawn back into the mouth, conveys it into the oesophagus. The oesophagus of the bee is a long and slender canal, passing from the mouth into the thorax; towards its termination in that part it is dilated into a fort of bag, which forms the first stomach of the bee. Maraldi supposed the receptacle of the honey to be a bag, closed at the lower end, and only defined to receive the honey, and disgorge it again upon occasion; but Swammerdam, on a more accurate dissection of this insect, found it to be a real stomach, opening into another or second ventricle. The first stomach, when empty, is no more than a white filament, which, being hollow, is capable of receiving the honey; and, when received, it becomes swelled and dilated in proportion to the quantity it contains, and is very narrow at its lower part, where it is joined to the second stomach. This is a fort of white transparent bladder, and is usually much dilated, and so covered with large and broad circular muscles, that it seems to resemble a tub with many hoops. This stomach becomes again very slender and narrow at its lower end, where it is joined to the intestines. The second stomach and the intestines of the bee are often found to contain a great quantity of the farina; but the first stomach contains only honey, and is seen, by dissection, to be furnished with all the organs of contraction and dilatation which are necessary for throwing out its contents. When the honey has undergone a kind of concretion in the stomach, and is become much thicker than in its undigested state (though the gentleman already referred to apprehends that it undergoes no kind of change in the stomach of the bee), it is disgorge again through the mouth, and not as Swammerdam erroneously imagined, through a small orifice in the end of the trunk. The process of this operation may be easily discovered in glass tubes, where the cells reach to the glass, and have only four sides of wax, the glass forming for the other two sides.

The bee that comes loaded to the cell thrusts its head very deep into it, and discharges the honey from its stomach in a very little time, and seemingly with very little trouble, by the mouth. One bee succeeds another till the whole cell is filled. In this work, it has been often observed, that what appears to be the last quantity of honey digested into the cell is always of a different appearance from the rest: this is of the nature of a cream, and is always much thicker than the rest of the honey, which appears of one colour and consistence; it seems to be very useful in the economy of the work, serving at once to keep the honey moist, and to prevent its running out by any accident. Though this cream or crust appears to be the last voided quantity, it is not so in reality, for it seems to have been gathered together from the first, and every fresh quantity of honey is added under, not upon its surface. To this purpose it is always observed, that the bee which comes loaded to the cell does not at once discharge its honey into it, but entering into the cell as deep as possible, it puts forward the anterior pair of legs, and with them pierces a hole through the crust or cream. While this hole is kept open by the feet, the bee disgorge the honey in large drops from the mouth; these, falling into the hole made by the feet, mix with the nectar below, and the bee, before it flies off, new-models the crust, and closes up the hole; and this is regularly done by every bee that contributes to the general store of the cell.

The several cells of the combs in every hive are differently filled with honey, and for different purposes: some is laid up for immediate consumption, on occasions of bad weather and the like accidents, or for the use of those bees that in good weather fly at home to work, and are not supplied in any other way by those which have been abroad collecting honey; and some is more carefully preserved and deftined for the support of the swarm in the winter. Wherever any cell is filled with honey, it is always closed up, and never opened again, till all the honey in the cells which were not full is expended. The manner in which the bees make the lids or covers of the cells is this: they form a circle or ring of wax just within the verge of the cell; to this they add another such ring, and then another within that; and thus the aperture is rendered smaller and smaller, and by a continuance of the same operation is finally closed, the lid being composed of a vast number of concentric circles. This covering is designed for preserving the enclosed honey in a state of proper consistence, for a winter store.

Honey has been supposed by many to be the only food of the bees who collect it; but this is evidently erroneous. The farina of flowers serves as food for young bees, whilst they are in the form of maggots, but it is not so certain whether the old bees eat it or not; after which honey is again thrown out of their mouths in form of wax, and used in the structure of their cells; but others absolutely deny this, because the farina of different flowers varies in colour, whereas the wax is uniformly white.

Honey and wax form so considerable an article in the riches of a kingdom, that M. Reaumur strongly recommended to the court of France, the encouragement of those who raise swarms of bees, by deducting something from their taxes in proportion to every hive of bees kept by them above a certain number. And as bees are so easily raised, and kept with so little expense and trouble, it is a wonder that they are not more generally propagated in the kingdom. One great means of preferring and multiplying the bees would be the abolishing of that barbarous as well as prejudicial custom, which has hitherto very generally prevailed, of destroying the whole hive of bees in order to save the honey. Reaumur's Hist. Inf. vol. x. p. 89, &c. See Hive.

Honey is an article from which the cottage laboureur frequently derives a very beneficial profit; and this would still be considerably larger, if greater care was taken to have a more abundant supply of flowers in or near the situations in which the bees are kept.

There are many circumstances necessary to the forming of good honey, such as a warm and clear air, a good state of health of the bees, and a quantity of aromatic and sweet flowers in the neigbourhood of their hives. Some naturalists suppose that honey is of a different colour, according to the difference of the flowers or plants from which the bees suck it. The ancients esteemed that of ilets and roses to be the best; and Strabo relates, that there is a kind of honey in Pontus which is a strong poison, being procured
by bees which feed upon aconite and hemlock. F. Lambert, however, affirms as the contrary, and affirms that to be the best honey in the world, on account of the great quantity of bauve that grows there. He adds, that there is another very white kind of honey, hard as sugar, which does not stick to the hands. At present, the honey of Narbo, in France, is held to excel all others, on account of the roemary which abounds there. Bees are uncommonly fond of the lime-tree, the privet, and phillyrea; and in Lithuania, there are large quantities of wild bees, who lodge in hollow trees in woods, and collect their honey chiefly from the lime; so that when the season happens to be unfavourable at the time of the blowing of the lime, it is succeeded by a scarcity of honey. However, it is not to be supposed, that the bee confines itself to one particular flower; nor does it appear that the honey collected from one kind of flower differs essentially from that which is the produce of another; the only difference being in the quantity, colour, or some slight flavour from the flower. Excellent honey has been produced where nothing grew but nettles and other weeds.

The honey taken out of the hives in the beginning of summer is preferable to that gathered in autumn, since the first is the season in which the bees are most vigorous, and the plants in their flowering state.

We have two kinds of honey, the cobite and yellow.

The cabites, mel album, called also virgin honey, is that deposited in clean new cells, which, when first formed, are of a pure white colour; but when the combs are old, especially if bees have been bred in them, they become foul and discoloured, and vitiate the honey lodged in them. New honey is nearly as fluid as water, by age it acquires a greater degree of confection, and the cold of winter frequently congeals it. The second kind, or mel flavum, is squeezed from the combs in a press, after having first softened them with a little water over the fire. There is also an intermediate sort of a yellowish white colour, drawn by expression, without fire. That which runs spontaneously is purer than the expressed; a quantity of the wax and other impurities being forced out along with it by the pressure, especially when the combs are previously heated. The best sort of honey is of a thick confection, easily and totally soluble in cold water, of a whitish colour, an agreeable smell, and a very pleasant taste.

Honey, exposed to a gentle heat, as that of a water-bath, becomes thin, and throws up to its surface its own impurities, together with the meal or flower sometimes fraudulently mingled with it, which may thus be separated by defumption, so as to leave the honey pure, and to form the mel defumatum or clarified honey. On continuing the heat, there rises a considerable quantity of aqueous fluid, impregnated with the fine smell of the honey; the impregnated peldealum, like the honey at first, diffuses both in water and in rectified spirit, and promotes the union of oily and reinosous substances with watery liquors. By treating the impregnated mafs with moist clay, as practised by the sugar-baker for purifying sugar from its unctuous treacle matter, the unctuous parts of honey may in like manner be separated, and its pure sweet matter obtained in the form of a solid, saline, white concrete.

The specific gravity of clarified honey has been fixed at 1.31; but the tenacity of medicated honeys in general is the more usual test of the proper confection. If a portion of it, when cold, be divided by the edge of a spoon, it ought to unite again very fluidly.

It is observed, that the boiling of honey, though it diffuses great part of its odorous matter, and thus proves in some cases injurious to it, is nevertheless in other cases of advantage. There are particular constitutions with which honey disagrees, and in which very small quantities occasion gripes, purging, and great disorders; but boiling deprives it of that quality which produces these effects. Neumann's Chem. by Lewis, p. 330. Lewis's Mat. Med. p. 376.

This juice is an useful sweet for medicinal as well as domestic purposes: it is more aperient and detergent than the simple sweet prepared from the sugar-cane; and particularly serviceable for promoting expectoration in disorders of the breast, and as an ingredient in cooling and detergent gargarims. For these and other similar intentions it is sometimes mixed with vinegar in the proportion of two pounds of clarified honey to one pint of the acetic acid, boiled down to a proper confluence in a glass vessel over a slow fire, and thus forms the oxymel simple of the shops; it is also impregnated with the virtues of different vegetables, by boiling it in the same manner with their juice or infusions, till the watery parts of the juice or infusion have exhaled and left the active matter incorporated with the honey. See Oxymel.

Honey contains a quantity of fixed air, and is antiseptic as well as aperient and diuretic. Sir John Pringle recommends one pound and a quarter to be taken regularly every week in cakes of the gravel, or when the kidneys are loaded with sand.

Honey is the basis of several compositions in pharmacy, though in this respect it is less used than formerly. Of honey, with the addition of roes or violet, mercurialis, &c. (see Oxymel), was made mel rofatum, mercurialis, helboratum, &c. There is also a mel fobliticum, or a preparation of squills; mel pajfolutum, made with raisins boiled in hot water; and mel anthofatum, made of roemary-flowers.

Rofe honey, mel roes, rofatum, or rofatum, is prepared by macerating four ounces of red roe petals dried in three pints of boiling water for six hours, and then straining, and afterwards adding five pounds of clarified honey to the strained liquor, and by means of a water-bath, boiling it closely down to a proper confluence.

Honey of borax, mel boracis, is prepared by mixing a dram of borate of soda powdered with an ounce of clarified honey. This combination is usefully employed as a diuretic in phthisical afflictions of the fauces.

Honey is also an ingredient in several drinks, as malmethaglin, &c.

The chemills also draw a water, a spirit, an oil, &c. from honey.

Mr. Lemery, in his analysis of honey, observes, that two pounds of fine honey distilled in balneo Marius, afford six ounces of clear water of an infipid tate and of the smell of honey; this is commonly called the dew of honey. A larger quantity of phlegm may be procured by continuing the distillation, but it becomes foul. This liquor, though infipid to the taste, yet contains a latent acid, for it reddens the turnsole; but it neither ferments with the volatile nor fixed alkalies. The cucurbit being now placed in the sand heat, there come over four ounces of a yellowish pelucid water of an acrid tate, of a strong smell of honey, and somewhat empyreumatic; this liquor reddens the turnsole colour more than the former. The fire being increaced, there arise white clouds, which fill the head of the cucurbit and the receiver, and these finally condense into a third liquid, which is called the spirit of honey. This will be about three ounces in quantity, and of a red colour and empyreumatic smell, yet with an agreeable flavour, and of
HONEY.

an acid and burning tafe. This is a stronger acid than either of the former, and ferments with an alkali.

The fire being again increafed, more clouds arife, and, in fine, there is a fourth liquor produced; this is in quantity about two ounces, of an orange colour, and of an acid tafe, but less acid than the third liquor; as it contains more oil, which softens and sweetens it. Like the former, it ferments with alkalies, and reddens the colour of turfsols.

When the distillation is thus finished, there will remain in the cucurbitt fifteen ounces and a half of a light fpungy black coal. (Mem. Acad. Par. 1765.) This is to be then put under a retort for a fresh distillation, and a strong fire under this veft will raffe from it feven ounces of a reddifh brown liquor, which dafen the fingers to an orange colour, of a burnt fmal!, yet with fomething agreeable in it, and of an acid and very acid pungent tafe. Besides this, there come over two drams of a thick black oil, looking like tar; this alfo was of an acid tafe, which was owing to fome of the fafts of the honey being blended with it. There is much more oil contained in the hony, but it does not come over separate but blended with the other liquors; and after they have ftood fome days precipitates itself from them, and is found sticking to the fides and bottom of the veft. The matter remaining in the retort is about feven ounces of a black coal, of a light fpungy texture, and of a tafe almost infipid, and only femeing to contain a little falt. We fee by this process, that thirty-two ounces of hony yield twenty-four ounces and two drams of liquor, that being the difference in weight, between the hony when first put in, and the laft caput mortuum. Twenty-two ounces and fix drams are the quantity here preferved of the feveral liquors, the reft having efcapea through the junctures of the vefts, as will always be the cafe in fuch diftillations. Id. ibid.

The caput mortuum of this, and feveral other diftillations of hony, the whole making three pounds and a half, were put into an unglazed earthen pot, and calcined over the fire for ten hours; this readily took fire like common charcoal, and burnt till it loft ten ounces in weight, but without falling into ashes. The remaining coal had then a more faline tafe than before. Any acid liquor poured upon this fermen- tated, as with the common alkalies; and when thrown into water to make a lixivium, it bubbled in the manner of quick-lime thrown into water; and in the common way of making the lixivial fafts, this yielded a dram and a half of an acid alkaline one.

It is remarkable, that the calcined caput mortuum of hony contains, like other vegetable aliches, true particles of iron, which adhere to a knife touched with a magnet.

Honey, Wild. St. Adamant, abbot of Hue, in his de- fincription of the holy places, observes, that in the place where St. John the Baptist lived in the Eufcal, there are locufs which the poor people boil with oil, and a fort of herbs with large, long leaves of a milk colour, and a tafe like that of hony; and that this is what in scripture is called wild hony. Honey of Refers. See Rose, and Hony, sapra.

Honey-comb, a waxen structure, full of cells, framed by the bees to deposit their hony, eggs, &c. in.

The construction of the honey-comb feems one of the most surprifing parts of the work of insects, and the ma- terials of which it is compofed, which though evidently collect-
ed from flowers of plants, yet do not, that we know of, exile in them in that form, have given great caufe of speculation to the curious. The regular ftructure of the comb is also equally wonderful. When the several cells in it are exam- ined, it fhould feem that the nicef rules of geometry had been confulted for its composition, and all the advantages that could be wished or defired in a thing of that kind are evidently found in it.

The bees, in the ftructure of this receptacle of their hony, feem to have resolved a geometrical problem, far from an easy one, and indeed clogged with fo many conditions, that it might have puzzled able proficients in that science. This may be exprefTed in these words; a quantity of wax being given, to form it into a number of angular and equal cells, of a determinate capacity, but the greatest that can be made with that quantity of wax, and, at the fame time, that these cells shall be fo diptofed as to take up as little room as possible in the hive. In order to this feat condition, it is neceffary that the cells touch one another, in fuch a manner, that there be no angular space nor cavity between them. The bees have effected all this by making the cells all hexagonal, or tubes of fix equal fides; triangular, quadrangular, and some other figures; for the cells might have been indeed do diptofed between one another as to leave no space; but then an equal number of them could not be made with the fame quantity of wax. The body of the bee being rounded, it will also be received into an hexagonal cell, without leaving fuch large fafts as it muft if received into a triangular or fquare one.

The method of making two fets of cells in each comb, is also admirably contrived to fave the ex pense of wax, since, had they been made fingle, every comb muft have had its peculiar bafe, and every fet of cells their bottom of wax; whereas one bottom now ferves to two cells, and there is but one plate of wax in the centre of a double comb. There is, however, this farther difficulty attending it, that the feveral cells are not fo many hexagonal tubes with flat and broad bases, or tubes of an equal breadth all the way; but they are truly pointed at the bottom, being every one of them a hexagonal cell, with a pyramidal bafe, and forming that kind of figure, as Maraldi and Reinigmr firft discovered, which requires at leaft wax for containing the fame quantity of hony. Each of these bases is compofed of three equal rhombufes, and each bafe, in this manner, becomes the bafe of three other cells on the oppofite fide of the comb.

This is easily demonftrated to thofe who understand ge- ometry, by means of the feveral figures and positions of the oppofite fafts of the cells of the two fides of the comb; but the moft familiar explication of it to a common obferver, is to ftick three small pins through the bafe of any one cell, each in the centre of the rhomb that makes one fide of that bafe: if, after this, the comb be turned, the three pins will be found in the centres of three different cells of the oppofite fide.

The obfute angles of the three equal rhombufes that form the bafe, are found to be the doubles of an angle, (which often comes under confideration in questions relating to bafe angles) one, of which, the rules of geometry have been confulted for its composition, and all the advantages that could be wished or defired in a thing of that kind are evidently found in it.

The three equal angles of the three equal rhombufes that form the bafe, are found to be the doubles of an angle, (which often comes under confideration in questions relating to bafe angles) one, of which, the rules of geometry have been confulted for its composition, and all the advantages that could be wished or defired in a thing of that kind are evidently found in it.
plane, acute angles, which are the supplements of the former obtuse angles. Mons Maraldi found, by menuration, that the obtuse angles of the rhombuses were nearly 110°, and observed, that if they were fuppofed equal to each other, each of them must be 109° 28'; and Mr. Keong, by the method of infinitesimals, found, that this angle, in order to employ the lafit wax possible in a cell of the fame capacity, ought to be 109° 26'. Mr. Maclauren has also demonstrated, from the principles of common geometry, that the most advantageous angle is that which results from the fuppofed equality of the three plane angles forming the fold angle. We shall subfijion the demonstration for the fame of the mathematical reader.

Let GN and NM (Plate VIII. Geometry, fig. 98 and 99) represent any two adjoining fides of the hexagon, or the fecton of the cell perpendiculariy to its length. The fides of the cell are not complete parallelograms, as CGNK, BMNK, but trapezia, CGNE, BMNE, to which a rhombus CEB is fitted at OE, that has the oppofite point e in the apex of the figure; so that three rhombuses of this kind, with fix trapezia, may complete the figure of the cell. Let O be the centre of the hexagon, of which CK and KB are adjoining fides; join CB and KF interfeting in A; and, because COB is equal to CKB, and KBE equal to OC, the fold EBCK is equal to the foid BCO; whence it follows, that the fold content of the cell will be the fame, wherever the point E is taken in the right line KN, the points C, K, B, G, N, and M, being given. It is, therefore, neceffary to enquire, where the point E is to be taken in KN, fo that the area of the rhombus CEB, together with that of the two trapezia CGNE, ENMB, may form the lead superficies. Because E is perpendicular to BC in A, the area of the rhombus is AE X BC, and that of the trapezia CG + EK X KC; the fun of these is AE X BC + 2 KN X KC - KE X KC; and because 2 KN X KC is invariable, we are to enquire when AE X BC - KE X KC is a minimum.

Suppose the point L to be fon upon KN, that KL may be to AL as KC is to BC. From the centre A describe in the plane AKE, with the radius AE, an arc ER meeting AL, produced, if neceffary, in R: let EV be perpendicular to AR in V, and KH be perpendicular to the fame in H; then the triangles LEV, LKH, AKL, being familiar, we have LV = LE = LH, = KL = LA, are BC by the fuppofition, Hence, when E is between L and N, we have LH + LV (= VH) + KL + LE (= KE) = KC + BC, and when E is between K and L, we have LH = LV (= VH); LK = LE (= KE) - KC = BC; that is, in both cafes we have KE X KC = VH X BC; and consequently AE X BC - KE X KC = AE X BC - VH X BC = KE X KC = KE X KC = BS X BC = AH + VR X BC; which expression, because A and H and BC do not vary, is evidently lealt when VR vanishes, i.e., when E is upon L. Therefore CEBL is the rhombus of the most advantageous form in refeft of frugality, when KL is to AL as KC is to BC. But as OK is bifected in A, KC = OK = 4 AK, and AC = 3 AK, or BC = 2 AC = \sqrt{3} \times AK; consequently, KC, BC = 2 AK, and KL = AL = (KC + BC) = 1: \sqrt{3}; or AL = AK =: \sqrt{3}: \sqrt{2}; and (because AK/AC = 1: \sqrt{3}) AL/AC =: \sqrt{2}: \sqrt{2}; i.e., the angle CLA is that, whose tangent is to the radius as \sqrt{2} to 1, or as 14.142135 to 1000000; and therefore it is 54° 44' 8", and consequently the angle of the rhombus of the belt form is that of 109° 28' 16'.

By this folution it is only to estimate what faving is obtained by means of this construction.

If the bafe were flat, and not of the pyramid form above defcribed, there besides completing the parallelograms CBNK and BMNE, the surface of the bafe had should be 3 CB X AK; what they really do form amounts in surface to the fame parallelograms, and 3 CB X AH; the favings therefore amount to 3 CB X AK - AH

= 3 CB X AH \times \sqrt{3} - \sqrt{2} \times \sqrt{2},

which is almost a fourth part of the pains and expence of wax they below above what was neceffary for completing the parallelogram fides of the cells.

Mr. Maclauren has also demonstrated, that the plane angles CL, CIN, and BIL, which form the fold angle at L or the apex at J, are equal to each other; from which it is obvious, that the four acute, plane angles, which form the fold angle at C or D, are likewise mutually equal. It may be also added, that if the cells had been of any other form than hexagonal, and the bafes had still been pyramid, these must have been terminated by trapezia, and not by rhombuses, and therefore they would have been lea-regular, because OA and AK would have been unequal. Nor could there have been room for such an advantageous or fragil construction as that we have defcribed, because the fold content of the cell would have increafed with the right line KE. See Phil. Trans. vol. iv. p 2, &c.

This construction not only occasions a very great faving of the wax or matter of the comb; but besides this, there is another great advantage, which is, that the angles, refulting from this combination of the bafes, greatly strengthen the whole work.

The matter of which the comb is made, cloths the bees to much pains and labour in collecting, that it is no wonder they are careful and fparing of it in the work. The fides of the cells are all much thinner than the fmeet paper, and yet they are fo ftrengthened by their difpofition, that they are able to refit all the motions of the bee when within them, as they are very frequently obliged to be. The effect of their thriling their bodies into the cells, would be the burfting of thofe cells at the top, were not this well guarded againft. But to prevent this, the creatures extend a cord or roll of wax round the verge of every cell, in thofe manners, that it is fearedly possible they should split in that particular part. This cord or roll is at lead three times as thick as the fides of the cell, and is even much thicker and stronger at the angles of the cell than elsewhere; fo that the aperture of each cell is not regularly hexagonal, though its inner cavity be perfectly fo.

The bales of the cells are not always perfectly trilateral; sometimes, instead of the three rhombus they should be compos'd, of they conflit of four pieces, the bee having begun her work wrong; but then it is admirable to obferve, how nicely the two smaller pieces are afterwards joined, that the angle they make may be as nearly as possible equal to that of one of the rhombus, fo that the bafe of the cell still remains very nearly trilateral.

It would be a molt defirable thing to fee the bees at work in their making these elegant and regular fabrics; but it is fearedly possible for any thing of this kind difficultly, even with the advantages of glafs hives; for no bee ever works fingly on this occasion, but whenever the fabric is erecting, there are numbers together, all trying to affift one another; and their motions are fo swift, and fo bid by their handling before
HON

before one another, that very little is to be seen of them. New bees are every moment coming to the place, and old ones going away; and very frequently those which arrive late are dispatched away immediately after they arrive. There are only some very short moments in which the glafts of the hive can give a view of the creatures regularly employed in their work, for the moment that one sees a bee at work in building, that moment we see one either fly off, or some other bee get before her, so as to hinder the view.

These momentary lights, however, are sufficient to make it plain, that the bee uses her teeth in modelling and fashioning the wax. The sides of a cell is always received between the two teeth on this occasion, and by means of repeated blows on each side from each tooth, the sides is brought to a proper thinness, and the wax is by the same means wrought up to a proper consistence and firmness.

The celerity with which a swarm of bees received into a hive, where they find themselves lodged to their minds, bring their works of the combs to perfection, is amazing. In a week's time, when the weather favours, the half or two-thirds of a hive will be filled with combs. There are vast numbers at work all at once, and that they may not incommode one another, they do not work upon the first comb till it is finished; but when the foundation of that is laid, they go to work upon another; so that there are often the beginnings of three or four stories made at once, and so many swarms allotted to the carrying on the work of each.

The several combs are all placed parallel one to another, and hang perpendicularly from the top of the hive to the bottom; they begin each comb at the top or upper part of the hive, and carry it down to the floor, from side to side; and there is such a space left between them, that the bees can easily pass between: there are also holes made through the foundations of the several combs, by which they pass from the space that lies between one pair of combs and another. They often place a part of the combs in a contrary direction to the rest; so that while the others are placed horizontally, these stand perpendicular: there are also several other directions, in which they are disposed, which are easily accounted for from the nature of the place, and are always found to be the very belt that could be used for the occasion.

Though the sides of all the cells are extremely thin, yet the combs are very heavy when full of honey. This might endanger their breaking their hold, if not fastened from the top; and for this reason, the bees give them several additional supports in whatever place they can, often fastening them in many places one to another, and often fixing them to the sides of the edifice by large and solid lumps of wax.

It has generally been supposed that every bee of a swarm has its particular cell in some comb which was its own, and contained honey for its peculiar use; but the use of the glafts hives has shown us that all the cells are used in common. Reaumur, Hist. Inf. vol. ix. p. 282. vol. x. p. 21, &c.

Honey-comb, in Gunnery, is a flaw in the metal of a piece of ordnance, when it is ill cast and spongy.

Honey-comb-flone, in Natural History, the name given by many authors to a species of fossils, coral, which is usually found in large masses, and those full of large hexagonal cells, resembling those of a honey-comb. These are but lightly striated, and usually run deep into the fone.

Honey-comb-flone, or Lapis faginatus, is enumerated by Dr. Woodward in his Method of Fossils, and is mentioned by Dr. Plot as found in the north-east part of Staffordshire, which refer, it seems, to a species of coralline in the lime-flone rocks.

Honey-dew, a term frequently applied to a clammy secatcharine substance, which is often seen covering the leaves and other parts of different kinds of trees and plants, at some particular seasons of the year. It does not appear that the cause of this extraordinary appearance is yet fully understood, as it has not, by any means, been well ascertained, whether it derives its origin from external circumstances, or some morbid affection of the vegetables themselves. The author of Phytolegy appears to incline to the latter supposition, and conceives it to be an excretion from the parts of the plants which are affected with it. Indeed, it seems not improbable but that there may be some local arrangement in the parts of the plants which are covered with this licky material.

Gaffenus holds, that a viscid juice, transpiring out of the leaves, helps to compose this honey; or to convert the dew, falling on them, into a honey substance, which before had nothing of it: hence he accounts for the reason why we find it on some trees and not on others.

This honey-dew, falling on the cars and stalks of wheat, befriends them with a different colour from the natural; and, being of a clammy substance, fo binds up the young tender, and clove cars of the wheat, by the heat of the sun, that it prevents the growth and completing of the perfect grain therein.

Hops, when in flower, are subject to the dilateme called the honey-dew, which appears in the form of a meal, and is found by the microscope to contain the eggs of small insects, which fly about in swarms near the time when the hop is in flower, and gnaw the leaves and shoots. Several methods have been proposed for preventing the damage arising from this dew; particularly by surrounding the hop-hills with hot dung, or causing wood-ashes to be scattered with the wind over the hops at the time when the mealy dew falls. But the most effectual way of preventing its ill effects is to strip off the leaves, whereby the small insects contained in it perish at once, and before leaves spring forth, their secon of breeding is past.

A shower of rain, succeeding presently after the fall thereof, or the wind blowing swiftly, are the only natural remedies against it. See Aphid, Dew, Mildew, and Perforation of Plants.

HONFLEUR, a town of France, in the department of the Calvados, and chief place of a canton, in the district of Pont l'Evêque; seven miles N.N.E. of Pont l'Evêque. The place contains 9,600, and the canton 15,107 inhabitants, on a territory of 100 kilometres, in 16 communes. N. lat. 49° 29'. E. long. 0° 19'.

HONGI, a town of Austrian Poland, in Galicia; 30 miles W.S.W. of Halicz.

HONGILAX, a town of Sweden, in the government of Abo; 35 miles S. of Birnemborg.

HONG-TCHEOU, a town of the kingdom of Corea; 20 miles S.S.E. of Haimen.

HONG-TSE, a large lake of China, which discharges its waters into the Hoang; 60 miles from the sea.

HONHAY, a town of Bengal; nine miles S.E. of Ramgur.

HÔN-HOTOU, a lake of Chinese Tartary; 24 miles in circumference. N. lat. 48° 29'. E. long. 92° 46'.

HÔN foi guit gui prof, q. d. evil to fain that thinks evil; the motto of the most noble order of the knights of the Garter. See GARTER and MORTO.

HONIDA, in Geography, a town of Persia, in the province of Iraq; 45 miles E.N.E. of Gerdem.

HONIGELTZ, a town of Prussia, in Pomerelia; 15 miles S. of Marienburg.

HONIMAO, or ULSIASSER, one of the Molucca islands, about 9 miles long, and from 3 to 5 wide. The land is fertile, and its chief productions are rice and cloves. S. lat. 3° 30'. E. long. 129° 2'.

HONINGDAEL, a town of Norway, in the diocese of Drontheim; 80 miles S.W. of Komfeld.

HONITON, a borough, market town, and parish in the hundred of Axminster, and county of Devon, England. It confits principally of one broad handfome street, running from east to west, and another crofing it at right angles; through the former flows a small fream, from which the inhabitants are supplied by a dipping place opposite to almoft every door. The buildings are mostly modern; the town having fuffered considerabiy by fire at different times. In the year 1747, three-fourths of the houses were reduced to ashes, and a few hundreds of the labouring inhabitants thrown out of employ. In 1765, nearly 180 dwellings, and other buildings, were destroyed: another fire, in 1790, conflagrated 30 more; and a fourth, in 1797, the fame number, together with the bank. The town is now in a flate of great improvement; and the buildings are in general covered with slate: the number of houses returned, under the late act, was 577; the inhabitants 2377. The chief article of manufacture is broad lace, and edgings, of which considerable quantities are disposed of in the metropolis. The parish church is fttuated on an eminence at the ditance of about half a mile from the town. It was originally a faflal chapel for mendicant friars, but was enlarged about the year 1482, chiefly at the expense of Courtenay, bishop of Exeter; who also gave the curious fcreen which separates the chancel from the nave. The ancient parochial church is fuppofed to have flood in the town on the spot now occupied by Allhallow's chapel; which is a neat ftucco, with a square embattled tower of flint; and was erected by subscripition, in place of an older edifice, about the year 1755. Besides these places of religious worship, here are three meeting-houses for the respective denominations of Independents, Baptists, and Presbyterians. The education of the poorer classes is partly provided for in a small free-school for boys, and a school of industry for girls; the latter is supported by the subscription of females. This town possessed the privilege of a market previous to the reign of king John, by whole direétion the day on which it was held was changed from Sunday to Saturday. Honiton lends two members to parliament; but, though an ancient borough by prescription, it was only reprezentated prior to the time of Charles I.; the first return was made in the twenty-eighth year of Edward I. The right of election, which was formerly extended to every freeholder not receiving alms, is now veiled solely in the burgage holders paying feet and lot: the number of voters is about 350. The government of the town is under the direction of a portrewe and bailiff, who are annually chosen at the court of the lord of the manor. Honiton is 159 miles distant from London. Polywhele's History and Antiquities of Devonshire, fol.

HONNOCHETO LAKE, a lake of West Florida. N. lat. 31° 22'. W. long. 91° 27'.

HONOMINES, a river of America, in the N.W. territory, which runs S.E. into Puan bay. Between the head of this river and lake Superior is a short portage.

HONOPOLLOGAN, a town of the island of Ceylon; 55 miles N.N.W. of Paroofa.

HORAT, a small island in the Mediterranean, near the coast of France. N. lat. 43° 30'. E. long. 7° 2'.

HONORIACI, in Antiquity, a species or order of foliery under the eastern empire, who introduced the Gardens, Vandals, Alani, Suevi, &c., into Spain. Didymus and Verinius, two brothers, had, with great vigilance and valour, defended the paffages of the Pyrenees againfl the Barbarians, for some time, at their own expence; but being at length killed, the emperor Confiitans appointed the honoriaci to defend those paffages, who, not contented to lay them open to all the nations of the North, then ravaging the Gauls, joined themselves to them.

HONORIS RESPECTUM, Challenge proper, in Law. See CHALLENGE.

HONORIUS, emperor of the Weft, in Biography, second fon of the great Theodosius, was born in 384; obtained the title of Augustus, with his brother Arcadius, in 393, and succeeded to his portion of the empire at his father's death in 395. The reins of government were, during his minority, placed in the hands of the illuftrious general Stilicho, whose daughter he married in 398. As his character opened he appeared ill adapted to his high fation, and was addicted to puerile amufements, void alike of vigour and talents, and in every refept unfit to wield the fceptre of a mighty people. The times, however, wore a ferior affect; and the danger to which the empire was expofed required wifdom and fortitude. The revolt of the Goths, and an invasion of Italy by Alaric, with whom Stilicho had been obliged to make a kind of compromise, fo alarmed the young emperor, that in 403 he fled from his palace, and was for a time befieged by the Goths in a town of Liguria, in which he had taken fenle. His faithful general Stilicho came to his relieve, and, by the defeat of Alaric, freed Italy from present danger. The pageant prince was led to Rome, and had the honour of a triumph, to which, for the late time, there was an exhibition of the inhuman combats of gladiators. After this the emperor fixed the feat of empire at Ravenna; he conquered his enemies by his generals, being resolved never more to expofe his facred perfon to any rill; he fuffered himfelf to be governed by his minifters, who took advantage of their imperial master's indolence and infactivity. He died of a dropsy, in the 35th year of his age. Under Honorius and his brother the Roman power was di-
vided into two different empires. The successors of Honorius, who fixed their residence at Rome, were called emperors of the West, and the successors of Arcadius, who sat on the throne of Constantinople, were distinguished by the title of emperors of the Eastern Roman empire. Honorius was twice married, but left no issue. Gibbon. Univer. Hist.

Honorius I., pope, son of Petronius, a peron of consular dignity, was chosen to fill the Roman see on the death of Boniface V., in the year 625. The most remarkable circumstance in the life of this pope was, his having been induced to give his function to the opinion of the Monothelites, who maintained that in Christ there was only one will, one operation, for which he was solemnly condemned by the sixth general council, in the pontificate of pope Agatho. Some account of the facts Monothelites, and Monophysites, will be found under their respective articles. Honorius probably knew little about the matter, nor was able to attach any precipit and definite meaning to the expressions which he was led to make use of. He died in 638, after a reign of nearly thirteen years. He is greatly praised for having employed diligence and zeal in embellishing churches, and other consecrated places, with the most pompous and magnificent ornaments. Some of his letters are extant in the fifth volume of the "Collec. Concil." He is author of an epigram on the apolites looking up towards heaven with altnillement at the ascension of Christ, which is to be found in the twelfth volume of the Bibl. Patr. Moreri. Bower.

Honorius II., pope, whose original name was Lambert, was a native of the province of Bologna. Having embraced the ecleciastical life he was preferred by pope Paschal II. to the episcopal see of Vefeti, and afterwards translated to that of Otha. Upon the death of Calixtus in 1124, Honorius was elected to the popedom. Soon after his consecration he induced a sentence of excommunication against William, the son of Robert count of Normandy, for having married within the forbidden degree of consanguinity, and for having publicly burnt a letter sent to him by the pope's legate in which his marriage was declared null. On the death of the emperor Henry V., in the year 1125, Honorius sent his legates into Germany, to assist at the election of a new king, in whose presence Lotharius was anointed with the usual ceremonies. In the following year the pope succeeded in perfusing Henry I. of England to admit a legate into his kingdom, whose usurpations quickly provoked the spirited opposition of the clergy and laity. In 1127, upon the death of William, duke of Aquila, without leaving any issue, his uncle Roger, count of Sicily, passed over into Italy, and took possession of his nephew's dominions as his next heir. But Honorius having heard of his proceedings, pretended that the late duke had, by his last will, left his dominions, and whatever else he was possessed of, to St. Peter, and instantly denounced a sentence of excommunication against Roger. The question was disputed at the point of the sword, but the army of the prince prevailed against that of the pope, and his holiness was glad to grant him the investiture to the duchy. Honorius died in 1156. Twelve of his letters are preferred in the tenth volume of the Collec. Concil. Moreri. Bower.

Honorius III., pope, whose former name was Cencius Sabelli, was a descendant from an illustrious family, and a native of Rome, where he discharged several ecleciastical employments with great reputation, and was held in high respect for his learning and probity. In 1216, having already filled the posts of cardinal-deacon and cardinal-priest, he was unanimously elected pope. The first act of his pontificate was to send letters to all Christian princes to acquaint them with his promotion, and to exhort them to send succours, without delay, to the armies of the crusaders in the East. These succours was the object of his utmost solicitude; as was likewise the destruction of the Albigenes in France, which he enjoined the Catholics to attempt, by every method of persuasion, adapted to produce an effect on credulous or superstitious minds. In 1217, Henry, emperor of Constantinople, dying without issue, the princes of the crusades chose Peter, count of Auserre, his brother-in-law, for his successor, who, as soon as he heard of his election, left France, together with his wife, and repaired to Rome, where they were crowned by Honorius. In the year 1219, Reginald, king of the Isle of Man, at that time an independent kingdom, apprehensive that it might be invaded and subdued by the kings of England, resolved to engage the protection of the sovereign pontiff by surrendering himself a vassal of the apostolic see. He accordingly made a donation of the whole island to Honorius as nec of the Roman church, and afterwards received the investiture of it, upon binding himself and his heirs to pay a yearly hospital sum to the pope, and an acknowledgment of vassalage. From this time the pope was eager in the attempt to dispossess the inhabitants of the Hebridean land, and was particularly desirous of engaging in the cause the emperor Frederic II. But this prince excused himself from time to time by different plea, which his holiness was obliged to admit, till at length, in 1227, he died, after a pontificate of nearly eleven years. Honorius was a man of considerable learning for the age in which he lived, and was author of several works, of which there are still extant, "Sermons;" the "Life of Pope Celestine III.;" "A Statement of all the Revenues of the Roman Church;" and many others of less moment. Several of his letters are inserted in the eleventh volume of the Collec. Concil. Moreri. Bower.

Honorius IV., pope, who, before his elevation to the popedom, was called James Sabelli, or Savelli, was descended from the same family with Honorius III., and was created cardinal deacon by pope Urban VI. in 1261. In 1255 he was elected pope, as successor to Martin IV., and on this occasion he assumed the name of Honorius IV. He was so much afflicted with the gout, that he was unable to solemnize the masses in a proper manner, and only in a sitting posture; but he had a mind equal to all the difficulties of his situation. One of his earliest acts was to renew the anathemas which his predecessor had fulminated against Peter of Arragon, and by cauina a crusade to be preached against him in France, he raised a powerful army in that country, at the head of which king Philip entered Arragon, and gained a bloody victory over Peter. That prince died in a short time after the battle, and by his will devolved the kingdom of Arragon to his son Alphonus, and that of Sicily to his son James. Honorius no sooner heard of his death, and the distribution which he had made of his territories, than he issued his bull, commanding Alphonus to release, without delay, Charles, prince of Savelio, who had been taken prisoner by his father's fleet, and, at the same time, ordering James to quit the island of Sicily, and to deliver it up to Charles as the lawful heir. As those princes paid no regard to his holiness's bull, he excommunicated them, at three different times, in the year 1266, and laid the whole island of Sicily under an interdict. Honorius condemned and suppressed a new sect founded by Gerhard Sagarelli, who styled themselves "The Order of the Apostles," or "The Apostolic Brethren." But the objects apparently nearest the heart of Honorius were the extension of the papal power against all daring opponents, and the triumph of the crusaders over the infidels. His first attention was devoted to the former; and in sufficiency to it, he had projected a design of uniting all the Christian princes.
in a holy league against the two kings of Aragon and
Styly. While, however, he was wholly intent upon carrying
it into execution, he was cut off by death, in 1287, when he
had but just completed the second year of his pontificate.
He is said to have been eminent for wisdom, temperance,
and a sound discretion; and as a proof of his regard to the in-
terests of learning, he made provision for the establishment of
a college at Paris, for the study of the Oriental languages,
though he did not live to see the completion of such an in-
stitution. He confirmed the order of the hermits of St.
Augustine, and that of the Carmelites, which had been only
founded by the second council of Lyons. Some of his let-
ters are preserved. Moret, Bowcr.
HONOUR, among the Ancients, was worshipped as a
divinity, and had a temple erected to it, which had no entry
but through the temple of Virtue; in order to teach men
that true honour was only to be acquired by the practice of
virtue. In conformity to this wise maxim, Virtue was some-
times painted with wings, because she procured honour and
victory to those who studied her. Plutarch also observes to
the same purpose, that they sacrificed to Honour with the
head uncovered; it being usual to uncover upon meeting with
those who by their virtues have acquired honour in the
world; and we learn from Pliny, that Fab. Rutilianus was
the first who made a law, that on the 1st of July the Roman
knight's gold and silver cup rung on horsetback from the temple of
Honour to the capitol.
Honour is represented on many medals under the figure
of a man holding a pike, and sometimes an olive branch, in
the right hand, and a cornucopia in the other.
Belide its literal sense, wherein it denotes a testimony or
token of esteem or submission, honour is particularly applied
in our customs to the more noble kind of seignories, or lord-
ships, whereof other inferior lordships or manors hold or
defend. See SIEGLORY.
As a marquess confounds of several tenements, services, customs,
&c. to an honour contains divers manors, knights-fees, &c.
See Manor.
It was also formerly called beneficium, or royal fee, being
always held of the king in capite. Spelman.
Anciently honour was termed the same as laurea.
HONOUR, Counsellors of or Honorary Councilors, are such
as have a right to enter or sit in assemblies, courts, &c. to
deliberate or give judgment in the same, though they do not
regularly and properly belong to them.
The French call succursaux d'honneur, knights or gentlemen of
honour, the gentlemen riders of queens and princesses, who
attend them, give them their hand, &c. See Usur.
HONOUR, Court of. See COURT OF CHIVALRY.
HONOUR Courts are held within the honours, or seignories,
above-mentioned.
HONOUR, Maids of, are young ladies in the queen's house-
hold, whose office is to attend the queen when she goes
abroad, &c. In England they are six in number, and their
salaries £300. per annum each.
HONOUR, Pages of, are officers both of the king's and
queen's household, under the master of the hore. Of the
former there are four, whose annual salary is £26.1. each;
and of the latter two, with a salary of £15.1. each.
HONOUR of a Peer. See Peer.
HONOURS of the Lower, among the French, are certain
privileges annexed to divers dignities, or offices, particularly
those of duke, peer, chancellor, &c. as to enter the Louvre
in a coach, to have the tabouret, or flood, in the queen's pre-
fence, &c.
HONOURS of the Church are the rights belonging to the
patron, &c. as a seat and sepulchre in the chantry, to be first
ferved with the consecrated bread and wine, &c.
HONOURS of the City are the public offices or employments
thereof. He who has been constable, overeer of the poor,
and churchwarden of his parish; common-councilman, alderman,
and bailiff mayor; has paid all the honours of the city.
HONOURS of the House are certain ceremonies observed in
receiving visits, making entertainments, &c. performed either
by the master himself, or by some person appointed for that
purpose; as to go and receive the guests, to conduct them
out again, to see they be well seated, and, in short, to per-
form all the civilities and ceremonials of polite hospitality.
Honours are also applied to the principal part of the appar-
atus of great ceremonies; as coronations, consecrations,
christenings, &c. Such are the oil, tapes, &c.
In obsequies they anciently represented the honours, that is,
the shield, crest, sword, gauntlet, flaps, banner, horse,
&c.
HONOURS, Funerals are the ceremonies performed at the
interment of great men; as hangings, hearse, funeral har-
rangues, &c.
HONOURS, Military. All armies salute crowned heads
in the most respectful manner, colours and standards drop-
ping and officers saluting. Their guards pay no compliment
except to princes of the blood, and that by courtesy in the
absence of crowned heads.
A field-marshall is to be saluted with the colours and
standards of all the forces, except the horses and foot-guards,
and excepting when any of the royal family shall be present;
but in case a field-marshall is colonel of any regiment, or
troop of horses, or foot guards, he is to be saluted by the
colours or standards of the regiment or troop he com-
mands.
Generals of cavalry and infantry, upon all occasions,
are to have the march beat to them, and be saluted by all
officers, those bearing the colours excepted.
Lieutenant-generals of cavalry and infantry are, upon all
occasions, to be saluted by all officers. They are to have
three ruffles given them with presented arms.
Major-generals are to have two ruffles with presented
arms.
Brigadier-generals are to have one ruffle with presented
arms.
To colonels their own quarter-guards in camp turn out,
and present their arms, once a day, after which they only
turn out with ordered arms.
To majors their own guards turn out with ordered arms
once a day; at other times they stand by their arms.
When a lieutenant-colonel or major commands a regiment,
their own quarter-guards pay them the same compliment as
is ordered for the colonel.
The master-general of the ordnance is to have the same
respect and honours paid to him as the generals of horse and
foot.
HONOURS to be paid by the Cavalry.—A general of cavalry or
infantry is to receive with swords drawn, kettle-drums
beating, trumpets sounding the march, and all the officers
to salute, except the cornet bearing the standard.
A lieutenant-general is to receive with swords drawn,
trumpets sounding twice the trumpet flourish, as in drawing
swords, and all the officers to salute, except the cornet
bearing the standard; but the kettle-drums are not to beat.
A major-general is to receive with swords drawn, one
trumpet of each squadron sounding once the trumpet flourish,
as in drawing swords; no officer to salute, nor kettle-drum
to beat.
A brigadier-general is to be received with swords drawn; no trumpet to sound, nor any officer to salute, nor kettledrum to beat.

All officers in the command of forts or garrisons, have a right to the complimentary honours from the troops under their command, which are due to the rank one degree higher than the one they actually possess.

Manner of paying honours.—The king's standard, or colour in the guards, is never to be carried by any guard, except that which mounts on his majesty's person.

The first standard, guidon, or colour of regiments, which is the union colour, is not carried by any guard, but that on the king, queen, prince of Wales, or commander in chief, being of the royal family; and, except in those cases, it shall always remain with the regiment.

When general officers, or persons entitled to a salute, pass in the rear of a guard, the officer is only to make his men stand shoulder to shoulder, and not to face his guard to the right about, or beat his drum.

All fentiers are to pay a due respect to every officer who passes by their posts, but are to keep their proper front while paying the compliment.

All governors, whose commissions in the army are under the degree of general officers, shall have, in their own garrisons, all the guards turn out with reeded arms, and beat one ruffle; and though the main guard turns out with reeded arms every time he passes, yet they give him the compliment of the drum but once a day; but all the other guards beat as often as he appears near them.

If they are general officers likewise, they are then to have the further compliments paid them, by the several beatings of the drum, as practised in the army.

Regulation of honours to be paid to admirals.—Admirals, with their flags on the main-top, are to have the same respect from the troops as generals of cavalry and infantry; that is, upon all occasions to have a march beat to them, and to be saluted by all the officers, those bearing the colours excepted.

Vice-admirals are to have the same respect as lieutenant-generals of cavalry and infantry; that is, upon all occasions to be saluted by all the officers in the garrison, the drummers beating three ruffles.

The rear-admirals are to have the same respect as major-generals, who have two ruffles, and not to be saluted by any officer.

Commodores with broad pendants have the same respect as brigadier-generals; which is to have one ruffle.

Rank and precedence between sea and land officers.—The admiral, or commander-in-chief of his majesty's fleet, is to rank with a field-marshal of the army.

The admirals with their flags on the main-top-mast-head, are to have rank with generals.

Vice-admirals are to have rank as lieutenant-generals.

Rear-admirals are to have rank as major-generals.

Commodores with broad pendants are to have rank as brigadier generals.

Captains commanding post-ships, after three years from the date of their first commission for a post-ship, are to have rank as colonels.

All other captains commanding post-ships, are to have rank as lieutenant-colonels.

Captains of his majesty's ships or vessels, not taking part, are to have rank as majors.

Lieutenants of his majesty's ships are to have rank as captains.

The rank and precedence of sea-officers, in the classes above-mentioned, are to take place according to the seniority of their respective commissions.

Post-captains commanding ships or vessels that do not give part, rank only as majors during their commanding such vessels.

No land-officer is to command any of his majesty's squadrons or ships, nor any sea-officer to command at land; nor shall either have a right to demand military honours due to their respective ranks, unless they are upon actual service.

All guards and sentinels are to pay the same compliments to the officers of the royal navy, as are directed to be paid to the officers of the army, according to their relative ranks.

The compliments above directed are to be paid by the troops, to officers in the service of any power in alliance with his majesty, according to their respective ranks.

Turning out of the line.—The line turns out without arms, whenever any part of the royal family, or the general commanding in chief, comes along the front of the camp.

When the line turns out, the privates are to be drawn up in a line with the colours and standards; the corporals on the right and left of their respective companies, the pikemen form behind the colours, accounted, but without arms.

The officers and non-commissioned officers are to be drawn up with their respective companies. The field-officers in their proper posts in battalion, two ensigns taking hold of the colours.

When the commander-in-chief comes along the line, the camp-colours on the flanks of the parade are to be struck, and planted opposite to the belts of arms, and the drums piled up behind the colours; the halbarts are to be planted between, and on each side of the belts of arms, the hatchets turned from the colours. James.

Honour Point, in Heraldry, is that next above the centre of the escutcheon, dividing the upper part into two equal portions. See Point and Escutcheon.

Honour, Abatements of. See Abatement.

Honour, Additions of. (See Additions.) These additions are said to be nine in number; viz. a border, a quarter, a canton, a glyron, a file, a flanks, a lane, a vorder, and an escutcheon of pretence. (See each term respectively.) When additions of honour have been granted, fashion alone seems to have guided the choice of the particular ordinary. In the reign of king Henry VIII., the pile had the preference; and was granted by that king, as an augmentation of honour, to the lady Jane Seymour, and also to the lady Catharine Parr. But of late years, when the sovereign grants an augmentation to the arms of a subject, it hath been usual to place it either on a quarter, or on a canton. The diminution in which these ordinaries were anciently held, on account of their being occasionally granted as additions of honour, hath been considerably diminished, since it has been customary for any person of property, wanting and applying at the college for a coat of arms, not only to obtain a grant of arms, to himself and his heirs, on paying the fees, but to have the figures of any of the additions of honour, in chief he requests it, placed in the coat, although neither he nor any of his ancestors ever had any particular merit to title him to marks of the royal favour.

Honourable Amendments. Amendes honsrables. See Amend.

Honourable, or Honourable ordinations, in Heraldry. See Ordinary.

Honourary, or Honorary, is understood of a person who bears or possesses some quality or title, only for the name's sake, without doing any of the functions thereto belonging.
belonging, or receiving any of the advantages thereof. See Counsellors of Honour.

In the College of Physicians, London, are honourary fellows. The Royal Academy of Sciences at Paris formerly consisted of four classes of members, viz. honourary, penlonary, associates, and adjuncts. See Academy.

Honourary Freuds. See Fee and Discount.

Honourary Gifts. See Games.

Honourary Services are those incident to the tenure of

and commonly annexed to honour.

Honourary Tutor is a person of quality appointed to

who have an eye over the administration of the affairs of a minor,

while the onerary tutors have the real effective management

Honourary, Honourarium, is also used subhstantially for

a lawyer's fee, or a salary given to public professors of any

art or science.

HONRUBIA, in Geography, a town in Spain, in New Castile; 10 miles N.W. of Alarcon.

HONSORDF, a town of Prufia, in the palatinate of

and 27 miles N.E. of Culm.

HONTAN, L.A., Baron, in Biography, was born in Gaf-

cogny, and served in Canada, first as a soldier, then as an officer.

From Canada, he was sent to Newfoundland as king's

lieutenant, where he quarrelled with the governor, and was
cathcird.

He retired, first to Portugal, then to Denmark.

As an author he is known by "Voyages dans l'Amerique

Septentrionale," two volumes 12mo. in which we have an
account of the different tribes inhabiting North America,

their government, laws, customs, religion, &c.

HONTFONGENETHY, a thief taken hand-habend,

i.e. having the thing taken in hand.

HONTHORST, Gerard, in Biography, was born at

Utrecht in 1592, and was placed as a disciple with Abra-

ham Bloemart; but when he quitted that matter, he travelled

to Rome, and proceeded so happily in his studies as to be

accounted one of the best artists of his time. He continued

at Rome for several years, being employed by persons of

the first rank, and particularly by prince Julimini, for

whom he performed many considerable works.

His particular excellence was shown in his night-pieces,

representing figures by candle-light, which usually were as

large as life. Even Rubens professed himself an admirer of his

paintings in that style; and Sandart highly commends a picture of the Decollation of St. John by torch-light, which

he saw at Rome, in the church of Madonna della Scala. He

also mentions another in the Julimini gallery, of which the

subject is, Christ brought bound before Pilate, in a white

robe; and in that composition, the light proceeding from the

flame and torches produced so uncommon a lirure, and so

imbibed the effect, that no preceding artist had performed any

thing in that style that could be compared with it. Sandart

also observes, that Honthorst was as much distinguished,

while he resided at Rome, for his night-pieces in large, as

Elsheimer was for his manner of designing the fame subjects

in small.

Soon after his returning to his own country he visited Lon-

don, and obtained the favour of king Charles I. by several

grand performances and portraits; especially by one allego-

rical picture, in which he represented the portraits of the

king and queen, in the characters of two deities, and the

portrait of the duke of Buckingham in the character of

Mercury, introducing the liberal arts to that monarch and

his comfort. For that composition, which was well drawn

and extremely well coloured, the king presented him with

three thousand florins, a service of plate for twelve persons,

and a beautiful horse; and he had afterwards the honour to

instruct the queen of Bohemia, and the princesses her children,

in drawing.

His pencil is free and firm, and his colouring hath a great

deal of force, although it often is not pleasing, by a predo-

minancy of the yellow and brown tints; yet undoubtedly

Honthorst would have been an excellent painter, if he had

known how to give more grace, and more correctness to his

figures.

At his return from London to Holland, he adorned the

pleasure houses of the prince of Orange with many poetical

subjects, which he executed in fresco as well as in oil; but

he principally was employed in painting portraits, which are
described as having good expression, and extraordinary life

and force, by their broad masses of light being contrasted by

strong shadows. He died in 1661, aged 68.

Honthorst, William, brother to the preceding, was

born at Utrecht in 1604, and learned the art of painting

from Abraham Bloemart. The portraits which he painted

were very much esteemed, and in reality those were his most

commendable performances; for the historical subjests of his

hand, which generally were painted in a large size, are in no

degree equal to those of Gerard, either in respect of the

composition, the handling, or the colour, although they are

frequently told for the works of that master. He died in

1683, aged 79.

HONTHY, or Honddy, in Geography, a river of South

Wales, which runs into the Ulf, at Breemock.

HONTORIA de Valdecarballos, a town of Spain, in

Old Castile; 22 miles W. of Olmam.

HOOBARRE, a town of Africa, in the country of

Sahara; 332 miles S.W. of Moorzuok. N. lat. 27° 12' N.

E. long. 9° 25' W.

HOOD. See Chaperoo and Cecullus.

Hood, in Falconry, is a piece of leather, wherewith the

head of a hawk, falcon, or the like, is covered.

After feathering orewing the eyelds of a young hawk,

she is to be fitted with a large easy hood, which is to be taken

off and put on very often, watching her two nights, and

hanging her frequently and gently about the head. When

you perceive she has no aversion to the hood, unseal her in

the evening by candle-light, continuing to handle, hood, and

unhood her, as before, till at last she takes no offence, but

will patiently endure handling.

After unsealing, anoint with the finger and spittle the place

where the feeling thread is drawn through; then hood her,

and hold her on your fist.

As soon as she is well reigned, let her sit upon a perch;

but every night keep her on the fist three or four hours,
flocking, hooding, and unhooding, &c. And thus you may

do it in the day time, when the hath learnt to feed eagerly

and without fear.

Hood, on Ship-board, is a copper frame, made to go on

the top of the chimney, and to shitt as the wind does, that

the smoke may always fly to leeward.

Hood is also a fort of low wooden porch, placed over the

stair-case or ladder, which leads into the rearage or ap-

artments, where the crew generally reside in a merchant-ship.

The use of the hood is to admit air and light, and at the

same time to prevent the rain from falling into the rearage.

The wooden porch over the entrance or stair-case of the ma-

ter’s cabin is called companion.

Hood’s Bay, in Geography, a harbour on the W. coast

of Admiralty island, in Chatham Strait. N. lat. 57° 26' E. long.

22° 56'.

Hood’s island, an island in the Southern Pacific ocean,

the most northerly of the five Marquesas islands, discovered

discovered by captain Cook in April 1774.

and so called after the name
of the young gentleman by whom it was first seen; about 48 miles in circumference. It is called by the natives Téboa.
S. lat. 9° 26'. W. long. 13° 52'. See Marquesas.

Hoods, in Rural Economy, the names of the shades which heal or cover the hocks or hocks of corn.

Hooded Skates, another term employed to signify the same.

HOODED Milfoil, in Botany. See Utricularia.

HOODED Willow-herb. See Scutellaria.

HOODERS, a term given to the hood threes of corn

HOOFS, the horned part which covers the feet of divers animals, as horses, bullocks, &c.

The hoof serves much the same purposes as the nails of some animals and the claws of others.

The hoof of a horse surrounds the sole and the coffin-bone.

To be good, it should be of a dark colour, somewhat thinning, high, smooth, of a round shape, but a little larger below than above; short, that the horse may tread more on the toe than on the heel; and somewhat hollow within, having a narrow frust and broad heels.

The hoof should not have circles, which are a sign of its being brittle, and that the horse, being often shod, has had his feet spoiled by the many pieces broke out of it. A white hoof also is commonly brittle.

To judge whether the hoof be good and flanch, lift up the foot, and consider if it have a shoe forged purposely for it, and be very much pierced, and the holes made in the usual parts, as wanting horn enough to take hold by in those places where the nails are commonly driven. Sometimes they are forced to pierce the shoes nigh the heels, because the fore-part is bad; it being unusual to drive the nails near the heels, except the toe be too much split and broke as not to bear nails.

If the hoof be not round, but broad, and spreading out at the sides and quarters, the horse commonly has narrow heels, and, in time, will be flat-footed; which foot of foot is weak, and will not carry a shoe, nor travel far, but furbarate; add, that treading more on his heels than his toes, will cause him to go low on his patterns.

If the hoof be long, it will make him tread altogether on his heels. If crooked, viz. broad without and narrow within, so that the horse is fplay-footed, it will cause him to tread too much inward, and cut or interfere. If the frust be broad, the heels will be weak and soft. If the heel be narrow and tender, the horse will in time grow hoof-bound.

This sort of horned material, when ground or broken down in proper mills, has been found an extremely falling manure, and capable of affording large crops. See MANURE.

Hooft, Bones, is a round bony swelling, growing on the top of a horse’s hoof, which is always caustic by some blow or bruise. This is first to be rubbed and brought by purpura by digesting it with rotten litter, or hay boiled in itale urine, or with a plaster of itale wine-lees and wheatflour boiled together. When it is come to a head, let it be lanced with a thin hot iron, and put a tent into it made of turpentine, deer’s fat, and wax, boiled together in equal quantities, and lay a plaster of the same over the tent.

Hooft, Brittle, the name of an infirmity to which horses are subject. It comes sometimes naturally, and sometimes artificially. When it comes naturally, it is generally hereditary, the fire or dam having had the same complaint. When it comes on accidentally, it is sometimes owing to a difference falling down into the feet; sometimes to the creature’s being much mounded.

HOOF, the hoof, in this distemper, is so friable and rotten, as it were, that it cracks and falls off on every slight occasion. The cure is to be attempted in this manner: take wax, turpentine, faet, and hog’s lard, of each four ounces; fallad oil, half a pound; let the whole be melted together, and strained through a piece of canvas into a gallypot. The hoof is to be thoroughly anointed with this every day, morning and evening, especially at the root; and if there are any large cracks, they must be filled up at every dressing with a mixture of equal parts of cow-dung and hog’s lard.

The other infirmities to which hoofs are liable, are, the cutting of the hoof, hoof-bound, hoof-hard, hoof-hurt, hoof, fallo quarters, &c.

Hoof, Cutting of the. A horse is said to cut his hoof when the whole coffin of the hoof becomes loofened, and falls off from the bone. This may be remedied by care, and proper application; a new hoof being procurable, if the coffin bone, &c. be not hurt.

Horses sometime cut their hoofs, by reason of some prick, stib, foundering, furbarate, or other accident, that causes an impoilation in the foot; so that the hoof, and sometimes the coffin bone, being spongy and easily broken, fall off in large pieces. The left, when it happens, is a desperate case.

Hoof-bound, is a shrinking in of a horse’s hoof on the top and the heel, which makes the skin false above the hoof, and grow over the same.

It befits a horse divers ways, either by keeping him too dry in the stable, by straightforward, or by some unnatural heat after foundering.

Hoof-bone. In labouring beasts, especially oxen, if the hoof be not with a couter or share, it may be cured by a false of pitch and grease mixed with powder of brimstone, diffoluted together, and with a hot iron melted in the left of the hoof.

Hoof-bounded, is a distillation or dividing of the horn or coffin of a horse’s hoof from the flesh, at the setting on of the coronet.

If the parting be round about the coronet, it comes by means of foundering; if in part, then by a prick of some channel nail, quitter-bone, retreat, graveling, cloying, or the like. The signs of being loofened by foundering, is its breaking first in the fore part of the coronet, right against the toes; because the humour always defends towards the toe. If it proceeds from prickling, graveling, or the like, the hoof will loofen round about equally even at first. If occasioned by a quitter-bone, or hurt on the coronet, it will break right above the injured part, and rarely be seen to go any farther.

Hoof-faltered, is an infirmity that sometimes befits young horses, when they are over-rid or wrought hard, which makes them swell in that part, because of the blood falling down and setting there; which, if not speedily removed, will usually beget a wet fivain.

For the cure, take the strongest aquafortis, and first file or draw away the old hoof to a considerable degree with a file or drawing iron; then touch what is left of the hoof for three or four dressings with the aquafortis; anoint the foot with an ointment made of one pound of hogs grease, three quarters of a pound of patch grease, five ounces of Venice turpentine, three ounces of new wax, and three ounces of fallad oil, melted together over the fire: and thus a new hoof will be made to grow on the foot.

Hoofs, in Comparative Anatomy, are the hard and in-
HOOGVEEN, HENRY, a celebrated Dutch philologist, was born of parents in humble life at Leyden in 1712. He was sent to school at 10 years of age, when the severity of the master seemed to extenuate all his capacity for learning; but under a second tutor his powers expanded so rapidly, that at the age of 15 he was able to relieve his father from part of the expense of his education, by commencing a teacher of the lower classes. He after this followed the business of a schoolmaster at different places, and at Delft he ended his days in 1794. The works of this grammarian are, 1. An edition of "Vigeros de Iuctifinis Lingue Graecas," which has been frequently reprinted, the addition by Hoogveen being reckoned very valuable; 2. Poems, Orations, and other occasional Pieces; 3. "Doctrina Particularum Linguae Graecae," in two volumes 4to. 1769. This procured the author a very high reputation among all the votaries of Greek learning throughout Europe. An abridgment of it has been made by Schütz. Since the death of Hoogveen a posthumous work has been given to the world, entitled, "Dictionarium Analogicum Graecum." It was printed at the university press of Cambridge. Gen. Diog.

HOOGLEIDE, in Geography, a town of France, in the department of the Lys, and chief place of a canton, in the district of Ypres. The place contains 3529, and the canton 13,258 inhabitants, on a territory of 105 kilometres, in five communes.

HOOGLY, a circar or province of Bengal, about 80 miles in length from N. to S. and 48 in its medial breadth, much intersected, and formed into numerous islands by branches of the Hoogly and several other rivers — Alco, a small but ancient city of Bengal, on the same river with Calcutta, but on the opposite side, and about 26 miles above it. In the time of the Mahometan government, it was the "bunder" or port of the western arm of the Ganges, where the customs or duties on merchandise were collected. The French, Dutch, Danes, and Portuguese, have each of them had a town and factory on this part of the river, between Hoogly and Calcutta; and all within the extent of ten miles along the river. In 1757 this town was taken by the British, and vast quantities of salt and provisions belonging to the nabob of Bengal burned and delivered. N. int. 25 54'. E. long. 88 29'. — Alco, a river of Bengal, formed by the junction of the Cofimbazar and Jellingby, the two westermost branches of the Ganges, which runs into Bengal bay. This is the port of Calcutta, and the only branch of the Ganges which is commonly navigated by ships. The Cofimbazar river is almost dry from October to May; and the Jellingby river, (although a stream runs in it the whole year,) is in some
some years un navigable during two or three of the driest
months; so that the only subordinate branch of the Ganges,
that is at all times navigable, is the Chunindah river, which
separates at Maddapore, and terminates in the Hugli.
The Hoogly river, which is the most westerly branch of
the Ganges, has a much deeper outlet into the sea than the
principal branch. This may probably owe its existence to
its precipitating a less quantity of mud than the other; the
quantity of the Ganges water discharged here being less than
in the other, in the proportion of one to six. From the diffi-
culties that occur in navigating the entrance of the Hoogly
river, many are led to suppose that the channels are shallow.
The difficulties, however, arise from bringing the ships
acros some of the sand-banks, which project so far into the
sea, that the channels between them cannot easily be
traced from without. Rennell's Mem.

HOOGSTRATEN, a town of France, in the depart-
ment of the Two Nethes, and chief place of a canton,
in the district of Tourniout; 15 miles N. of Herentals.
The place contains 1362, and the canton 7277 inhabitants,
on a territory of 2021 square kilometers, in eight communes.

HOOK, in Angling, &c. See Fishing-book.

Hooks, in Building, &c. are of various sorts; some of
iron and others of brass, viz.
1. Armour-hooks, which are generally of brass,
and are laid up among arms, as guns, muskets, half-pikes, pikes, javelins, &c.
2. Cafemann-hooks.
3. Chimney-hooks, which are made both of brass
and iron, and of different fashions; their use is to fet the
hooks and fir-shovel along. 4. Curtain-hooks. 5. Hooks
for doors, gates, &c. 6. Double line-hooks, large and
small. 7. Single line-hooks, large and small. 8. Tenter-
hooks, of various sorts. See Tenter.

Hooks of a Ship, are all those forked timbers which
are placed directly upon the keel, as well in her run as in her
rake. See Dress-Boots.

Hooks, Boat, in a Ship. See Boat.

Hooks, Can, those which being made fast to the end of
a rope, with a noose (like that which brewers use to fling
or carry their barrels on), are made use of for flunging. See
Can-hook.

Hooks, Feet, in a Ship, the same with futtons.

Hookland, or Opeoland, land ploughed and tilled every

Hooks, Leof, in a Ship, a tackle with two hooks; one
to hitch into a cingle of the main or fore-fall, in the bot-
t rope at the keel of the fall by the crew; and the other is
to hitch into a flasp, which is spiked to the chefs-tree.

Their use is to pull down the fall, and fuccour the
tackles in a large fall and stiff gale, that all fhips may not
be heard upon the tack. It is also used when the tack is to be
feized more secure, and to take off or put on a bonnet or
drabler.

Hook-pins, in Architecture, are taper iron pins, only with
a hook-head, to pin the frame of a roof or floor together.

Hooks, Sher, in a Ship, hooks like sieckles fixed in the ends
of the yard-arms, that if a ship under fall come to board
her, those sieckles may cut her fhoords, and fo spoil her
tackling. But as those siecker-hooks are subject to break their
own yards, and cut the ropes that come from the top-falls,
they are now very seldom used.

Hooks, Trill. See Trill-hooks.

Hooks, Draught. See Draught-hooks.

HOOKAH, a pipe for smoking, used in India and
among the nation of the East; consisting of a glass-pot of
a globular form, nearly filled with water, which has
the two tubes, one perpendicular, on which the tobacco
is placed, and the other oblique from the side of the vessel, to
which the mouth is applied. The advantage of this con-
struction is, that the smoke, in passing through the water,
is cooled and rendered more agreeable. It consists of the
cylindrical pot, which is circulated from one to the other, but among
persons of superior rank and refinement, each person has a
hookah appropriate to himself, which is often made of silver
and set with precious stones; the tube, which is applied to
the mouth, is long and pliant, and on this account denomini-
ated the snake; and the vessel through which the smoke
passes is filled with rose water, and thus receives some of the
fragrant quality of that fluid. The preparation of the
hookah is the peculiar province of one of the domestics, and
the use of it is reckoned among the luxuries of the East.

HOODE, NATHANIEL, in Biography, author of a Roman
history, was a Roman Catholic by profession, and much
attached to the mystical doctrines taught by Fenelon. Few
biographical facts are known relating to this person. He is
said to have enjoyed the confidence and patronage of per-
sons distinguished as well by their virtue as their rank. He
appears to have lost the property which he possessed in the
fatal South-sea bubble. Not long after, he was recom-
mended to Sarah, duchess of Marlborough, as a proper per-
on to assist in compiling the memoirs of her own life, for
which literary service she presented him with the magnificent
sum of five thousand pounds. The book, entitled "An
Account of the Conduct of the Dukes of Marlborough,
from her first coming to Court to the Year 1715," was pub-
lished in 1732, but he quarrelled with Hooke soon after,
on account, as he affirmed, of his wish to convert her to
papery. The great work of Mr. Hooke was "The Ro-
man History," from its earliest periods to the settlement
of the empire under Octavius. It was published at first in
4 vols. 4to., but it has since been published in 8to., and a
new edition of it was given to the world a few weeks since,
in 11 vols. 8vo. Another work of this historian upon Ro-
man affairs, was "Observations on Four Pieces upon
the Roman Senate." He also published a translation of "Ram-

HOODE, ROBERT, an eminent mathematician, who flour-
rished in the 17th century, was born at Erehwater, in the
Isle of Wight, where his father was milliner, in the year
1655. The brightnes of his parts led his parents to intend
him for the church, but the weak state of health of the
child, and his being subject to almost perpetual head-ache,
made them despair of rendering their son a scholar. The
youth being, in a good measure, left to himself, and to the
best of his own genius, turned his attention to mechanics,
and employed himself in making toys, some of which dis-
covered much ingenuity. At length he made a clock
in wood, that would perform all the motions, and mark out in
a rough manner the hours of the day. He displayed a taste
like wise for drawing, and soon after the death of his father
he was placed under the celebrated painter Sir Peter Lely.
To the profession of painting he could not apply himself on
account of his health. He therefore was placed first in
Weinmünster school, and afterwards was sent to Oxford.
In 1665 he had made such progress in the sciences, that
he was elected a member of a philosophical society at Oxford,
and became an adherent to the honourable Mr. Boyle, in his
experiments and pursuits, to whom he was particularly use-
ful in the construction of the air-pump. He was, likewise,
an adept in astronomy, and constructed some instruments
well adapted to the making of observations. In 1662, Mr.
Hooke was appointed curator of experiments for the Royal
Society, which office he continued to hold during the whole
of his life. He was engaged to furnish the members, at every time of their meet-
ings, with two or three new experiments of his own, and in
1691,
pursue such others as they should recommend to him. This
benevolence led him to make several important discoveries
relating to the nature and properties of the air. In 1665,
when the Royal Society was established by charter, Mr.
Hooke was nominated one of the members who were ap-
pointed on the first council. The repository of the society
was committed to his care, and a gallery in the
Graham college was appointed for its reception. In the following
year he was made professor of mechanics to the Royal So-
ciety, by Sir John Cutler, with a salary of 50l. per annum
settled upon him for life, and in the same year he read a
tomical lectures at Graham college. He published, in 1665,
his "Micrographia, or Some Physiological Descriptions of
minute Bodies, made by Magnifying Glasses, &c."
This work he dedicated to the king, who had been instrumental
in founding the society, and who had thrown himself friendly
to experimental pursuits, for all which he is applauded by
Mr. Hooke in terms approaching to fulsome flattery.
The meetings of the society being now discontinued on account of
the ravages of the plague, Mr. Hooke, accompanied by
other persons, among whom was doctor, afterwards bishop,
Wilkings, and Sir W. Petty, retired to the seat of the earl of
Berkeley, where they diligently pursued their experiments,
an account of which they afterwards communicated to the
Royal Society when its meetings were resumed. After the
fire of London in 1666, Mr. Hooke offered to the court
of a plan for rebuilding the city, which, though
not followed, led to his appointment to the office of
one of the city surveyors, in which he acquired considerable
property. We shall not enter into the disputes and contro-
versies in which Mr. Hooke engaged, in some of which he
shewed a temper unworthy of a true philosopher. In 1673 he
proposed a "Theory of the Variation of the Compas," and
in the following year he published "An Attempt to prove
the Motion of the Earth from Observations;" his next publica-
tions were "A Description of Heliocopes, &c." and
"Descriptions of some mechanical Improvements of
Lamps and water-poles, together with physical and me-
chanical Discoveries." Upon the death of Mr. Oldenburgh,
Mr. Hooke was appointed to supply his place in the office
of secretary to the Royal Society; this was only a tem-
porary appointment, as the office was in a few months given
to Mr. Newmarch Grew. Mr. Hooke was not contented with
the reputation which he had acquired, though consider-
able, but on the publication of Sir Isaac Newton's Prin-
cipia, he laid claim to that great man's discovery concerning
the force and action of gravity, his pretensions to which
were most satisfactorily refuted. In 1691 he was employed
in forming the plan of the hospital near Hoxton, which was
founded by alderman Asle, who appointed archbishop Til-
loton one of his executors, and in the same year Mr.
Hooke was by that prelate created M. D. In 1696 the
Royal Society would gladly have employed him in a repeti-
tion of his experiments at their expense, but his ill state
of health prevented him from engaging in the business.
He died at his apartments in Graham college in 1702, in the
sixty-eighth year of his age. Several of his papers may be
seen in the Transactions of the Royal Society; and after his
death, in 1705, his posthumous works were published.
He was a man of great mechanical genius, and the sciences are
indebted to him for several improvements, and for instru-
ments adapted to the discovery of other new and useful
facts. He was well acquainted with the ancient languages,
and all the branches of the mathematics. He always main-
tained a great veneration for the Deity, and seldom received
any signal benefit in life, or made any valuable discovery in
nature, or invented any useful contrivance, or found out any
considerable problem, without expressing his gratitude to

HOOVER, John, a learned antiquary, was born at
Exeter in 1524, and educated at Oxford, after which he
travelled into Germany. Upon his return he was elected a
representative in parliament for his native city in 1572. He
wrote a description of Exeter, and was author of some part
of Holinghed's Chronicle, besides other pieces. He died in
1601.

Hooker, Richard, nephew of the above, was born at
Heavitree, near Exeter, in 1553; he was educated at the
grammar school of Exeter, from which place he was sent to
Corpus Christi college, Oxford, of which he was chosen
fellow in 1577. He was indebted to the patronage of bish-
op Jewel for a learned education, and calling once on the
prelate in his way to Oxford, the bishop gave him much
good advice and his benediction, but forgot to give him any
money; quickly, however, recollecting himself, he sent his
servant to call him back, and on his return he said, "Rich-
ard, I have sent for you to lend you a horse, which hath
committed me many a mile, and I thank God with much
care." He then gave him a walking staff, with which he had
himself travelled through many parts of Germany, and added,
"Richard, I do not give you ten groats to bear your
to the cost of his journey; but I have also,
and these talents and that excellent disposition which
Procured him other friends in Dr. Cole, then
president in his college, and Dr. Edwin Sandys, bishop of London,
by whose interest he was elected scholar of his college in
1573. At the same moment almost, the bishop placed his
own son under the care of Mr. Hooker for college instruc-
tion, though he had not at that time attained to his twentieth
year, but said Dr. Sandys, "I will have for my son a tutor
who may teach him learning by instruction, and virtue by
example, and my great end shall be the well." Mr.
Hooker, while at college, was greatly distinguished among
his contemporaries, for the piety, regularity, and exempli-
ring of his life. In 1577 he took his degree of M. A.,
and was in the same year elected fellow of his college.
In 1579 he was appointed deputy-professor of the Hebrew
tongue in the university, and for a cause, not known, but
which was probably of a very trifling nature, he and some
others were expelled the college by the vice-president, to
which they were again restored in the course of two or three
weeks. Mr. Hooker took orders in 1581, and very shortly
after was appointed to preach at St. Paul's Cross in Lon-
don. This appointment, which was esteemed an high ho-

OY

-
with another pupil, Mr. Cramer, a grand-nephew of the celebrated archbishop. The young man found their respects and very learned tutor tending a small flock of sheep, during the absence of his servant, called away to perform some domestic employment. When he was released from this duty, his friends accompanied him to the house, where they had the more serious mortification of witnessing the charnel-house of a wife, who took every opportunity of rendering one of the bed of men venerated by her captors and vacuous manner. They felt for the situation of their friend, and Mr. Cramer, before he left the house, expressed his surmise that he could possibly endure the miseries and inflicts to which he was subjected; to this Mr. Hooker replied, "My dear George, if saints have usually a double share in the miseries of this life, I thank none, ought not to repine at what my wife Creator hath appointed for me, but labour (as indeed I do) to submit mine to his will and profess my soul in peace." Upon the return of Mr. Sands, he prevailed on his father to obtain some better situation for Mr. Hooker, and he was, accordingly, by his interest, made master of the Temple. He soon found that London was not adapted to his mind; he loved a rural retirement, in order, as he said, "that he might see God's blessings spring out of the earth, and be free from noise and bustle, and eat that bread, which he might call his own, in privacy and quietness." He was, therefore, defers of engaging for a preferment for a man retired and tranquil mind, and the more so, as he had begun and had made some progress in his celebrated work "Of the Laws of Ecclesiastical Polity," which he found himself incapable of carrying on to his own satisfaction in the Temple. Upon making known his wishes to archbishop Whitgift, and apprising him of the undertaking on which he was employed, Mr. Hooker was presented, in 1591, to the rectory of Bofcomb, in Wilts; and in the same year he had other valuable preferments in the cathedral of Salisbury. At Bofcomb he finished four books of his great work, which were printed in 1594, and in the following year he was presented by the queen to the rectory of Bishop's Bourne, in Kent, where he resided the remainder of his life, discharging the duties of his office in the most exemplary and conciliatory manner. Here he finished his work, but he did not live to publish the sixth, seventh, and eighth books. Of this very year was written by Pope Clement VIII, said, "that there were in it such fests of eternity as will continue till the last fire shall devour all learning." In the year 1600, Mr. Hooker, in consequence of a cold that he caught on a passage by water between London and Gravesend, was afflicted with a long and very severe illness, which, in the end, proved fatal to him. He died in November of the same year, when he was only in the forty-seventh year of his age. His treatise on "Ecclesiastical Polity," procured for him a very great and extensive reputation both at home and abroad. When King James I. came out of Scotland, on his accession to the throne of England, he enquired of archbishop Whitgift for his friend Mr. Hooker, and being answered that he had died before the queen, who received the news of his death with great regret, he replied, "And I receive it with no joy, as I shall want the more desire of seeing and disquieting with that mind from whose book of church policy I have received such satisfaction. Indeed, my lord, I have received more satisfaction in reading a leaf or paragraph in Mr. Hooker, though it were but about the fashion of churches, or church-music, or the like, but especially of the sacraments, than I have had in the reading particular large treatises but of one of these subjects by others, though very learned men; and though many others write well, yet in the next age they will be forgotten; but, doublets, there is in every page of Mr. Hooker's book the picture of a divine soul, such pictures of truth and reason, and drawn in so favored colours, that they shall never fade, but give an immortal memory to the author." This work, so highly applauded by a pope, and a king, who confided himself to much wider and more learned in theology than all the popes, contains the most profound and ablest defence of ecclesiastical establishments that has ever appeared. "Bishop Tralman's Seal." Hooker is the name of a vessel built like a pine, but rigged and made like a barge, much used by the Dutch.

HOOKERIA, in Botany, so called by Mr. Smith, in honour of his friend Mr. William Jackson Hooker, F.L.S., a most affinious and intelligent botanist, celebrated as the discoverer of the Buschulani alpina in England, and particularly skilled in the knowledge of cryptogamic plants, especially Juntersmannia, with the reticulated habit of which that of the Hookeria accords. The interesting journal of a tour to Iceland, which Mr. Hooker has lately printed for the use of his friends, gives a foretaste of what the world may expect from his labours in a more promising and more extensive undertaking. Sm. Tr. of Linn. Soc. v. 9. p. 275.-Clats and order, Cryptogamia Hynia. Nat. Ord. Hynia.

Ten species are described in the Linncean Transactions, four of which, not previously figured, are there engraved. The only British one is

H. aster. Engl. Bot. t. 1922. (Hynnum helenium; Linn. Sp. Pl. 1585. Sin. H. Brit. 1295. Hedw. Fund. v. 11. t. 17. f. 4-6. H. pennata aquaticum leanes, longis ligulatis foliis; Dill. Mucic. 270. t. 13. f. 12.)—Leaves three-ranked, elliptical, uniform, entire, without ribs.—Found in moist shady situations, in various parts of England, especially in the northern counties, as well as in Germany and North America. Mr. Hooker gathered it on Holt Heath, Norfolk, in wet places among grass, bearing fruit in February. This is one of the most elegant of mosses, distinguished by its broad, pollicine, finely reticulated, succulent, pale green leaves, which stand upright, apparently in two rows, but nodally disposed in three; they sometimes take root at their blunt points. Stems stout, lateral, solitary, or in pairs, several others pointed, ribs flat. Flowers flaccid, 2-flowered solitary, erect, five times the length of the leaves, rather deep red and thinning, but bough at the base. Capsule more or less drooping, ovate, short, dark brown, thinning, all over most beautifully and regularly marked with dot-like reticulations, which by a mistake in the engraver of English Botany (for the drawing was correct), are represented like furrows only. Every other part of that plate, however, is correct. The singularly cellulose white cell, which falls off entirely, without splitting, is perhaps as good a mark of the genus as any. The lid is conical, as long as the capsule.

Among the exotic species the most remarkable for its habit is

H. pennata (Leikea pennata; Labillard. Nov. Holl. v. 2. 1667. t. 253. f. 1 Alpinogatum bulbosum; Hedw. Sp. Mucic. 43 t. 6. f. 1-5.)—Leaves three-ranked, somewhat pointed, finely serrated; the intermediate row obicular, half the length of the cell, which are lanceolate, and larger than the fruit-hulls.—Gathered by Mr. L. Bnshieré, and, Mr. R. Brown, in New Holland; at Dullay bay, New Zealand, by Mr. A. Menzies.—Larger than the foregoing, with creeping, densely tufted, black roots. Hedwig mistook them for bulbous ones, and seeing only half-tupe cap-
fakes, did not detect the fringe, which caused him to refer this mofs to his Antiquarian. Mr. Brown found his writ to agree with that of H. Lucas, which confirms the character of the genus. The simple fern-like form of the stem and flat leaves is peculiarly elegant. The height of the plant is from three to five inches.

The eight remaining species of Hesperia are quadrifaria, Tr. of Lin. Soc. v. 9. t. 23. f. 1. ; filicaulis, Hedw. Sp. Mf. t. 50; zamareifena, ibid. t. 51. f. 1. - 7; roblata, ibid. f. 8. - 13.; herbaeaeus, Tr. of Lin. Soc. v. 9. t. 23. f. 2.; Ar- kuselina, ibid. f. 2.; flexis, Hedw. Sp. Mf. t. 58.; and vascinata, Tr. of Lin. Soc. v. 9. t. 23. f. 4.

HOKETOWER, in Geography, a cape on the south of Ireland, at the extremity of a tongue of land in the county of Wexford, which forms the eastern side of Waterford harbour. On this cape is a light house. N. lat. 52° 6'. W. long. 6° 58'.

HOLLA, a town of Norway, in the diocese of Aggerhus; 32 miles N.W. of Christiania.

HOLDLACH, a town of Bengal; 21 miles S. of Calcutta.

HOOLE, CHARLES, in Biography, who flourished in the 17th century, was born at Wakefield, in Yorkshire, and educated at Lincoln college, Oxford, after which he became master of the free-school at Rotherham; but at the beginning of the civil wars he removed to London, where he gained great reputation as a school-master. He was author of many useful school books, an excellent edition of the Greek Testament, and a translation of TERENCE'S plays. He died in the year 1666.

HOOLE, JOHN, a very ingenious man, was born in London in 1727. His father was a watch-maker, and a very able mechanician. He gave his son a very good education, and obtained for him a clerkship in the India House. During his engagements in this situation he devoted his leisure hours to literary pursuits, particularly to the study of the Italian language, of which he acquired an extensive and very deep knowledge, as appears by his translations of Ariostello's Orlando Furioso, and Tasso's Jerusalem. He also published two volumes of the dramas of Metaphaste, and was author of three tragedies, three poems, and the life of Mr. Scott of Amwell. He died in the year 1803.

HOOLI, the name of a cheerful festival, celebrating the arrival of the vernal equinox, as the "Duffera," at the end of winter, is appropriated to the autumnal equinox. It is observed in honour of Narain, or the favourite god Kriifuna, of the Hindoo mythology, who is the Apollo of the Hindoos, the god of dance and music, of pleasure and of sport. This festival takes place the first full moon after the sun has passed the vernal equinox, and is calculated to hail the approach of spring. Its ceremonies consist entirely of the most frolicksome and playful sports. All ranks and ages mix in its celebration; and among other acts, during its continuance, cultivated at each other handful of a pulverized fern root, flower the jubia (towa Liane), and thin elastic balls, filled with a liquid coloured by the fame plant; these burst on the slightest resistance, and cover the whole drefs and perfon of him who is struck by it with a crimson stain. It is deemed no disgrace on this occasion to bear the most obvious traces of the deepest dye; for when once the barrier of the "Zen erea" (the apartments of the females), is broken down, the sovereign himself-serif aside his high delphin character, and unbinds in frohickome festivity Un- trained liberty of speech and repartee prevails; and the females of every family particularly delight in giving free indulgence to their comjoyg sports, which are equally kept up by the Mahometans and the Hindoos. Turner's Tibet, p. 144; &c.

HOOLSOVRY, in Geography, a town of Hindoostan, in Dowlatabad; 15 miles from Bawree.

HOOOLY-ONE, a town of Hindoostan, in the Mysore country, situated at the confluence of the Toom and the Badra, where they form the Tungbhadra; taken by the British troops in December, 1791; 56 miles N.W. of Seringapatam.

HOONGA-HAPAAR, and HOONGA-TONGA, small islands in the S. Pacific ocean, belonging to the group of Friendly islands; 30 miles N. of Tongataboo. S. lat. 25° 36', and 10 or 11 leagues from the W. point of Amamoo-ka. On the former live men reside, and the latter is uninhabited. Both abound with sea-fowl.

HOONLA, a town of Hindoostan, in the circuit of Cieacle; 11 miles W. of Ganjam.

HOOP, a town of Norway, in the government of Ward- hury; 76 miles W. of Wardhury.

HOOP, in Rural Economy, a name frequently applied to a high fort of cheese-vat, such as that used in making Stilton and other kinds of small rich cheeses. See Cheese and Dairying.

HOOP, in Agriculture, the name of a dry measure of grain, which is equivalent to a peck, or a quarter of a bushel. See Weights and Measures.

HOOP Wheel. See Detent-wheel.

HOOPER, EDMUND, in Biography, organist of Welf- minster Abbey, and a gentleman of the Chapel Royal, where he performed the duty of organist. He was one of the authors of the Psalms in four parts, published in 1594, and of several anthems in Barnard's Collection. His full anthems and services used to be performed in our provincial cathedrals within our own memory. He died July 14th, 1651.

HOOPER, JOHN, was born in Somerfeshire in 1455, and educated in Merton college, Oxford. He was for some time a member of the order of Cistercians, but having imbibed the principles of the reformers, he quitted a monastic life, and went to Swisserland, where he was married. On the ac- ception of Edward VI. he returned to England, and was made bishop of Glocester, to which he was added the bishopric of Worcester in commendam. Here he laboured with great zeal till the restoration of popery under Mary. Bishop Hooper was now thrown into prison, wherein the good old Latimer also was sent soon after. Here he was exceedingly ill treated, underwent a mock trial, and was condemned to the flames through the means of the infamous Gardiner. Though tried at the same time with Rogers, who was burnt at Smithfield, he was sent into his own diocese to be executed. This circumstance was intended to strike the greater terror into the breasts of those among whom he had laboured in the gospel ministry, but it was to the bishop a source of consolation, who rejoiced in giving testimony, by his death, to the doctrine which he had formerly preached. When he was chained to the stake, a flea was sent before him, on which was laid the queen's pardon if he would merit it by recanting his opinions. But he had made up his mind to the word that bigotry could inflict, and was prepared for the savage punishment to which he was sentenced. He suffered it in its full severity; the wood was green, and could not easily be kindled; his lower parts were literally consumed before his vitals were attacked. One of his hands dropped off; with the other he continued to exhibit his fortitude and pious resignation to the will of God. He was three quarters of an hour in torture, which he bore with inflexible con-
HOOPE, George, was born at Grimley, in Worcestershire, in the year 1640. He was educated at Wellesmead school, and from thence he was sent to Christ's college, Oxford in 1656. Here he distinguished himself by his talents and affiduous industry, and became very conversant in the knowledge of the mathematics and the ancient languages, including the oriental tongues, and particularly the Arabic. He took his degrees, and became chaplain first to Dr. Morley, bishop of Winchester, and then to Dr. Sheldon, archbishop of Canterbury. He was shortly after preferred with the rectory of Lambeth, and the precentorship of Exeter. In 1677 he took his degree of D.D. and was sent into Holland to attend the princes of Orange as her almoner. When he returned from the continent he was offered the professorship of divinity at Oxford, which he declined, and in 1680 was appointed chaplain to the king. Little more is known of him from this time till 1691, excepting that he was commissioned by James II. to attend the duke of Monmouth in the Tower, on the evening before his execution. In the year already mentioned, during the absence of king William in Holland, queen Mary, without any application on his part, promoted Dr. Hooper to the deanery of Canterbury. In 1701 he was chosen prior to the lower house of Convocation, and was offered the primacy of Ireland by the earl of Rochester, then lord lieutenant. In 1702 Dr. Hooper was promoted to the bishopric of St. Alban, in which see he continued only six months, when he was removed to the see of Bath and Wells. This change he very much objected to, and absolutely refused further promotion, though the bishopric of London and the archbishopric of York were succedingly offered him. It is said of him that he considered himself as married to his diocese, and he uniformly promoted his own clergy to all the influences of preferment that fell into his diocesan. He regarded no honor, but made those the objects of his favour who were most attentive to the duties of their situation. The care of his parishes was the best recommendation of a pastor to this vigilant prelate, and the continuance in his duty the most satisfactory requital that could be made him. Bishop Hooper died at Berkley, in Somersetshire, in 1727, having presided over his see nearly 25 years. He was author of a learned "Discourse on Lent," in two parts; the first, an Historical Account of its Observation; and the second, an Essay concerning its Original; of "A Calculation of the Credibility of human Testimony," published in the "Philosophical Transactions;" of "An Inquiry into the State of ancient Measures, with an Appendix concerning our Old English Money;" and various other works. They were all collected and printed at Oxford in 1757, in one volume folio. Gen. Bos. Hoope, in Ornithology, a name by which several have called the cygnus ferus, or wild swan. HOOPING COUGH, in Medicine. See Pertussis. HOOPOE, in Ornithology. See Upupa. HOORELL, in Geography, a town of Hindoostan, in Mewat; 24 miles N. of Dig. HOORINGOTTA, a river in Bengal, formed by the union of several others, which runs into the bay of Bengal. N. lat. 20° 50'. E. long. 90° 6'. HOORN, a sea-port town of Holland, situated on the Zuyder see. The town is fortified, as well as guarded by dams, has five gates, and contains some handsome buildings, churches, and hospitals. The adjacent land is very rich, and produces great quantities of butter and cheese, besides fattening lean cattle, brought hither from the more northern parts of Europe; 11 miles E. of Almenaer. N. lat. 52° 39'. E. long. 4° 54'. HOORN, or Hoxn, a town of France, in the department of the Lower Meuse, giving name to a small county in the bishopric of Liege; 3 miles W. of Rumigny. Also, a small island in a bay on the N. coast of New Guinea. S. lat. 3° 42'. E. long. 135° 42'. HOORN'S ISLAND, a small island at the E. entrance of the straits of Sunda. S. lat. 5° 44'. E. long. 106° 24'. HOORNBECK, John, in Biography, a learned Dutch Protestant, was born at Haarlem in 1517. He was divinity professor at Utrecht, and afterwards at Leyden, where he died in 1566. His application was very intense, and his learning various and solid. He understood many languages, both ancient and modern, as, the Latin, Greek, Hebrew, Chaldee, Syriac, Dutch, German, English, French, and Italian. He was author of very many works, which are enumerated by Bayle. He left two sons, of whom one, Isaac, was an eminent advocate at the Hague, and afterwards counsellor penitentiary, keeper of the seals, and fladholder of the fiefs of Holland and Well Friesland. Bayle. HOORNE, John Van, a distinguished anatomist and physician, was born at Amsterdam in 1621. After the completion of his grammar education he was sent to the university of Utrecht for the purpose of entering on the study of medicine, and went through his course with honour. With a view to further improvement he visited Italy; but on his arrival in that country he entered the Venetian army, in which he served for some time. Subsequently, however, his taste for science returned; and having studied under the most eminent professors of Italy he went to the universities of Basle, Montpellier, and Orleans, in the first of which he received the degree of M.D. with some very honourable testimonies of his abilities. In consequence of these he was appointed professor of anatomy and surgery at Amsterdam soon after his return; and in 1653 he was made professor of the same sciences in the university of Leyden, an appointment which he accepted with extreme pleasure, and which he fulfilled with much celebrity until his death, in January, 1670. Van Hoorne was a man of considerable literary attainments, being master of eight languages. His reputation with pollierness, however, rests principally on his anatomical knowledge. He had great reputation as a teacher of anatomy, and seems to have been the first to describe the thoracic duct in the human body, which Pecquet had already demonstrated in other animals. He is said to have been the first, likewise, to shew the intimate structure of the teats. He drew a great number of anatomical figures, with great elegance, which were never published, but which, according to Haller, were in the library of the celebrated Noehave, at Leyden. Besides having edited the works of Linnaeus, in 1656, and the book of Galen, "De Officij," with the commentaries of Vesalius, Sylvius, &c. in 1667, Van Hoorne...
was the author of several works, almost entirely relating to
anatomy, viz. 'Exercitationes Anatomicae I & II ad
Observationes Fallopii anatomicas,' &c. Liege, 1649, 4to; 
'Novus ductus chyliferum, nullum primum delineatus, de-
scriptus, et eruditorum examini propitious,' ibid. 1652; 
'Microcosmus, seu brevis manethio ad historiam corporis
humani in generi discipulorum,' ibid. 1662, and several
subsequent editions; 'Microtechnia, id est, brevifima
Chirurgia Methodus,' ibid. 1663, 1668, Lipsib, 1675; 
'Promotus Observationum funarum circa partes genitales'
in utroque I. His folios, Swamhram, "Miraculum
et curttores Novas thesese" was published by professor Pau, at
Leipzic, 1707, 8vo, with annotations. 'Eley. Dist. Hill.
HOOSACK, in Geography, a township of Ameria n, in
Renfelleer sherry, New York, opposite Bennington, in ver-
many, having 900 inhabitants.
HOOSICK, in Rural Economy, a term applied to an afection
of the lungs, which is often met with in cows, pigs, and some
other animals. In order to the removal of the complaint it has
been lately advised to have recourse to equal quantities of vin-
ager of aqua and balsam of copaiva, as one ounce of each,
adding double the same proportion of balsam of sulphur, and
four times as much honey, preparing it for one dose, by means
of a quart of penny-royal tea, and giving it to the beast imme-
diately, which should last two hours before, and as long after-
wards. It should be repeated every third day. Or, two ounces
of powdered elecampane root, one each of falt of wormwood
and powdered liquorice root, with the same quantity of the
sweet spirits of nitre, and half an ounce of sulphurated quin.
water, may be given in the same way as above, and re-
pealed every 24 hours.

While under these medicines, it is recommended that the
beef should be kept in the house, except in very fine weather,
and when the grass is quite dry. The drinking of cold water
should likewise be avoided.

HOOST, Peter Cornelius Van, in Biography, was
born at Amsterdam in 1581, of respectable parents, who
gave him a good education. He attached himself to writing
in his native language, and obtained the highest reputation
both in poetry and history, so that his works were consid-
ered as a model of style. His principal piece was the History
of the Low Countries, commencing with the reign of
Charles V, and reaching to 1588. This is much valued for
the accuracy of its political and military statements. It was
first printed at Amsterdam in 1642, and has been several
times reprinted. He was author likewise of a history of Henry
IV, written in the Latin language; and in it is given a re-
lation of the victory of the battle of Medici. His miscellaneous
works were printed in four volumes, comprising of epistles,
comedies, and poems. Hoost received the order of St.
Michael from Lewis XII. He died at the Hague in 1674.
Mowin.

HOP, in Botany. See Humulus and Lusus.

We have but one species of this genus, which is distin-
guished into the male and female hop.

The male hop grows wild by the side of hedges and upon
banks, in many parts of England. The young shoots of
these plants are often gathered by the poor people, and
boiled as an eclemt herb; but these must be taken when
young, otherwise they are tough and stringy. This is easily
distinguished by the flowers, which are small, and hang in
long loose bunches from the side of the stalk, abounding
with farina on their funnfits, and have no hops succeeding
to the flowers.

Hops were first brought into England from the Nether-
lands in the year 1524. (15 Hen. VIII.) But they were
known and used long before. They are first mentioned in
the English statute-book in the year 1552, viz. in the fifth
and sixth of Edw. VI. cap. 3. And by an act of parliament
of the first year of King James I anno 1603, cap. 18 it ap-
pears that hops were then produced in abundance in Eng-
land.

HOP, in Agriculture, the name commonly given to a well
known plant of the fibrous-rooted, perennial climbing kind,
which is chiefly grown for the use of the flower-bud, in af-
fording an agreeable aromatic bitter to beer, and other force
of malt liquor. There is only one species of this useful plant
in cultivation, but it has a number of varieties, which are
made use of in different circumstances and situations; such
as the red kind, the green kind, the white kind, and some
others. The first of these affords but a very small hop, yet,
from its hardy qualities and habits of growth, it is capable
of being employed with advantage in cold, exposed situations;
where the climate and soils are not so favourable as might be
wished, or improper for being planted with the other kinds.
It is considered by many as rendering the hop more effectually
than the other varieties, frequently flowing health and vigour
where the other sorts are greatly affected by the fly and the
boule, as well as less exposed during the leason of picking to
the injurious effects of the sun and rain.

The green-kind variety, although much less hardy in its
nature than the above sort, is a much more productive bearer,
and not unfrequently succeeds admirably in the medium de-
scriptions of hop-soils, even where the expoures are by no
means the most favourable. The white-kind fort, however,
which is still more tender and delicate in its habits, is in gen-
ereal held in the highest estimation by the hop planter,
in consequence of its being more early, and the produce of much
higher value in the market.

Hops are likewise frequently distinguished by the planters
under the names of the Flemish, the Canterbury, the Gold-
ings, the Farnham, and other similar titles. The Flemish
fort is commonly supposed the most inferior in its qualities,
being of the red-kind description. It is the female hop-
plant which affords the produce which is the object of the
planter. Where the male plant is met with, it should be
conifer removed, as of no utility.

As the different varieties of the hop become in a state of ma-
turity at different periods, and are proper for very different
kinds of soil, the planter should be careful that plants of the
several sorts be not intermixed, in setting them out, upon
the same plantation or hop-ground; as where there is an atten-
ation in this respect, it ceases much trouble in the culture of the
crop afterwards, especially in extensive concerns of this kind,
on account of the laborious of the labourers for getting on
sufficiently fast with the necessary work.

But where the different sorts are planted out in separate
plantations, this difficulty is wholly obviated, and the busines-
s of securing and preserving the crops rendered much more
careful and convenient in its accomplishment, by their becoming
in a state of maturity at different times.

Situation for Hop-grounds.—The most suitable situations
and expoures for the cultivation of hops are such as are
safely and gently to the south, or which are level, and have a good
exposure, but which have the benefit of being protected from the effects of the north and north-easterly winds
by some fort of fence or shelter, as those of high grounds
behind, &c. The plantations themselves should, however,
be pretty fine and open, as the plants rise to considerable heights, and should not be too much confined, but have a full circulation of air about them, and the perfect admission of light, as well as the influence of the sun; amongst them; as, by such means, the healthy vigour and growth of the plants may be not only promoted, but the too abundant moisture that hangs upon them be speedily dispersed, and thereby the crops rendered less liable to be injured by the effects of the light or heat, and the mists, to all of which they are much exposed. Situations contiguous to the seaside, or in marshy and sandy tracts that are level, are seldom suitable to the cultivation of the hop, as crops on them mostly miscarry in unfavourable seasons for such produce.

Soil and Preparations.—The sorts of land which are the most proper for the growth of this kind of plant, are all those of the more dry, strong, fertile, heavy, land, or clayey descriptions. They should have a disposition to drain, without being too destitute of a proper degree of moisture, and be possessed of a good depth of mould of the rich vegetable kind. Soils of the thin, gravelly, and chalky sorts are quite improper for the culture of this sort of crop, as the former is not sufficiently receptive of moisture for the strong, healthy growth of the plants, and the latter imparts its humidity too sparingly to their fibrous roots, in consequence of its great absorbing quality.

Experience has, however, shown that a thin, flaty soil, which rolls upon a sod-foi1 of the flaky kind, and which is greatly intermixed with rich mould, is well adapted to the hop culture, and affords equally full crops with those of the rich deep kinds. The soil near Middleton, in Kent, on which hops are extensively grown, is chiefly of this nature.

Such lands as have been long in the state of pasture, and of which course are much intermixed with vegetable matter, as those of old orchards, rich dry meadows, and other fertile pasture grounds, are in general the most proper for this use; but the hop may be grown on lands which have been under the plough, provided a sufficient quantity of manure be employed to afford a proper degree of fertility for the due support of the plants.

Whatever the state of the land may be, on which this sort of plant is grown, it should be perfectly reduced and broken down into a fine state of mould, to a considerable depth, by the repeated operations of the plough and harrow, or by being well trenched over by spade labour. The last is a very effectual method, where the land is to be broken up from the state of bare, though at present too expensive, in most situations, to be employed; but wherever it is requisite to, the work should be performed in the early part of autumn, in order that the ground may have the full operation and influence of the frosts, during the winter, upon them. These modes are both of them perfectly effectual in bringing hop-plantations into a fine state of mould, and at the same time, in clearing them of every description of weed that is injurious. During the concluding operations, where the plough method is practised, the land, if it be sufficiently dry, should be left in as regular and even a state as possible upon the surface; but where it inclines to be wet, it is better to have it ridged up, as by that means the superabundant moisture may be in a great measure discharged.

In all cases, just before the time of planting, a portion of compost, constituted of well rotted dung, and rich fresh vegetable mould, in the proportion of one of the former to two parts of the latter, well blended together for a considerable length of time, should be applied in the holes where the plants are to grow, in the quantity of about a bushel in each. This compost is usually set out over the whole of the

grounds first, and, after the holes have been formed, put into them.

The Sets and Methods of planting them out.—There are two sorts of sets occasionally made use of in forming new hop-plantations, as those made from the cuttings of the old plants, and root or bedded sets, which are taken off from the vines in breaking up old hop-grounds. The first sort is, however, most commonly made use of in the planting of new grounds, being formed in the early spring season. The latter sort is procured in the autumn from the old roots, in destroying former plantations. The cuttings should be made from the best and most healthy plants, each being cut to the length of about five or six inches, having two or three eyes or joints in it, as the buds from which the new plants are to take their origin. It is usual for them to be boldly by the hundred of fix score, at the rate of from thence to a full

length.

The work of planting is executed at different seasons, according to the kinds of plants or sets which are employed. Where root sets are made use of, the planting is generally performed in the autumn, about the end of October or the beginning of the following month, this being the period at which the former grounds are commonly dug up.

But where the cuttings of the plants are employed, the best season of planting is usually in the spring months, as from the end of February to the beginning of April, as the season may be suitable; this being the time of cutting over and dressing the old plants, when the sets can be most readily provided.

In the business of planting there are different forms and distances preferred by different planters, according to the method in which the culture of the crops is afterwards to be performed. In cases where it is to be executed by means of horse labour, which is the last expensive method, the best plan is that of setting them out in rows, at suitable distances, so as to form straight lines in all the different directions. But where the work is to be done by means of hand labour, this is not of so much importance, if proper care be taken to allow sufficient space for the perfect growth of the plants. Some, in this case, practise the row plan, while others have recourse to what they call a triangular plan. It is plain, however, that the planting in rows at equal distances, in such a manner as to admit of the ground between the plants being kept clean and in order by the harrow and midget, must be far less expensive than that of the irregular mode, in which hand labour can only be employed.

The different distances at which the holes and lifts are formed, on which the plants are to be set out, vary greatly according to circumstances. Some good planters recommend six feet and a half, or seven feet; while others are in the habit of giving preference to a five or six feet plant. In consequence of plants of this sort growing with great luxuriance and rising to great heights, of course leading forth much bind and foliage, they necessarily require a large space, as where they stand too close together, they are not only more apt to become infected with disease, but to keep or twist together above the tops of the poles, by means of which a large degree of shade is given as prevents the hops from completing their growth, and thereby lessens the quantity of produce in the crop. For these reasons it would appear, that the hop cannot be beneficially cultivated in a smaller space than five or seven feet; on rich good soils the latter distance may be the more proper, but on others of inferior quality, the former.

There is a method of planting practised in some districts on

Eils
foils that are inclined to a moist boggy state; which is that of forming the plantations in the bed-method, by digging them sixteen feet in width, and taking out the trenches three feet in breadth, and from two to two and a half in depth, the earth which is removed being evenly spread out over the large previously prepared beds. On these, after the holes have been formed a foot in depth, twelve inches in diameter, and six feet distant in each direction, the sets are put into the foil, in three rows on each large bed, in the manner that is usual in other cafes.

Making the Holes and forming the Hills.—The holes for the reception of the manure are marked out in various modes, according to the particular practice of the district, and the tale of the planter; for some it is the custom to have recourse to a line with knots formed in it, at the spaces which are intended for the holes; but others mark off at once the places for the holes, by driving short stakes into the ground at proper distances in each direction. There is, however, a more expeditious mode of proceeding than either of the above ones, which is that of striking furrows by the plough in different directions of the hop-gounds, at the necessary distances, in such a way as to constitute a kind of squares, the holes being formed in the angles where the furrows cross each other. Whichever method is followed, the holes are made by taking out the mould, to the depth of about twelve inches, by a spade, or, what is much better, by the tool termed a 'spad'; always forming them in a circular manner, with the diameters of about eighteen inches; the bottom mould or soil being a little stirred or loosened at the time. These holes are then to be filled partially with some of the compost already noticed, the mould that was taken out of them being replaced upon the compost, in such a way as to form small rilings or forts of hills. The sets or roots are afterwards planted out upon these hills, to the number of five or six of each, by means of a proper dibbling stick, one being placed exactly in the middle or top of each of them, and the rest at equal distances round it, at the distance of about four or five inches from the sides of the holes. It is usual to put the sets or cuttings into the depth of about two inches in the compost, in such a manner as to have the tops wholly covered by the mould on the surface part of the hills. It is thought better, however, by some planters, to have them covered lightly by the fine mould from the holes, after they have been planted out in the compost to nearly the above depth.

In setting out the plants on the large ridges, on the boggy forts of land just noticed, the work of hoeing and hilling is commonly performed towards the latter end of July, or beginning of the following month.

After the business of hoeing, hilling, and setting out the plants has been thus executed, nothing further is necessary to be done, until about the middle of May, except that of keeping the land about the plants well loosened, and perfectly clear from all sorts of weeds, at which time, in consequence of the growth of the young plants, it will be requisite to apply an additional quantity of fine mould about them on the hills, which should be scraped up from the intervals, with the view of checking the too luxuriant growth of the young shoots, and thereby promoting the vigour of the shoots; from which likewise twill the shoots together into a kind of knot. Others, however, think it better to make use of two small sticks, about a couple of yards each in length, which are set firmly into each hill, so as to direct the climbing of the shoots, two or three, or more, being led up each stick, and occasionally tied with basts or ledge during the summer season. There will be a second moulding necessary, in the same way, about the end of July, or beginning of the following month.

Where the planting is done on the boggy descriptions of land noticed above, the plants are poled in about three weeks with old short poles, to each of which two or more of the bundles are tied, the land being kept clean by hoeing and raking over occasionally. This method is however more tedious and expensive than the others, without much superiority. By the whole process the ground may probably be kept somewhat more dry and free from various moisture.

Other sorts of crops are by some grown along with those of the hop kind, such as those of the common bean, French bean, cabbage, and onion kinds; but this is a practice that should seldom be had recourse to, as injury may be done by it to the hop-plants, by their affording too much shade, and thereby preventing the free admission of air, light, and sun to the young birds. Onions are the least exceptionable sort of crop for this purpose, in consequence of their lower growth, and their requiring to be tress at the time the hop sets are put into the foil. For the first year or two after the hops are put into the foil they may therefore be employed in some cafes with benefit. All sorts of tall growing crops should, however, be carefully avoided.

Hop-plantations, though they require some years to come to perfection, should rarely, if ever, have any produce taken from them the first after they are formed, as by such means great detriment is often done to the future produce which they should afford. The Suffolk planters, in the mode of planting which they make use of, however, not unfrequently take a produce of from three to five hundred weight of hops, every first year. Where bedded or root sets are used in planting, a small produce is even capable of being taken the first season, as the plants or buds are nearly as forward at that period as those from cuttings are in the second.

In cafes where hop-gounds have been formed with care in these methods, and where the soils are well suited to the growth of the plants, they are capable of continuing in bearing for a great number of years, as twenty or more, the defects that take place in the hills being carefully supplied as they may occur. However, though this may be done, it isuggested as a better practice in most cafes to renew the plantations at considerably shorter distances of time, or to occasionally renew certain portions as they may be found necessary and convenient. And, in all cafes, to render such plantations as productive as possible, whether cultivated in the spade, plough, or hoe methods, the land in the intervals should be well stirred two or three times in favourable periods, and in particular cafes more frequently.

It is rarely necessary, in the second year of the plantations, to apply any manure to the hills; but the ground in the intervals should be well loosened and stirred in the autumnal season, in the same way as in the first year; however, in the early spring months, in suitable weather, as at once the middle of March, the hills should be opened, and the earthy mould well cleared away from the chief roots by a tool which is designated a picketer, in the view that the flocks may be properly pruned and drenched over; in which, all the bearing items of the preceding year are cut off within a joint or two of the roots, and all such shoots or suckers as were not permitted to be attached to the poles, or which have proceeded from the edges of the hills, completely cleared away, nothing being suffered to continue that can possibly injure or retard the healthy growth of the young plants or buds. Care should
It is found that this business requires particular regard in the carrying part of thesummer. When the bines prove unexpectedly strong and vigorous in their growth, and the hills have been poll'd with short slender poles, it may occasionally repay the trouble and expense, to have them repoll'd with those of taller and stronger kinds, and the short ones removed. In some instances great advantage has been gained in this way.

In the more early growth of the plants, the superficial bines of every fort should be repeatedly removed during the summer season, as they show themselves, merely referring one or two on each hill, to supply the situations of such as may have been injured in their first training to the poles, as such accidents not unfrequently occur, from the tender bines being bruised or twisted off by the great agitation caused by the action of the winds and other causes. These are the whole of the necessary operations in the culture of the hop, previously to the season at which the produce becomes ripe and ready for the hop-picker, which is known by the fragrant smell that is emitted from them, and their becoming firm, and of a brown colour. This usually takes place about the middle of September, but sometimes earlier.

**Picking the Hops.** — This is a business that requires much care and attention to see that every thing proceeds with propriety and dispatch, as there is constantly more danger to be apprehended from delay, the bines being equally exposed to mischief from the effects of the winds as those of continued rains. Preparatory to this work it is necessary to have proper baskets, and bins or cribs in readiness, and sufficient in number to the extent of hop-ground and pickers which it may be requisite to employ. These things being in due order, the hop bines are cut over close to the surface of the ground by persons used to the business, and the poles drawn up; and then placed upon the frame of the bines with the bines upon them, generally to the number of two or three, in order to the hops being picked from them. It is common to employ three or four pickers, or more, on each side of a frame, for clearing the hops from the bines, which, with the person whose bines it is to to fort the poles, are termed a set. But several sets are engaged in the same ground, where they are large. And it is not infrequent to employ women and children in this sort of work. When carefully separated from the bines and leaves, the hops are drop'd into cloths hung upon tenter hooks underneath, within the frame. As soon as this is fill'd, the hops are removed into a large sack, in order to their being taken home to be dried on a kiln for the purpose. It is constantly necessary that this should be performed as quickly as possible after the picking is done, that the hops may not sullen any damage by continuing together in their damp or moist green condition; as where this is the case, they are frequently liable, particularly in warm seasons, to be much hurt both in color and flavour, even in a few hours, by the flight fermentation which comes on. The kiln is of course kept constantly in readiness, and at work day and night during the picking season. The pickers should consequently be well proportioned to the quantity of hops that can be dried off. Where the hops are suffered to accumulate, they should be put in small parcels loosely placed together. See Hop-light, Hor-Fus, Hor-crib, and Oast.

Where crops of this sort are tolerably full, a good picker will separate from eight to ten bushels of hops from the bines in the course of the day, which, after being flowered or dried, roughly weigh about one hundred weight. It is not frequent to let the picking of hops, in some places, by the bines; at prices varying according to the state, or difficulty of
of providing labourers. It will be necessary to have from sixteen to twenty expert pickers, in favourable seasons, where the produce is good, and where the soil is capable of drying off about eighty bushels at each measuring. In addition to the poller and pickers it will be necessary to have another person in the plantation, in order to pick up the scattered and straggling branches of the birds, and convey the hops to the caddy or kiln. For this purpose a boy is sufficient, who, from the nature of his employment, is usually nominated the posy-boy. Horse or hand labour is employed in the conveyance of the hops, according to the distance from the kiln. The dryers should be perfectly steady and regular, and have a full knowledge of the business, as the profits of the planter greatly depend upon it; but the hop-grower should never be inattentive to these matters himself. The wages of the different people who are engaged in these operations vary much in different places, according to particular circumstances, but the Kentish hop-farmers formerly paid the pole pollers from eighteen pence to two shillings a day, with small beer, the dryers half-crown, with an unlimited allowance of beer and spirits, and the pickers three half-pence to two-pence a bushel, with allowances of spirits, &c.; but their prices are pretty nearly doubled at present.

After the business of drying has been executed, the hops are taken away from the kiln by a floater, and put in a room close at hand, formed for the purpose, and termed the warehouse room. Here they are kept for five, six, or a greater number of days, as there may be occasion, before they are become in a state proper for being put in the bags; as, when bagged too soon, they are brittle, and neither draw so good a sample, or weigh so heavy, as otherwise the case. The best criterion for it is to remain until they have attained a tolerable degree of toughness, which is readily known by the feel. See GROW.

Bagging the Hops. — In order to render the bagging of hops easy and convenient, a round hole or trap is cut out and formed in the floor of the warehouse room, exactly equal in dimensions to that of the mouth of the bag, on which a frame of wood is fastened, to which the edges of the opening of the bag are securely fixed quite round. Then in each of the lower corners of the bag a small handful of hops is firmly tied, when it is let fall through the hole to below, and the person termed the packer places himself in it, and by means of a heavy weight which he keeps constantly moving round in the places where he is not treading, pulls and forces the hops down in a very close manner into the bags, as fast as they are thrown into them, in small quantities at a time, by another labourer. The work proceeds in this way until the bag is quite full, when each of the upper corners has a few hops tied in them in the same manner as those at the bottom, which serve as handles for removing them by. The bag is then taken up, and its mouth properly secured, after being taken from the frame. The clover the hops can be intro-duced into the bags, the better they keep both in their color, smell, and taste. Some lots in the weight constantly takes place in the operations of drying, sloving, and rendering the hops proper for being bagged; it being the opinion of some that sixty bushels of well ripened fresh gathered hops, that have not been infested with the fly, will not, when dried and bagged, produce more than about one hundred weight. See HORSE.

Samples. — The goodness of samples of hops depends upon several different circumstances, but principally on the characters of the yellow farinaceous powdery matter which is sprinkled over them, and their colour; the former of which, in the language of the hop planter and dealer, is termed the condition, and the sample considered the more or less valuable by those who are purchasers, the more or less chamois it is in its feel; while it is of the greatest consequence in relation to the latter, that it should be preserved as bright as possible; yet it does not always follow that the brightest samples are the strongest in their flavour. These properties are likewise the result of the planter making a diligent inspection of the bags, as well as the field in which it is performed. See Horse.

Staking the Poles. — As soon as the picking and other operations have been executed, the poles should constantly be collected together, cleaved from the base that may be upon them, and set up in proper places; if the work has not been done already, while the business of picking was going on. The poles are liable to be much damaged by remaining on the ground when surrounded with bine. This stop of work is often done by the acre, which is probably the best method. The old short improper poles are at this time separated and referred for the new plants, so that the planter is enabled to ascertain the quantity of new poles that will be wanted for the next season, which it is highly advantageous to have provided and prepared during the leisure of the winter months. It is the custom to have the bark from all the poles, except those of the kind, in which it is necessary naturally the second season, that they may not be destroyed by the lodging of the worm in them. See Poles.

Clearing away the Bine. — Immediately after the leafless of drooping and slacking the poles has been completed, the bird should be cleared away, which, in some places is done by tying it up into faggots, bivies, or small bundles, when in a perfectly dry state, being then either stacked up or placed in fields or other situations, in order to be used as fuel in ovens or other ways. The work is usually executed at the rate of about fifteen per acre. Some planters however burn it upon the land, which others again permit it to be taken away by the labourers, for their own use. But the first is the best method. Whatever mode is in use, it should not be neglected to be removed from the ground as speedily as possible, in order that it may not interfere with the future culture of the plantations, such as the winter diggings of it, the applation of manure to the compost kinds, and the taking up of the old stocks of the plants when they become in a drooping state.

Product. — Hop crops vary more than most other fruits in the quantity of produce, being capable of affording, under different climates of soils and seasons, from two hundred to more than two hundred weight per acre. Upon the minding descriptions of soil, in pretty favourable years, it may be reckoned from six to eight or nine hundred weight, from ten to fourteen being mostly sufficiently good crops. So large a produce as twenty or thirty hundred weight but rarely happens, and cannot be much expected by the planter.

Expense of cultivating Hop Croys. — In the county of Kent, the price that was formerly paid for the several different operations that become necessary in their culture, such as Hilling, winter digging, cutting, preparing poles, pulling, tying, nipping, hoeing, picking and drooping, and slacking the poles, was about 4/. 11s. 4d. per acre. And the whole of the annual expense, following the growth to be ten hundred weight per acre, and the different operations executed at stipulated prices, by known neighbouring workmen who can be depended upon, to be 26l. 11s. od. including the undertaking for overlooking the plantation, who provide
workmen for the different operations, picking, drying, duty, rent, poles, manure, tythe, bagging, and midgeting.

But where the planter pays the several labourers himself, the expenses will amount to 29d. 11s. 4d. which leaves a profit of 19s. 4d. in favour of the former method of having the work performed.

The chief expenses at present stand a great deal higher, perhaps nearly one-half.

In the Hints to Gentlemen Farmers, the expenses and profits of cultivating hops are stated in this way.

**Expenses per Acre.**

The profit, from the expenses being lately so much augmented, must now be placed much higher.

The expense of forming new hop grounds is commonly very great, in many districts being found to be not less than from sixty or seventy, to one hundred pounds the acre. In some cases they now stand much higher.

The most favourable seasons for the growth of this sort of crops in the whole of their different stages, are such as are warm without too much wet, and where the south and southerly winds predominate, as they never answer well where there is continued wet weather, or when northerly or easterly winds prevail for any length of time in the summer season. Other causes of great injury to these crops are likewise found in hot gleams of sun-flame after falls of rain, or succeeding foggy mornings in the late summer months. Great mischief is also produced by high winds towards the time of picking, in consequence of the hops being much bruised and otherwise injured. The produce of such crops is rarely either good or abundant, where unfavourable weather occurs about the time the hops are in blossom, Vol. XVIII.

as a number of the bars never become perfect hops. Forward and luxuriant crops almost invariably suffer more from all the injurious causes which affect the hop-plant, than such as are later and of less strong growth. It may consequently be very useful in particular exposed situations to remove all the more forward binds.

To ascertaining the duty of this sort of produce, it is necessary for the planter to be in possession of the different acts concerning it. However, every grower of hops is bound to give notice, on or before the first day of September, of the number of acres he has in this sort of culture; the number and situation of his plots; and the place or places of bagging; which together with the store rooms, warehouses, &c. in which the packages are designed to be lodged are entered. And no hops can be removed from the rooms so entered until they have been weighed and marked by the proper officer; who marks, or ought to mark, on each package not only the weight, but the name and residence of the person by whom the hops are grown.

It may be noticed that the original duty was a penny on every pound weight, but the percentages that have since been added have raised it to about twenty-four shillings a bale, or thirteen shillings and fourpence the sack, which is nearly ten pounds the ton. These were the duties in 1795, but they have since that time been still further increased in a high degree. This large duty is usually paid to the collector of the excise for the particular district, and the grower has six months credit given him.

Hop crops are upon the whole both expensive and uncertain, and the cultivation of which should be well weighed before it is begun. Where the soils are quite suitable for them; and there are poles ready at hand upon the land, with a sufficient capital in the pocket of the planter, the hop culture is perhaps a kind of husbandry that may be practiced with benefit; but under other circumstances it will seldom be found profitable. Where hops are grown in connection with a farm, it is necessary to attend to the extent of land that can be managed without injury being done to the other grounds under tillage husbandry.

There are few field crops more exposed to injurious affections than that of the hop. In its more early growth it is liable to the ravages of an insect of the flea kind, just as it proceeds from the surface of the soil. When at a more advanced stage of its growth, it is exposed to the more destructive attacks of the green long-winged fly, the red spider, and the hop-moth. Lice are produced in large quantities by the former, in consequence of their depositing their eggs about the bottom parts of the plants, by which they are not unfrequently in a great measure destroyed; while the larvae of the latter prey upon the roots from which the plants become weakly in their growth, and unhealthy. About the same time the honey dew is another noxious fly to which the hop-plant is exposed, and by which it frequently suffers greatly. The mould or fen generally takes place at a rather later period, but is not less prejudicial in its attacks. The blight and fire-blight, to which hop crops are likewise subjected, occur at different periods, but commonly towards the more late stages of the growth of the crops. All these different causes are extremely detrimental to the hop-planter, frequently proving suddenly destructive to his most promising crops. See Blast and Light, Flea, Honey-dew, Leptogaster Fly, Mould, Mildew, Red Spider, and Otter-Moth.

Hops, Dijces of. See Fire-Blast, Fen, Honey-Dew, &c.

Hops, Ufe of. In the spring time, while the bud is yet tender, the tops of the plant being cut off, and boiled, are eaten
HOP

eaten like asparagus, and found very wholesome and effectual
to loosen the body; the heads and tendrils are good to purify
the blood in the scurvy, and most cutaneous diseases;
decocations of the flowers, and syrups thereof, are of use
against peptitellaneous fevers; juleps and apoxems are also pre-
pared with hops, for hypochondriacal and hysterical affec-
tions, and to promote the menses.

Extract of hops, *extraictum bunnum*, is made by boiling down
half a pound of hops in a gallon of boiling water to four pints,
straining the hot liquor, and evaporating it to a proper con-
sistency. It is introduced into the London Pharmacopoeia,
because it is supposed to posses both a tonic and sedative
power combined.

A pillow stuffed with hops, and laid under the head, is
said to procure sleep in fevers, attended with a delirium.
But the principal use of hops is in the brewery, for the pre-
maintenance of malt liquors; which by the superaddition of this
balsamic, aperient, and diuretic bitter, become less virulent,
lefs apt to turn four, more detergent, more dispersive to pills
off by urine, and in general more salutiforous. They are said to
contain an agreeable odoraneous principle, which promotes
the vinous fermentation. When lightingly boiled or infused
in warm water, they infuse its fermentation.

 Hose Laws relating to. By 43 Geo. Ill. c. 58, for
every hundred weight of hops imported, shall be paid a duty
of 3l. 5s.; and on exportation there shall be allowed a draw-
back of 4l. 4s.; and for every pound of Irish hops imported
a duty of 2s. 6d. (43 Geo. Ill. c. 69.) And foreign hops,
landed before entry and payment of duty, or without war-
rant for landing, shall be forfeited and burnt; the ship shall
also be forfeited, and the person concerned in importing or
landing shall forfeit 5l. a hundred weight. (7 Geo. II.
cap. 19.) Hops of British growth may be exported to Ire-
lund; bond being first given to the commissioners of excise,
that the said hops shall not be relanded, and oath made
before such person as they shall appoint, that the duties have
been duly charged; upon which the person exporting the
name shall have a drawback of the duties before paid; and
provided that such hops shall be relanded, or put into any
ship in Great Britain (except in case of shipwreck, or un-
avoidable accident), the name, or the value thereof, shall be
forfeited, over and above the penalty of such bond; and
may be seized by any officer of the customs or excise.
(26 Geo. Ill. c. 5.) And for every hundred weight of hops
grown in Great Britain, which shall be cured, and made fit
for ufe, shall be paid by the owner or possessor thereof, a
duty of 2s. 6d. (43 Geo. Ill. c. 69.) By 9 Anne, cap. 12.
hop-gounds are required to be entered, on pain of 40s. an
acre. Places of curing and keeping are also to be entered,
on pain of 50l. which may be visited by an officer at any
time without obtrusion, under the penalty of 2cl. All hops
shall, within six weeks after gathering, be brought to
such places to be cured and bagged, on pain of 5l. a pound.
The bagging of foreign hops in British bagging for sale
or exportation, incurs a forfeiture of 1cl. a hundred
weight; and defrauding the king of his duty by using
twice or oftener the same bag, with the owner's mark
upon it, is liable to a penalty of 4cl. The removal of
hops before they have been cured, bagged, and weighed,
and the duties ascertained, incurs a penalty of 50l. Con-
cealment of hops subj ects to the forfeiture of 2cl. and the
concealed hops; and any person who shall privately con-
vey away any hops, with intent to defraud the king and
owner, shall forfeit 5l. a pound. And the duties are re-
quired to be paid within six months after curing, bagging,
and weighing, on pain of double duty, two-thirds to the
king, and one-third to the informer. No common brewer,
&c., shall use any bitter ingredient instead of hops, on pain
of 2cl. Notice of bagging and weighing shall be sent in
writing to the officer, on pain of 50l. (6 Geo. cap. 21.)
And twenty-four hours' notice shall be sufficiently, by 39 &
40 Geo. Ill. cap. 81. Officers shall make due returns to the
commissioners, and leave a true copy with the planter, or
owner, of forfeit 4l. 9 Anne.

The owners of hops shall keep at their oaths, &c., just
weights and scales, permit the officer to use them, and affix
in weighing, if required, on pain of 50l. A penalty of 1cl.
is inflicted for false scales and weights. No officer inferior
to a supervisor shall weigh hops between five in the evening
and four in the morning, on forfeiture of 2ol. (39 &
40 Geo. Ill. c. 81.) By the fame, repealing the 14 Geo III.
c. 68. the owner or grower, before he begins to put any
hops into a bag or pocket, shall mark his on the outside,
in large legible characters, with durable ink or paint, his name
and place of abode, on pain of forfeiting 5cl. nor shall hops
be bagged into any bag of greater weight than in the propor-
tion of 1cl. for every 121b. of the grofs weight of bag
and hops, on pain of forfeiting 2ol. The officer, after
weighing, &c., hops for the purpose of charging the duty,
shall mark in like manner on every bag or pocket the grofs
weight, together with the year of growth, and the progre-
sive number according to the number of bags charged to
each owner or grower in each such current year; counter-
feiting such marks incurs a penalty of 1ol. &c.; and wilfully
defacing or obliterating them, or caufing the fame to be
done, subjects to a forfeiture of 2cl. The owners are allowed
to use cafs instead of bags, under the fame regulations.
(6 Geo. cap. 21.) No hops shall be removed from the place
of weighing, until twelve hours next after bagging, weighing,
&c., unless the same shall have been weighed by the super-
visor; and if any additional weight shall be found, the fame
shall be charged with the duty; and if any owner or grower
shall convey away any such hops, contrary to the meaning
thereof, he shall forfeit 5cl. for every such offence. (39 &
40 Geo. Ill. c. 81.) If any perfon shall mix with hops
any drug to alter the colour or scent, he shall forfeit 5l.
a hundred weight. If any perfon shall unlawfully and mali-
cious cut hop-binds growing on poles, in any plantation,
he shall be guilty of felony, without benefit of clergy.
6 Geo. II. cap. 37.

Hor-bag, in Agriculture, the name of the sack-cloth bag
in which the stoved and dried hops are stuffed in order to
their being fold. There are two sorts of cloth employed
in this intention, according to the nature and quality of the
hops; such as are of a bright fine colour and a good sample,
being put into such bagging as is of a fine kind, under the
denomination of pockets; but tho' which have a dark co-
lored into a coarse heavy kind, termed bags: the former of
these sorts of hops is employed for ales, and all the hicer
kinds of malt-liquors, but the latter chiefly for the brewing
of porter. It is supposed that the coarse fort of bagging-stuff
is the best, where the hops are to be kept for some length
of time.

The necessary lengths of these sorts of bagging are about
twice or a quarter for the bags, and nearly the same for
the pockets, each of them having an ell in width. The first,
or bags, when the hops are of a prime quality, well cured,
and trodden into them with tights elsewhere, will weigh about
two and a half hundred weight; but the latter, or pockets, when
of Canterbury pocketing, only about one and a half-hundred
weight.

In cases where the variations from these standards are in
any degree considerable, the preparation or sample may be
suspected with propriety.
Hop-basket, the name of a kind of large flat basket employed for carrying the hops in, during the period in which they are picked.

Hop-bin, the name of the crib or bin, into which the hops, after being picked from the ground, are thrown. It is usually constructed merely in a temporary way, by fixing four or more pieces of boards upon as many upright posts set firmly into the ground as a frame, by means of nails. When finished, they should be full seven or eight feet in length, three feet in breadth, and the same in height, the side pieces at the ends projecting as a sort of handles. Each end has a support, which rises two feet above the top of the frame; on the tops of which rests a straight pole, the whole length of the frame, or rather more; the whole structure having somewhat the resemblance of a small market-booth, without a covering; only that, in the place of the flat surface for the reception of the wares, there is a canvas bag adapted to the size of the frame, hung within, so as nearly to reach the ground, in order to receive the hops as they are picked from the frame. Such as are formed eight feet in length are usually termed bins, and those of four feet in length half bins. The contrivances of this nature should confinately be well proportioned to the number of pickers that are employed, in order to prevent the loss of labour, which would otherwise take place.

Hop-clover, the common name of a plant of the clover kind, which grows naturally in most meadows and pature lands of the more dry descriptions, commonly flowering towards June, or the following month. It has been advised of late as beneficial in laying lands down to sward, when combined with other seeds of the grass kind; and is afforted to afford an excellent fodder, when found on the lighter sorts of soils. See Clover.

Hop-dig, a name given to a sort of lever formed from a long piece of strong round timber, having a kind of fixed fulcrum or rest at the lower part, the end of which is set or fixed with a strong piece of toothed iron, which firmly graps and holds the bottom end of the hop-pole, when, by the action of the lever, the hop-pole is wrenched up from the ground, and much labour saved.

Hop-barrow, a name given to a sort of harrow that is employed after the nidget by different hop cultivators, in order to bring the foils into a very fine flat of mould. It is constructed pretty much in the form and on the principle of the nidget, having only a small wheel fixed in the front of it, in order to turn round at the ends of the rows, with more facility than would otherwise be the case. It is guided in the intervals or alleys, and the bruising of the binds prevented, by having a pair of handles fastened on behind, and held by a man. The tool complete consists of two guineas.

An implement of this sort is stated in the Middlesex Report to have been found highly beneficial in the practice of Mr. Maynard; it is so constructed as to have somewhat the form of the snow-plough, being an equilateral triangle, the sides of which are four feet in length, and the front one fixed with old eyeths; the whole being strongly framed and put together, that it may bear to be loaded when it is made use of in the work.

It is suggested that, by drawing this tool once in a place in the intervals between the rows of plants, it is capable of rendering them "perfectly clean, and as smooth as the well rolled walk of a pleasure ground," besides, earthing up the rows in the same operation, which, in about ten days or a fortnight afterwards, may be readily formed by means of spades, into hills for the reception of the plants.

Hop-beehive, a term applied to a small building or place of shelter, in which the beekeepers picking the hops from the

bonds may be executed with convenience, in cases in which the plantations are at some considerable distances from the housetops of the proprietors. In this way labour and expense may often be saved to the hop farmer.

Hop-bow-beam, in Gardining. See Carpinus.

Hop-nidge, a name given to a tool formed in a somewhat triangular manner, but of different dimensions according to the distances of the alleys or intervals in which it is to be employed, having crofs bars or beams into which are fixed a number of hoes, proportioned to the breadth of the intervals in which they are to work, in such a manner that the hinder part, which is the widest, may pass along without doing any fort of mischief to the binds on the different sides of it. A pair of handles is fixed to it behind by means of which it is directed in the execution of its work. It is usually drawn by a single horse and managed by a boy; and in this flat is capable of clearing two acres in the course of the day. In making use of it, care should be taken that in completing the labour, the intervals or alleys be all gone over or croffed in the same line of direction; as by this means every part of the surface, except the portions occupied by the hills, may be effectually cut over. The spaces forming the hills must afterwards be cleaned and rendered free from weeds by hand-hoeing. This tool should continue to be made use of occasionally as there may be necessity, until the hop plants begin to branch out in such a way as to impede the passage of the horse in the alleys or intervals of the rows. In this mode hop-plantations are capable of being kept in a clean condition and perfect order, at much less expense than by means of hand labour, either by the hoe, or digging over in the summer season. The principal circumstance that requires to be attended to in the nidget management of hop-groungs is that of preventing the bonds from being injured, by the tool coming too much in contact with the poles during the performance of the work.

Hop-saff, the name of a sort of oven or kiln in which the hops, after being separated from the bonds, are flaved or dried by being exposed to proper degrees of heat under the direction of a person who has the exclusive management of the business. See Oast.

Hop-picker, a term applied to a tool contrived for the purpose of forming the holes for setting the hop-poles in, in ground of this kind; and which is a sort of strong iron crow, with a firm wooden handle placed croffways at the top, and made thick and tapering to a point at the bottom part, fo as to readily remove the earth and make way for the insertion of the lower ends of the hop-poles, into the solid ground, in order to their standing firmly for the support of the bonds.

Hop-picker, a term applied to the person who is employed in picking the hops from the bonds, as soon as they are in a state of maturity for the purpose. Numbers of people are engaged in this sort of work in large hop-groungs.

Hop-poles, the name of the poles or strong stakes which are forced into the firm ground for the purpose of the hop bonds climbing up and twining round them, in order to their being supported and kept from trailing upon the ground. Poles of this kind are daily becoming more scarce and expensive. In the account of the rural economy of the southern counties of the kingdom, it is stated, that "the species of woods in use for hop poles are various. Formerly they depended much on the natural growth of the coppice woods of the country. But of late years, it has been the practice to make plantations for the especial purposes of hop poles."
In sharpening or pointing the bottom ends of hop poles, it is usual for the light short ones to be done in the hand without any support being required; but such as are tall and heavy, and in need of some sort of contrivance to keep them steady and upright. This is generally afforded by the simple contrivance of tying three poles of equal lengths together, at two or three feet distance from their tops, and then setting them up in the form of a fort of triangle. This receives the top of the pole which is to be sharpened between the points or horns of the triangle, and affords the necessary stay to it; there being a block of wood placed suitable below to work upon. It is common for this fort of labour to be performed on new as well as old poles, before they are flacked up or set in piles; though occasionally only just before the time of using them. It is usual, in pointing such poles as have been already in use, to strike off the portions which have had in the ground where they appear much decayed, and point the found parts above. But where such bottom parts continue firm and found, they are re-sharpened for another crop.

The flacking up of the poles is a business that is best performed immediately after the picking of the hops has been finished. It is universally the practice, in the district of Weald Kent, to set up the poles in a kind of conical piles containing from two to five hundred each. This is effected by three flout poles of equal lengths, being bound together a few feet from their tops, and their legs spread out so as to stand firmly. This forms the support and flay of the pile while it is building, and afterwards; the poles being regularly dropped in on each side between the points of the three poles first set up, so as to be equal on every side, as on this the stability of the flack depends. The slope and diameter of the base of a pile is variable according to the length and number of poles which are set up together. A flack of three or four hundred of the long poles, met with about Maidstone, will take up a circle of near twenty feet in diameter. It should, however, be noticed, that the bottoms of the poles do not form one entire ring; but are collected into a fort of bundles or &dagger;flackstiles, mostly from three to fix or eight in number; each portion being bound tightly together a few feet distant from the ground, by means of a strong band formed from the twirled vines, by which the wind is prevented from separating the poles; and at the same time the openings between the several parcels give passage to violent blasts, and prevent in some measure the piles from being wholly thrown down; an accident, however, which rarely occurs in such grounds as are tolerably sowned. But, in high exposed situations, where quantities of these poles are often piled up for sale amongst the planters, it is no unusual thing for the piles to be blown down, to the utter destruction of sheep and other animals sheltering underneath them.

The continuance or lasting of hop poles depends greatly on the fort of wood which is in use and the time of its growth, as well as in some measure the quality of the soil, and the exposure in which it has grown. Chestnut poles of eighteen or twenty years growth, are in general esteemed the most durable of any. It has been confidently affered, that a hop pole of this fort has been employed in a hop ground for upwards of thirty years; but the usual duration of poles is from about five to twelve years; or thereabouts. When the poles become no longer useful for the strong growing plants, they are mostly either transferred to those of lees growths, or laid by for use in young plantations, being ultimately converted to the purposes of fire wood, or the making of charcoal for being mixed with the coke of coal in drying the produce. They are worth

About

H O P

1st Chefnut, 6th Maple.
2d Ash, 7th Oak.
3d Sallow, 8th Hornbeam.
4th Red-willow, 9th Beech.
5th Birch.

Besides these the alder, or cawder, the brown willow, and some other similar sorts of light woods, make excellent hop poles.

It has been hinted, by an intelligent hop cultivator, that the hop, as well as other climbing plants, may have a predilection or choice of particular woods as supports; and that a rough soft bark may be preferred by them, to one which is more smooth and polished. That of the maple is particularized, as its bark is peculiarly "soft and warm;" it being noticed that when the morning has been cold, the sensitive leader of a tender or fresh-pole vine has reclined its head against the velvet bark of the maple, while others held their s aloof, from chilly smooth barked poles. It is probable, that this may be a general law or ordinance of nature, among climbing plants, and may be essential to their preservation, exhibiting, in a most palpable way, the perception and strength of vegetable instinct. These plants, it is likewise well known, have their instinctive choice or predilection with regard to the thickness of the articles of their support; being found to embrace with greater readiness a pole that is not of too great thickness, than one which is of much thickness towards the bottom part. The usual circumference of poles, at the bottom ends, may be rated at from about six to nine inches, tapering up to the top, where they are mostly about the size of a strong walking flack.

The length is commonly about fifteen or twenty feet, but sometimes more different sorts of ground require poles of very different lengths. In the rich fertile hop grounds in the vicinity of Maidstone, in Kent, the poles of grown hops usually stand from about fourteen to sixteen feet above the surface of the hills, and have from eighteen inches to two feet below the surface of the ground. But on grounds of lees strength, the poles are not found to rise more than ten or twelve feet in height. For this reason, a variation of the quality of the ground is beneficial, as the poles, by rotting and decaying at the bottom parts, become shorter, and, after a few years, get too short for strong vines in rich strong land. Yet it is not the custom for them to be toed or removed to lees productive hop grounds for the support of vines which have an inferior growth and luxuriance.

In these districts it was found that the prices of hop poles varied, in 1790, from fourteen to forty shillings the hundred. In proportion to the size and quality of them; being commonly furred under three divisions; first, seconds and thirds; but in 1797 they became considerably lower, "prime poles being then thirty shillings." They have, however, been constantly upon the advance since that period, and are at present become both extremely scarce and dear. The custom with the new poles is occasionally to have the bark flaved off, under the notion that it faves them from the worm; but some hop planters suppose that there is a warmth in the bark which is agreeable to the young vines; and though in two or three years the bark may drop off naturally, the surface of the wood, in the course of that time, has acquired a degree of softness. Allowing a hard, smooth polished pole to be unfriendly to the hop, it would obviously be improper to pole the poles.
about five or six shillings the hundred in each of these views.

The annual expense of poles, taking the new ones at thirty shillings, the number made use of at three thousand
per acre, their duration eight years, and the value of the old refuse ones at five shillings the hundred, was formerly
about five pounds the acre; but at present it is in all probability
nearly, if not quite, double that sum. On account of
this great expense of poles, and its chiefly arising from the
decay of the parts infested into the ground, and the mis-
chief that frequently happens on their being broken off at
the surface of the ground, in the time the crop is ripening,
it would seem to be a desirable object to prevent the destruc-
tion of that part as much as possible. In order to effect
this, clearing the parts has been recommended as a desirable
plan, especially those parts which are exposed between the
air and moisture close to the surface of the ground, as the
decay generally commences in those places the first. See
CRUMBING POLES.

Hop-field, the name of an implement of the thin kind
used in hop-gardens, and constructed with a strong frame,
wherein the way of the common wheel-barrow, having
feet or teeth which cut up or drag out all firm weeds as
may infest the land, while they break it down and render it
fine at the same time. According to the Report of Kent,
this is a sort of tool that may be also beneficially employed
in clearing summer fellowes from weeds. When properly
constructed it cuts off a couple of guineas. It has great
power in working-over land when well managed. See SIM.

Hou-tree. See HOLLY.

Hop-trefoil, a common name only applied to a plant of
the trefoil kind, and sometimes to that of hop-clover. See
TREFOLI.

Hop-Wild. See SHrub TREFOLI.

HOPE, in Ethica, is the desire of some good, attended
with a belief of the possibility, at least, of obtaining it,
and enlivened with joy, greater or less, according to the
greater or less probability of our posseiling the object of
our hope. Alexander, preparing for his Aion expedition,
distributed his hereditary dominions among his friends;
allotting to some villages, to others boroughs, to other
cities; and being asked what he had reserved for himself,
replied, Hope.

Pindar, as cited by Plato (De Repub. 1 5) calls hope
the nurse of old age. It was virtue, according to Cicero,
that inspired the hope of immortality; and that fame immor-
tality animated hope. There is nothing melancholy, says he,
(De Senect. c. 1) in death, which leads to immortality.
The heathens deified hope. Cicero (De Leg.) speaks of one of
the temples of this goddess. Livy mentions that which
flood in the market for herbs, and of another which Publius Vitet
erected to her in the seventh region. M. Fulhiss, the cenfor,
erected another to her near the Tiber. The Greeks also
worshipped this divinity under the appellation HEBR, Elpis.
Hope is represented upon some ancient monuments, but
often upon the medals of the emperors, sometimes with
these words, "Spes publica," "Spes pepli Romani;"
sometimes with a cornucopia, or with flowers and fruits, or
a bee-hive. We find her often with one hand resting upon
the altar, which M. Aurelius Paccorus dedicated to her. As
she had her temels and altars, she had also, without doubt,
sacred places; but antiquity gives us no account of the vic-
tims that were offered to her.

HOPE, in Geography, a river of Jamaica, which runs into
the sea; five miles S. of Kingston.—Also, a large bay at
the N.E. corner of Nouka found, between "Point Break-
ers," N. lat. 49° 15'. E. long. 233° 20', and "Woody Point,"
N. lat. 50° 28'. E. long. 232° —Also, a bay in the English
channel, on the coast of Kent, between Sandwich and Ram-
gate.—Also, harbour of the W. coast of Quadra and Van-
couver's island, in the N. Pacific ocean.—Also, a small island
nearest the coast of Rhode island, in America.—Also, two small
islands, near the N.E. coast of New Holland, so called by
Captain Cook, when his ship was rescued from its instantly
perilous situation off Cape Tribulation. S. lat. 14° 47'.
W. long. 214° 56' —Also, a Moravian settlement in We-
chowia, North Carolina, in Surry county, where the united
brethren have a meeting.—Also, a township in the county of
Durham, Upper Canada, W. of Hamilton, and fronting Lake
Ontario.

Hope's Advance Bay, a bay in Hudson's fleet; 100
miles W. of Chudley.

Hope's Noise, a cape in the English channel, on the coast
of Devonshire. N. lat. 52° 28'. W. long. 3° 27'.

HOPEA, in Botany, so named by Dr. Garden, and
adopted by Lindan, in honour of their mutual friend the
late Dr. John Hope, professor of botany at Edinburgh, who
died in 1786. This gentleman richly deserves commemoration,
as being one of the earliest lecturers on the vegetable
physiology, as well as an experienced practical botanist.
Those who knew his personal merits, will readily accede to
any thing that may serve to embalm so worthy a name. The
genius originally chosen for this purpose has proved unfortu-
ate, being now, justly we believe, referred by l'Heritier to
Symphoros. See Tr. of Linn. Soc. v. 1756, and Willd.
Sp. Pl. v. 3. 1456. It is singular that the Linnaean Allenia,
named by Mutis after Dr. Hope's predecessor, should have
precisely the same fate, being also a Symphoros. We are
therefore obliged to admit as Hopea a little inconsiderable
Earl Indian plant, which Willdenow and Vahl have so deno-
minted, though we are by no means satisfied of its being
distinct from Exacem. Dr. Buchanan had defined the
Dipteryxorum of the younger Gartner to commemorate his
friend and preceptor, and it is much to be wished that fo
a genus had been adopted as Hopea—Vahl. Enum. v. 1. 3-
435. Vahl!—Clavis and order, Monandria Monogynia.

Gen. Ch. Cal. Perianth inferior, in four deep, lanceolate,
speaking, equal segments. Cor. of one petal, funneled-shaped;
tube short inflated; limb in four equal, spreading, or reflexed
ovate segments. Stam. Filaments two, inserted into the
tube, very short, linear, opposite, one of them short and
barren; anther solitary, globoso, two-lobed. Pfl. German
superior, roundish; style cylindrical, very short; stigma cap-
itate, globoso. Peric. Capsule roundish, of two valves and
one cell. Seeds numerous, minute.

Efl. Ch. Calyx in four deep equal segments. Corolla of
one petal, funneled-shaped, four-eفقد, equal. One barren
flamen. Capsule with two valves, one cell, and many seeds.
1. H. echinatum. The only species gathered by the Rev.
Dr. Rottler at Tranquebar. We have never seen a specimen,
but a drawing communicated by Lieut. Col. Hardwicke,
the Exacem fuillium of Roxburgh, answers so well to the de-
scription in Vahl, that we have no doubt concerning it. This
is a small, smooth, pale, annual, fibrous-rooted plant, flow-
ering in December. The stem is from one to three inches
high, branched, forked, leafy, slender, square, with membra-
nous angles. Branches alternate or opposite, spreading.
Leaves opposite, sessile, small, acute, entire, three-ribbed;
the lower ones ovate, upper ones gradually narrower, and
uppermost awl-shaped. Flower-stalks very short, solitary in
the forks of the branches, three together at the extremities.
Flowers small, yellow, with a pale tube. Seeds red.
If the capsule be really of one cell, and the flammen constant two, one of them barren, this plant may possibly contain a good germ, but in our drawing the capsule appears of two cells, and on the whole we are more disposed to think it an Exacum, notwithstanding the peculiarity of the flammen.

HOPEWELL, in Geography, a township of America, in Cumberland county, New Brunswicke, on Chepoodil river, which runs into a northern arm of the bay of Fundy, and is navigable for four or five miles.—Also, the name of three townships in Pennsylvania; viz. in York, Huntingdon, and Washington counties.—Also, a township in Hunterdon county, New Jersey, on Delaware river, 14 miles W. of Princeton, and 11 above Trenton. In 1750 it contained 2320 inhabitants.—Also, a township in Cumberland county, New Jersey.

Hopewell Head, a cape in Hudson’s bay. N. lat. 58° 10’. W. long. 78°.

HOFGARTEN, a town of Germany, in the archbishopric of Salzburg; 38 miles S.W of Salzburg.

HOPITAL, L., a town of France, in the department of Mont Blanc, and chief place of a canton, in the district of Chambéry. The place contains 662, and the canton 8346 inhabitants, on a territory of 1577 square kilometres, in 15 communes.—Also, a town of France, in the department of the Rhône and Loire; 17 miles S. of Roanne.—Also, a town of France, in the department of the Lot; 24 miles N.E. of Cahors.

HOPKINS, JOHN, in Biography, one of the principal verifiers of the psalms at the time of the Reformation, with Sternhold. These were the fathers of metrical psalmody in our country, equally injurious to the divine poetry of the psalmists, and to the composition of sacred music. The melodies to which these versicles are sung, were chiefly German. See Psalmody.

HOPKINS, EZRA, was born at Sandford, in Devonshire, about the year 1653. In 1649, he became a chorister of Magdalen college, Oxford, and after he had taken his degree of B.A. in 1653, he was appointed usher of the adjoining school. In 1659, he went to Ireland as chaplain to lord Roberts, afterwards earl of Truro, who was appointed lord lieutenant. He married his lordship’s daughter, and was made dean of Raphoe. Upon his return to England, lord Roberts recommended him so strongly to his successor lord Berkeley, that, in 1671, he was consecrated bishop of Raphoe, from which see he was translated, in 1681, to that of Londoonderry, where he continued till the war which broke out between the supporters of the revolution, under king William, and the partisans of king James, headed by the earl of Tyrconnel, when he retired to England. He was now chosen minifter of Aldermanbury, where he shortly after died, at the age of fifty-seven. After his death, his poetical works were published in one volume folio. His most valuable piece is “An Exposition of the Lord’s Prayer,” first printed in 1609, which were afterwards added sermons on Providence, and the advantage of reading and studying the holy scriptures. Gen. Biog.

HOPKINS, WILLIAM, a learned divine of the church of England, was born at Monmouth in the year 1706. He received the elements of a learned education at his native town, whence he went to All-Souls, Oxford, in the year 1724. He was admitted to deacon’s orders in 1728, and in the following year undertook the curacy of Waldron, in Swith. In 1731, he was presented to the vicarage of Bolney, in the same county. In 1753, he published anonymously, “An Appeal to the Common Sense of all Christian People, more particularly the Members of the Church of England, with regard to an important Point of Faith and Practice, imposed upon their Consciences.” This piece excited much attention, and created no little alarm among the believers in the doctrine of the Trinity. Many answers were written, but at length Dr. Thomas M’Donnell wrote an octavo volume against the principles contained in the “Appeal,” to which Mr. Hopkins replied. The controversy was carried on many years, and our author published other tracts on the same subject. In 1756, he was elected master of the grammar school of Cuckfield, without any other conditions than that of taking the oaths to government. In the year 1766, Mr. Hopkins undertook the curacy of Slaughton, and continued to officiate there many years, and in his own parih of Bolney, upon what he judged to be the gospel plan. He was an active and zealous promoter of a petition to parliament for relief, in the matter of subscription to the liturgy and thirty-nine articles of the church, and put forth able works in defence of the cause. The last piece which he sent to the press was “Exodus, a corrected Translation, with Notes critical and explanatory.” This was in the year 1784; almost immediately after this, Mr. Hopkins’s health began to decline, and his mental faculties were greatly impaired before his decease, which happened in 1786, when he had attained to his eightieth year. Mr. Hopkins was an Arian in his religious faith, and admitted the lawfulness of praying to Jesus Christ, but he could not join in the invocations to him as being himself God. Mr. Hopkins was possessed of great knowledge in the original languages of the scriptures, and was a most diligent student in theology.

HOPKINS, or Hopkinville, in Geography, a township of Caledonia county, in Vermont.

HOPKINTON, a township of Middlesex county, Massachusetts, incorporated in 1715, and containing 1372 inhabitants. The rivers Concord and Providence receive each a branch from this township; and these streams furnish fefts for seven or eight griff-mills, a number of saw-mills, iron-works, &c.—Also, a township in Washington county, Rhode Island, on the W. line of the state, on several branches of Pawcatuck river; containing 227 inhabitants.

HOPLITES. HOPLITE, formed of ἔπος, armour, in Antiquity, were fuch of the candidates at the Olympic and other fared games as ran races in armour.

One of the finest pieces of the famous Parrhasius, was a painting which represented two hoplites; the one running, and seeming to sweat large drops; the other laying his hands down, as quite spent, and out of breath. Phivy, lib. xxxv. cap. 10. and Pachal De Coronis, lib. vi. cap. 14.

HOPLITIS LAPIS, in Natural History, a name given by some of the writers among the ancients to a stone to a thinning brahs-like appearance, looking like the surface of a polished brass armour worn in those times. It is easy to conclude, from this account, that the hoplites was one of our muncies.

HOPLOTODROMOS, formed of ἔπος, armour, and ὁπλός, I run, in the ancient gymnastic sports, a term applied to such person as went through those toilome and robust exercises, in complete armour; by which the exercise became much more violent, and the wearing of armour, in the time of battle, much more easy.

HOPLOCHRISMA, a term used, by the ancient writers in Medicine, for the anointing a sword, or other weapon, with which a peron had been wounded, in order to the curing of the wound; for early was the idle notion of curing by sympathetic remedies received into the world. Some late authors have also used the word in a very different sense, namely, for the anointing the points of darts or swords with poifous ingredients in order to render the leaf
head wound given with them fatal; a practice most known, as it is said, among the savage inhabitants of America.

HOPLOMACHI, ὁπλομαχος, composed of ὄπλος, armour, and μαχης, I fight, in Antiquity, were a species of gladiators, who fought in armour; either completely armed from head to foot, or only with a casque and cuirass.

HOPPER, a vessel wherein feed-corn is carried at the time of sowing.

The word is also used for that wooden trough in a mill, into which the corn is put to be ground.

HOPPET, in Minyas, is a small hand-basket or whisket, used for holding and carrying ore, &c. It also means a square or oblong dish or box of wood, narrowest at the bottom, holding 14 or 16 pints, which is used, level full, in measuring lead ore by the bar-masters, in the low and high peaks or hundreds of Derbyshire.

HOPPLE, a term applied to different animals, as the horse, sheep, &c. which signifies the fettering or restraining of them, by tying their two fore legs together with a short longature or band of some fort or other.

HOPTON, Arthur, in Biography, an English mathematician, was son of Sir Arthur Hopton, and born in Somersetshire. He was educated at Lincoln college, Oxford, and after taking his degree of B.A., removed to the Temple, where he lived in habits of friendship with the learnedelden. He died in 1614, a very young man, not having attained to more than his twenty-sixth year. He wrote a treatise on the "Geometrical Staff"; "The Topographical Glas, containing the Udes of that Instrument, the Theodolite, Plane Table, and Circumferrentor"; "A Concordance of Years, containing a new and a most exact Computation of Time, according to the English Accompt"; "Prognostications for the Year 1627 and 1614."

HOPTON, Susanna, an ingenious lady, was descended from an ancient family in Staffordshire, and was born in 1627. In her youth she was drawn over to the church of Rome, but subsequent enquiry restored her to the Protestant communion. She died at Hereford in 1709; as an author, she is known by several books on practical piety, and by an expository or meditations on the fix days of the Creation, &c.

HOCQUETUS, Hocetus, or Hosius, a term used in the old Latin languages, and in the confuses of music by the heads of the church and grave divines, seems to imply a fantastical division, which by the sudden leaps and breaks, or discontinuity of voice, resembled a hiccup, in French hoguet. "They intersect the melodies with hoguetes, slide about in deficient, and sometimes even crowd and load the chants with vile third and fourth parts, triplis et motetis vulgarissimis."

HOR, in Scripture Geography, a mountain of Arabia Petraea, on the confines of Idumea. Here Aaron died and was buried. See AARON.

HORACE, Quintus Horatius Flaccus, in Biography, one of the most celebrated of the Roman poets, was born at Venusium in the year 65 B.C. His father was the son of a freed-man, and followed the employment of a tax-gatherer; but notwithstanding the meanness of his origin, he felt the importance of a good education, the advantages of which he resolved his son should enjoy. He accordingly took him to Rome, and caused him to be instructed in all the branches of knowledge which were taught to young people at that time. At the age of eighteen he was sent to Athens for the purpose of purifying philosophy and Greek literature, which was become fashionable among the Romans. While he was in that city he was noticed by Brutus, who took him into his army and made him tribune; but Horace was more distinguished by his wit than illustrious for his person at the battle of Philippi he is said to have thrown away his shield and fled. He was now reduced to great difficulties, even to a state of indigence, having nothing to depend on but his literary talents. He recommended himself to Virgil, who obtained for him the patronage of Mecenas. To this patron of letters he rendered himself so agreeable that he made him his familiar companion, and took him to Brundisium, in that journey which he has so well described in verse. Mecenas procured from Augustus the restitution of Horace's estate, which he had forfeited by the part that he took in the war under Brutus, and introduced him to the emperor, who became greatly attached to him, and would have made him his private secretary, but the poet declined this high honour, preferring the independence of a private life to the business of a court.

Having no ambitious views, and detesting parade and splendour, he determined to remain his own master. In the latter part of his life he retired to the country, where he indulged himself in philosophical ease, which he has admirably described in his odes. He died eight years before the Christian era, and was buried near his friend and patron Mecenas, whose death is said to have hollowed his own. He appears to have had many friends among persons of rank, whom he addressed with easy familiarity, and he was ready to do friendly offices in the way of advice and recommendation. No ancient writer has been so popular as Horace: the variety of his manner, and of the subjects treated of, has rendered him the favourite of the most different tastes. His odes are models of that kind of composition in the Latin language. His Epistles and Satires abound in moral maxims expresed with vigour; in acute observations on human life, and in pleasant stories related with ease and vivacity. The Art of Poetry displays much found sense and good taste, but the precepts contained in it are defulory and without method. The bell editions of this author are those of Lips. 1752; and of Glasgow in 1744; but the impressions of Horace are so numerous as to defy enumeration. The translation by Francis is highly esteemed.

Hорадада, in Geography, a river of South America, which runs into the Caribbean sea; 50 miles E. of Cape Aguja.

Hорадни, a town of Austrian Poland, in Galicia; 60 miles N.W. of Zytomiers.

Hореа, ορεα, in Antiquity, solemn sacrifices, consisting of fruits, &c. offered in spring, summer, autumn, and winter, that heaven might grant mild and temperate weather. These, according to Mearius, were offered to the goddesse, called ωρια, i.e. Hores, who were three in number, attended upon the sun, presided over the four seasons of the year, and had divine worship paid them at Athens. Potter, Archæol. Græc. lib. ii. cap. 20, tom. i. p. 430.

Hорайдан, in Geography, a town of Peria, in Farisitan; 84 miles N.W. of Schiras.

Hораполь, or Horus Apollo, in Biography, an Egyptian grammarian, who taught fratis at Alexandria, and afterwards at Constantinople in the time of Theodosius. There remain of his, two books on the Egyptian Hieroglyphics, printed by Aldus in Greek, in 1505. They were afterwards translated into Latin, and several times reprinted. The bell edition is that of de Pauw, Gr. et Lat. with notes, Utrecht, 1727, 410.

Hорарий, something relating to hora, hours. See HOUR.

Horary Circle of the globe. See CIRCLE.

Horary Circles. See HOUR-circles and CIRCLE.

Horary Circles, or lines, in Dialling, are the lines or circles which mark the hours on sundials.

Horary
HOR

HORATORY Motion of the earth, is the arc it describes in the space of an hour.

This is nearly fifteen degrees; for the earth completes its revolution through 360° in a day, or twenty-four hours, and the twenty-fourth part of 360 is 15; though this is not the exact measure of the horary arc, because the earth moves with different velocity, according to its greater or lesser distance from the sun; but it is near enough for ordinary computations. See Equation of time.

HORATII, in Biography, the name of three brothers who distinguished themselves in the Roman history, and who fought against the three Curtiati of Alba in the year 667 B.C. Two of them were slain, but the third flew all his antagonists. On his return to Rome he met his fitter, who had been betrothed to one of the Curtiati, and reproaching him for what he had done, he flew her also. His great services to his country were considered as an extenuation of his crime. Univer. Hist. See Curtiati.

HORAWER, in Geography, a town of Hindooflan, in Bahar; 42 miles S.W. of Arrah.

HORAZDIOVITZ, a town of Bohemia, in the circle of Prachatiz, situated on the river Ottawa; 22 miles N.W. of Prachatiz.

HORB, a town of Germany, in the county of Hohenberg, situated on the Neckar, having a considerable trade in woollen goods; 28 miles S.W. of Stuttgart.

HORBY, a town of Sweden, in the province of Skone; 24 miles S.W. of Christianstadt.

HORCA, a river of Sweden, rising in the mountains bordering on Norway, and running into the Regunda at Lit, in Jamtland.

HORCAJADA, a town of Spain, in the province of Leon; 46 miles E. of Cidvad Rodrigo.

HORCAJO, a town of Spain, in New Castile; 27 miles S.S.W. of Hueta.

HORCAN, a mountain of Grand Bukharia, S. of Balk.

HORCUS LAPIS, the name of a stone mentioned by the writers of the middle ages as useful in folding silver and other metals. All the description they give of it is, that it was black, and was easily reduced to powder. It was called also catemis.

HORD, HORDA, a Tartar term, and literally denoting a multitude, in Geography, is used for a company or tribe of wandering people, which have no settled abode or habitation, but stroll about, dwelling in cariots, or under tents, to be ready to shift as soon as herbage, fruits, and the present province is eaten bare.

Hord is more properly the name which the Tartars, who inhabit beyond the Volga, in the kingdoms of Altracan and Bulgaria, give to their villages.

A herd consists of fifty or sixty tents ranged in a circle, leaving an open place in the middle. The inhabitants of each herd usually form a military company or troop; the chief whereof is commonly the captain, and depends on the general or prince of the whole nation.

HORDEATUM, a liquid medicine, made of barley, boiled till it burth.

Sometimes other ingredients are added, as the cold seeds, almonds, and the like.

HORDEOLUM, or STYX, signifies, in Surgery, a small tumour situated upon the edge of the eye-lid, and seldom exceeding a barley corn in size, from which it is customary the former appellation has been derived. According to Scarpa, flies originate particularly, often towards the inner canthus. A swelling of this sort is very circumcised, and presents itself either in an inflamed, or a suppurating state, or else as a mere indurated tumour, unaccompanied by inflammation.

An inflamed sty is commonly very red and painful, and bears a close resemblance to a little boil, or an indurated encysted tumour. Richter supposes, that a sty is sometimes one of the glands of Meckelius in a state of inflammation. The disease is in general quite of a local nature, although the circumstance of some persons being particularly often troubled with the complaint has given rise to suspicions of there being occasionally a constitutional or internal cause. Both Richter and Scarpa concur in imputing the frequency of styes in particular subjects to a foul disorder of the alimentary canal, induced by improper food, the abuse of spirits, &c. We will not pretend to decide concerning the truth of this statement, nor about the connection, which the first of these writers describes, as occasionally existing between the menes, the cure of the tinea capitis in children, &c. and the origin of styes.

The cure of an inflamed sty requires the employment of external emollient applications, or such as promote suppuration. The tumour always suppurates, and the sooner it is made to do so, the more quickly is the patient freed from all inconvenience. Attempts to disperse the swelling are, for the most part, unavailing, or if the inflammation is resolved, the sty is still left in an indurated state. When the tumour has already suppurated, it is also advisable to perfuse in the use of emollient remedies, and promote the discharge until all the hardenss is removed. An exceedingly troublesome induration is apt to remain when the suppuration has been checked too soon, especialy if the sty has been of large size. After the suppurative stage, a weak solution of acetate of lead will commonly serve for the dispersion of the remaining hard mass and swelling.

The indurated sty is usually nothing more than the remains of one, that has passed through the inflammatory stage, the suppuration having either been checked too soon, or prevented altogether by means put in practice for the resolution of the inflammation. The tumour becomes a cause of serious annoyance, partly because it often falls into a painful inflamed state, and partly because it obstrains the motions of the eye and eye-lids. It is even alleged, that the indurated sty may assume a malignant character, whence the swelling has been sometimes called febrifous. Richter states, that in this stage emollients and other applications do no good, and he advises the surgen to wait till the sty suppurately inflames, when suppuration is to be excited by some stimulat-
HOR

tutes the chief part of the disease. When the contents are
flow in making their escape, Scarpa advises piercing them
out.

Should a portion of fluidly matter remain in the swelling
a long while undetached, this eminent surgeon recommends
touching the inside of the sty with sulphuric acid a few
times, by means of a camel-hair pencil.

HORDEUM, in Botany, an ancient Latin name, of
whoever meaning or etymology we find no account or conjec-
ture worth transferring. Barley.—Linn. Gen. 29 Schreb.
Hoff. t. 499. Gerns. t. 81.—Clas and order, Triandra

Gen. Ch. Common Receptacle elongated into a spike,
pointed, brittle, compressed. Cal. Glumes lateral, three
plur, each of two narrow, pointed valves, containing
one sefiflue-flower. Cor. of two valves; the lower one
sefiflue, angular, ovate, pointed, longer than the calyx,
ending in a long straightawn; the inner valve lanceolate,
flat, minute. Stam. Filaments three, capillary, shorter
than the corolla; anthers oblong. Pist. Germen turbinate,
semowad ovate; style two, villose, reflexed; stigmas
feathery. Peric. none, excep. the permanent corolla, fall-
ing off with and containing the feed. Seed oblong, swelling,
angular, pointed at each end, above marked with a longi-
tudinal furrow.

Obf. In some species all the three flowers are perfect
in all their parts, and fertile; in others the lateral ones
are male, the central one only being hermaphrodite and fertile.

Eff. Ch. Common receptacle toothed and excavated. Cal-
lyx lateral, ternate, two-valved, single-flowered.

The species of Hordeum, ten in Wildenow, may be di-
vided into such as come under the common denomination
of corn, and such as aregenerally reckoned grasses. The
former are four; the latter five, and these last are of little
or no value, but rather detrimental to the farmer.

Lobs. 12. 28. (H. polydichium versum; Ger. em. 70.)—
Flowers all perfect, awned; two of the rows more erect
than the rest.—This is our common cultivated Barley, said
to have been found wild in Sicily and Ruffia. It is annual.
The flowers and seeds are disposed indistinctly in several rows,
with very long, compressed, rough awns. There is a tu-
poded variety, termed Hordeum calect, in which the husk, or
cochla, does not stick to the feed; and another with black
feads, said by Wildenow to be binomial.

H. breviglume. Linn. Sp. Pl. 125, has six rows of seeds;
H. diffusum, ibid. but two. The latter is figured in Ger.
em. 70. f. 1. It is much to be doubted whether there are
more than varieties

Ehrh. Herb. Exsicc. 13, has two rows of more crowded,
spreading, and longer seeds, which gives it a peculiar aspect.

Of the grassy species are

H. maritimum, so called from mus, musis, a mouse, and not
from maris, a wall, though it is usually named Wall Barley
in English, is gathered by way-of-rides. See its figure in
t. 1797.

Engl. Bot. t. 409, is known from the leaf by its perennal
root, taller upright fern, and by having all the calyx-glumes
narrow and bristle-shaped.

Bot. t. 207. (H. maritimum; Huds. 57.)—A sea-side grass,
very coloically distinguished by Hudson from H. mu-

HOR

rinum by the internal glumes of the lateral flowers being di-
lated and half ovate. It is also a more glaucous and smoother
plant, with more compact spikes. Curtis confounded it with
maritimum, and mentions it as known by the name of Squir-
rel-tail grass in the Isle of Thanet, where it is found very
pernicious, by sticking into the gums of horses, and rendering
them so foad as to prevent the animal's feeding.—There
three are the only British species of Hordeum; the second
of them, pratetis, is the nodum of Linnaeus, but he quotes
for it a synonyn of Dillenium in Ray's Synopsis, t. 20. f. 2,
which belongs to Aleceurus bulbofus.

Sibth. t. 73. Fl. Grec. t. 98, a native of the Levant,
has been by some confounded with the Linnaean nodum, but
is a larger and very distinct species. This is H. striatum.
Desfont. Atlant. v. 113. t. 37; and is also well figured in
Barrel. Ge. t. 112. f. 2.

For the culture and produce, &c, of barley, see BAR-
LEY. For the regulation of the price, see CORN.

HORDICALIA, or Hordicidia, in Antiquity, a reli-
gious feast held among the Romans, wherein they sacrificed
cattle with young.

The word hordicidia is formed of horda, which Feetus
explains by praegnum, pragnant; and ego, sacrificis. Ovid,
in his Fasti, lib. vi. ver. 631, describes hords or horda, to be
praegegnant; of Eovra, gravidus.

This feast fell on the fifteenth of April; on which day
they sacrificed thirty cows, big with calf, to the goddes
Tellus, or Terra, Earth, some of them were sacrificed in
the temple of Jupiter. The calves taken out of their
bitches were burnt to ashes first, by the pontifices; after-
wards by the eldest of the vestal virgins.

Alexander ab Alexandro, Gen. Dier. writes hordalio
dies; and from him, some of the moderns call the feast
horalia; but Varro wirtes it hordicida, and Feetus, hordi-
cidia.

HORDY, in Geography, a town of Hindoostan, in
Dowlatabad; 28 miles N. of Darore.

HOREB, in Scripture Geography, a mountain of Arabia
Petrea, so near to mount Sinai that Horeb and Sinai seem
to be two eminences of the fame mountain. Sinai lies east,
and Horeb west; so that when the sun rises, the latter is
covered with the shadow of Sinai. On Horeb there are springs
and fruit-trees, but only rain-water on Sinai. At Horeb
God appeared to Moses in the burning-bush. (Exod. iii. 1,
2, 3.) At the foot of this mountain Moses struck the rock,
and drew water from it. (Exod. xvii. 6.) Elijah retired
hither to avoid the persecution of Jezebel. (1 Kings, xix. x.)
It is frequently said that God gave the law at Horeb,
though in other places Sinai is named, because Horeb and
Sinai formed, as it were, one and the same mountain.

HOREBOUND, in Botany. See Marrubium.

HOREHOUND, Common white, Marrubium vulgare, in
the Materia Medica, is a plant which grows near the sides
of roads and rubbish, and flowers in June. The leaves have a
moderately strong smell of the aromatic kind, but not agree-
able, which is improved by drying, and by keeping for some
months is in a great part diffipated; their taste is very bitter,
penetrating, diffusive, and durable in the mouth. The dry
herb gives out its virtue both to watery and spiriduous men-
strua. The remaining extract, after infusping the watery
infusion, proves a strong bitter, without flavour; and that of
the spiriduous infusion is less in quantity, but of more pre-
 menacing bitteraes. This plant is the πρωτομ, the ancients,
who have extolled it much for its efficacy in removing ob-
strutions of the lungs and other vitia. It has been
chiefly employed in humoral affklmas, obistinate coughs,
and C pulmonary

Vol. XVIII.
pulmonary consumptions; instances also occur of its beneficial use in febrile affections of the liver, jaundice, cachexies, and mendral suppurations. However, though boarhound poisons some share of medicinal power, as may be inferred from its venenous qualities, its virtues do not appear to be clearly ascertained, and it is now only rarely prescribed by physicians. A dram of the dry leaves in powder, or two or three ounces of the expressed juice, or an infusion of half an handful of the fresh leaves, have been directed for a dose. The last mode is usually practised by the common people, who still recur to it as a favourite remedy in coughs and asthma. Taken in considerable quantities, it is said to loosen the body. Although, says Cullen, it has had the reputation of a pectoral, its virtues, in many trials, have not been observed, and in several cases it has been judged hurtful. Lewis Mat. Med. Woodv. Med. Bot.

HOREL, in Botany. See Stachys.

HOREHOUND, Beaf, in Botany. See Sideritis.

HOREHOUND, Black, or Stinking. See Ballotés.

HOREHOUND, Stinking marj. baflard, See Glechoma.

HOREHOUND, Water. See Lycocones.

HOREM, in Scripture Geography, a city of Naphthali. Josh. xix. 38.

HORESTI, in Ancient Geography, a people of Scotland, mentioned by Tacitus, in Agricola's time, the inhabitants of Angus, but probably incorporated with, or subdued by, the Pescambrics, before Ptolemy wrote his geography.

HORGEN, in Geography, a town of Switzerland, in the canton of Zurich; 10 miles S.S.E. of Zurich.

HORIA, in Entomology, a Fabrician genus of coleopterous insects, pseulping the following character. The antenna is moniliform: feelers four, thicker towards the tip; lip linear, and rounded at the end.

The body of the horia is long and cylindrical; the head large and inclined, feutal small and triangular; wing-cases curvaceous and flexible; wing membranes, and all the feet armed with four claws. The horia are allied to the cantharis, mylabris, and melo genera, and also to the new genera cecujus and lynexylon. The genus was first established in the Fabrician Mantilla Inflorum for the reception of the Linnaean cantharis demodii; but which being esteemed distinct from the cantharides, his horia denominated, for that is the name under which it appears in the work above mentioned, was afterwards consigned to the lynexylon (see Ent. Syll.), and the same generic name given to another family; that denominated horia by later writers. The genus horia, thus established, contains only two species, one of which (tefaea) Fabricius had himself described in his Mantilla, under the title of cecujus flavipes, and the other is the canthus maculatus of professor Swederus, an account of which is inferred by that author in the Transactions of the Royal Society of Stockholm.

Horia is a genus adopted by Olivier, who describes the species maculata. Latreille, however, seems to think the two Fabrician species are not generically the same, the head and thorax in one being much larger in comparison to the rest of the body in the species maculata than tefaea. Upon this opinion, suggested by Latreille, it is remarked by Olivier that we are not at present sufficiently acquainted with the structure of the mouth, to speak with certainty; and he himself forbears from offering any opinion; and we further observe that in the latest publication of Latreille, he admits the first at least of the Fabrician species under the generic name of horia. The transformations of the insects of this family are entirely unknown.

MACULATA. Yellowish; wing-cases with seven black spots. Fabr. Horia maculata, Olivier. Cecujus maculatus, Swederus.

Length about an inch and a half. The species inhabits South America.

TESTACEA. Rufous; antennae and legs black. Fabr. Native of Tranquebar. The posterior thighs of the male insect thick.

HORJA, in Geography, a town of Sweden, in the province of Schonen, 32 miles N. of Christiandstadt.—Alfo, a town of Sweden, in Well Gotland; 20 miles N.N.W. of Junkoping.

HORITES, in Scripture Geography, an ancient people, who dwelt in the mountains of Soir, beyond Jordan. Gen. xiv. 6. They were powerful, and had princes of their own, before Esau conquered their country. Afterwards they and the Edomites feem to have formed one people. They dwelt in Arabia Petraea and Arabia Deserta, S.E. of Judea. Deut. ii. 1. xxiii. Judg. v. 4. The Hebrew שופר, Chorim, translated Horites in Genesis, is used appellatively in other passages of scripture, to denote heroes, or great and powerful men; and probably the Greeks derived from this term their heroes, as they derived anness, a king, from the fons of Anak. See 1 Kings, xxii. 8. 11. Neh. ii. 16. iv. 17. vi. 17. vii. 5. xiii. 17. Pec. 1. 17. 16. xxxiv. 21.

HORIZON, or HORIZON, in Astronomy, a great circle of the sphere, dividing the world into two parts, or hemispheres; the one upper, and visible; the other lower, and invisible.

The word is ἀνόγεια, which literally signifies bounding, or terminating the light; being formed of ἀνόγεια, terminating, seat, I bound, I limit; whence it is also called sinan, sinifler.

The horizon is either rational or apparent.

Horizon, Rational, True, or Astronomical, which is also called simply and absolutely the horizon, is a great circle, whose plane passes through the centre of the earth, and whose poles are the zenith and nadir. It divides the sphere into two equal parts or hemispheres.

Such is the circle H R (Plate XVI. Astronomy, fig. 141) whose poles are the zenith and nadir; whence it follows, that the several points of the horizon are a quadrant distant from the zenith and nadir.

The meridian and vertical circles cut the rational horizon at right angles, and into equal parts. These, Sinful, Visible, or Apparent, is a lesser circle of the sphere, as h, r, which divides the visible part of the sphere from the invisible, and whose plane touches the spheroidal surface of the earth.

Its poles, too, are the zenith and nadir; and consequently, the sensible horizon is parallel to the rational; and it is cut at right angles, and into two equal parts, by the verticals.

The sensible horizon is divided into eastern and western.

Horizon, the Eastern, or Oritive, is that part of the horizon wherein the heavenly bodies rise.

Horizon, the Western, or Occidental, is that wherein the stars set.

Horizon, in Geography, is a circle passing over the earth, and dividing the visible part of the earth and heavens from that which is invisible.

The altitude or elevation of any point of the sphere, is an arc of a vertical circle, intersected between it and the sensible horizon.

This is peculiarly denominated sensible or apparent horizon, to distinguish it from the rational, or true, which
The distance on a perfect globe, if the visual rays came to the eye in a straight line, would be as it has been now stated; but by means of the refraction of the atmosphere, distant objects on the horizon appear higher than they really are, and may be seen at a greater distance, especially on the sea. Thus, without refraction, the most distant part of the sea visible to the eye at B would be A; but refraction elevates the parts of the sea, which are farther from the eye than A, so that the tangent or visual ray shall fall upon a more distant point, as H, and consequently the extent of the visible horizon is enlarged by refraction: for it is DH instead of DA; and refraction makes the angle of depression less than it would be, viz. HBF, instead of ABD.

Father Laval, professor of hydrography at Marselles, found, that the horizon of his observatory toward the sea was never more than 15 minutes, nor less than 13; that is, the arc of the circumference of the earth, intercepted between the observatory and the horizon, fluctuated between those two quantities; whence M. Caffini deduces, that the extent of the horizon is seven French leagues, of three miles each; and that the observatory is 175 feet high.

The height of the horizon, at the same place, and the same elevation above it, is very subject to vary, by means of differences in the atmosphere, which occasion others in the refractions.

When the sea was full, or the north-west or south-west wind blew, and the air hazy about the horizon, F. Laval always found his horizon deprefred, or lower, i.e. the refraction which should raise it in that case was less than ordinary. And yet, on the common principles, the air being now much charged with vapours, the very contrary was rather to be expected. This makes M. Caffini suspect that there is some other refractive matter in the atmosphere, beside the air itself.

The same author observes, that at a height ten times greater than that of F. Laval's observatory, he found the arc terminated by the horizon toward the sea, 42', without any sensible variation; whence he concludes, that the variations are the greater, as the height is the less; which may seem contrary to what he had ascertained in another place, viz. that the variations in the apparent altitudes of bodies are greater, as these objects are more remote, because they are seen through the larger quantity of air, which is liable to be varied. But the contradiction may be solved.

HORizont of the Globe. See Globe.

HORIZONTAL, something that relates to, or is taken in the horizon, or on a level with the horizon.

HORIZONTAL Dial, is that drawn on a plane parallel to the horizon; having its gnomon, or style, elevated according to the altitude of the pole of the place it is designed for.

Horizontal dial are of all others the most simple and easy. The manner of describing them, see under the article DIAL.

HORIZONTAL Distance. See Distance.

HORIZONTAL Line, in Perspective, is a right line drawn through the principal point, parallel to the horizon; or it is the intersection of the horizontal and perspective planes.

Such is the line PL (Plate I. Perspective, fig. 3) passing through the principal point P.

HORIZONTAL Line, or base of a hill, in Surveying, a line drawn on the horizontal plane of the hill, or that on which it stands.

HORIZONTAL Mean. See APPARENT Magnitude.

HORIZONTAL Parallax. See PARALLAX.

C. 2
Horizontal Plane, is that which is parallel to the horizon of the place, or not inclined to it.

The busiefs of levelling is, to find whether two points be in the horizontal plane; or how much the deviation is. See Levelling.

Horizontal Range, or level range, of a piece of ordnance, is the line it describes, when directed parallel to the horizon, or horizontal line.

Dr. Halley gives two very ready theorems: the one, to find the greatest horizontal range at 45 degrees elevation, in any shot made upon any inclined plane, with any elevation of the piece whatever; and the other, to find elevations proper to strike a given object with any force, greater than what is sufficient to reach it with the middle elevation.

1. A shot being made on an inclined plane; having the horizontal distance of the object it strikes, with the elevation of the piece, and the angle at the gun between the object and the perpendicular; to find the greatest horizontal range of that piece laden with the fame charge; that is, half the latus rectum of all the parabola made with the same impetus. Take half the distance of the object from the nadir, and the difference of the given elevation from that half; subtract the vertical line of that difference from the vertical line of the distance of the object from the zenith; the difference of those vertical lines will be to the line of the distance of the object from the zenith, as the horizontal distance of the object is to, the greatest range at 45 degrees.

2. Having the greatest horizontal range of a gun, the horizontal distance and angle of inclination of an object to the perpendicular: to find the two elevations necessary to strike that object. Halve the distance of the object from the nadir; this half is equal to the half sum of the two elevations sought; then, as the angle of inclination, so to the horizontal distance of the object, as the sine of the angle of inclination, or distance of the object from the perpendicular to a fourth proportional; which fourth being subtracted from the vertical line of the distance of the object from the zenith, leaves the vertical line of half the difference of the elevations sought; which elevations are therefore had, by adding and subtracting that half of the difference to and from the aforesaid sum. See Projectile and Gunery.

Horizontal Refraction. See Refraction.

Horizontal Roots. See Fibrose roots.

Horizontal Shelters, among Gardeneurs, are defenses, diposed parallel to the horizon, for tender plants, blossoms, and fruits, in the spring, to defend them against blasts, and pinching nights.

The usual shelters that have obtained are bass mats, and other warm coverings, which are rolled up in the day-time, and let down in the night. It was the reverend Mr. Lawrence who first proposed horizontal shelters, chiefly on this principle; that most of our frosts and blasts fall perpendicularly, i.e. the condensed vapours, falling from the upper region, do at night form themselves, toward the surface of the earth, into drops of dew, subject to be frozen by the coldness of the air.

Horizontal shelters are to be made by laying rows of tiles, at certain distances one above another, in the structure of the wall, so as to project or hang over the plane of the wall, to carry off the dew, wet, &c. It is an inconvenience, objected to this method, that it is difficult to lead a tree rightly among the tiles, or to keep its figure duly filled up.

But the principal objection against these tiles is this, that they prevent vegetables from receiving the advantage of dews, rains, &c. in consequence of which they become weak and languid, and at last entirely decay. The only fort of horizontal shelters, which Mr. Miller has ever observed to be useful for fruit-trees, are made with two leaves of thatch, joined over each other, and painted. This kind of shelter, being fixed upon the top of the wall with pullies, to draw up and down at pleasure, forms a sort of pant-houfe, which being let down in great rains or cold nights, whilst the trees are in flower, or the fruit is setting, proves serviceable; but it must be removed soon after the fruit is set, so that the trees may enjoy all the advantages of rain, dew, &c. in the summer, which are absolutely necessary for producing healthy trees, or good fruit.

Horizontal Speculum. One of the great inconveniences mariners have to struggle with, is the frequent want of a horizon; for though the atmosphere may, at the height of 10 or 12 degrees and upwards, be clear enough to give a view of the fun and other objects, yet all below that height is often so hazy, as to hinder a distinct sight of the horizon, and consequently to prevent observations from having the requisite correctness. This inconvenience is removed by a horizontal speculum, invented by Mr. Serfon, who was lost in the Victory man of war, in which ship he was sent out to make trial of his machine.

The principle on which this machine was contructed, was derived from the consideration of a top while spinning: for this author observing that the top had a considerable degree of steadiness in, and force to acquire, an upright motion, whether the body which sustained it was in motion or at rest: he therefore concluded, that if a circular machine, whose upper face was a flat polished speculum, was to have a swift circular motion communicated to it, that speculum, by acquiring a horizontal situation, would throw all objects which it reflected, as much below the horizon, as they really are above it. Consequently, if the image of the fun, as seen reflected from the speculum, were made to coincide with the fun's image seen in a Hadley's quadrant, the angle given by the quadrant would in all cases be double the real altitude.

Mr. Serfon also found, that to confine the speculum to one plane, it was necessary to let the point spin in a cup; for the horizontality of the speculum would not be altered, whatever position might be given to the cup; provided it touched only at the point on which it spun. This curious and useful instrument, as it is now improved by Mr. Smeaton, consists in a well polished metal speculum, of about three inches in diameter and a half in diameter, inclosed within a circular ring of brass; so fitted that the centre of gravity of the whole shall fall near the point whereon it spins. This is the end of a steel axis running through the centre of the speculum, above which it finishes in a square, for the convenience of fitting a roller on it, by which it is set in motion by means of a piece of tape wound round the roller. The cup in which it spins is made of agate, flint, or other hard substance; and a pyramidal cover may be made to the whole, composed of glass plates; by this means the observation may be made with it as well covered as open, and it will thereby be prevented from tarnishing by the moisture and spray of the sea.

If the box be placed readily, and as level as may be, after the tape is unwound, the speculum will be set for observation in less than two minutes, and will generally continue so for twelve or fifteen. When it is to be used for a meridian observation, it may be convenient to know what time to set it up; and this may be had near enough by taking the sun's bearing from the meridian with an azimuth compass, allowing for the variation; and if it has about five degrees to run before
it culminates, it is then time to spin the speculum; The observer is to place himself as near the box as he conveniently can, and look down on the sun's image in the speculum, and bring the sun's image near to the quadrants to agree with it, so that their centres coincide; the quadrant will then give the double altitude, without any allowance for the height of the ship, or the sun's semi-diameter.

When the sun is about 45° high, the observer must look through that light of the quadrant, which is used for a back observation: but he must look down on the horizontal image, or that in the speculum, as if it was the back horizon; and then making the polar images to agree, the quadrant, according as it is numbered, will give the double altitude, or double zenith distance.

These speculums are as useful by night as by day: for as the images of the smallest stars may be seen in the speculum, consequently any object that can be seen reflected from the glases of the quadrant, may be observed by the speculum; and there are all the stars of the first magnitude, the planets Venus, Mars, Jupiter, Saturn, and the moon. So that by having the declinations of these bodies in an epemeris, they may be used in observations as well as the sun.

As the sun diffuses to which ships are sometimes driven in several parts of the world, for want of a horizon to observe by, are by this ingenious contrivance quite removed, it is hoped the use of this instrument may become general. See HADLEY'S QUADRANT.

Horizontal Distances, in Natural History, are terms applied to the thin plates which ciotb the tubes or slipsheets of some corals at right angles, and connect them together, of which the tubipora mutica (figured in Ellis, tab. 27.) is an instance.

Horizontal Face, in Crystallography, is used by Haüy in describing secondary forms of crystals, the axes of which are supposed vertical, and then the faces perpendicular to these will be called horizontal faces, those parallel to the axes being called vertical faces.

Horizontal Strata, in Geology. It seems best to agree with the phenomena of the strata of the earth, as well as with the opinions of the greater number and most able of the writers on the subject, to consider the strata as having been originally concentric with the earth, and entire, and, of course, horizontal in every part. (See Concentricity of Strata.) Considerable tracts of strata are found yet in nearly a horizontal position, the red marl, for instance, on the south and south-west of Derbyshire. (See Mr. Fary's Report to the Board of Agriculture, vol. i. p. 147.) Dr. Charles Anderson, in his "Appendix to the Translation of Werner's New Theory of Veins," p. 256, remarks, that the widest mineral veins occur in horizontal strata, which seem confirmed in Derbyshire, by the very wide veins of spar, void of metallic ores, which obliquely cross Dove-dale on the confines of Staffordshire, in the fourth lime-flint rock, which lies horizontal, or very near it, in these parts.

HORLA, in Geography, a town of Norway, in the diocece of Dronthen; 48 miles W.S.W. of Romdal.

HORLOFA, a town of Sweden, in the province of Skone; 11 miles E. of Lund.

HORMAH, or Hormah, from ספוח, signifying the fame with Amathus, in Scripture Geography, a town of Palaestine, belonging to the tribe of Simeon. It was called Zephal before the Hebrews called it Hormah, the occasion of which appellation was, that the king of Arad, a Canaanite, S. of the land of promise, attacked the Hebrews, put them to flight, and depopulated them of a rich booty; upon which the Israelites engaged themselves by vow to destroy every thing belonging to the king of Arad; a purpose which probably was not executed till after Joshua entered the land of promise. See Josh. xv. 30.

HORMEZION, or Hormestion, in Natural History, the name of a gem described by Pliny, and seeming to have been a species of hyacinth. He says it was very bright, and of a yellowish-red, or flame colour, with a whitish call at the edges.

HORMILLOS, Los, in Geography, a small island in the Pacific ocean, near the coast of Peru. S. lat. 16° 45'.

HORMINODES, in Natural History, the name of a gem described by Pliny, and others of the ancient writers. The stone itself, they tell us, was either black or white, but had in it a green fleck surrounded by a circle of a bright yellow. It seems to have been no other than one of the oculus bells of our jewels.

HORMINUM, in Botany. See Melissa and Salvia.

HORNISDAIS, or Hormus, king of Persia, in Biography, succeeded to the throne A.D. 579, after the death of his father, the great Chosroes. He had, during the life of his parent, obtained some military reputation, and while directed by the influence of prudent counsellors, he governed his dominions wisely, but when left to himself he exhibited in his character and conduct a number of vices, and displayed the utmost folly and tyranny. Not fewer than 13,000 victims of all ranks are said to have fallen, by his order or consent, under the sword of the executioner. His cruelty produced hatred, and hatred terminated in rebellion. In this state of things, the khan of the Turks invaded the eastern provinces with a vast army, while the Romans renewed hostilities on the opposite side. The Persian empire would have been subverted had it not been for the valour and talents of Bahram, or Varanes, who gave the Turks a signal defeat. The successful general, in one instance, was himself defeated by the lieutenant of the emperor Maurice, and Hormisdas had the folly and injustice mortally to affront him by the present of a dilapidated and a suit of women's apparel. He was bent on revenge, appeared before his troops in this garb, and found no difficulty in refusing them to rebellion; the revolt became general, and, in the confusion, Bindoes, a prince of the blood, who had been imprisoned by Hormisdas, was liberated by his brother. He came to the royal palace at Ctesiphon, where the monarch was sitting in all the pomp of royalty, and began to upbraide him for his tyranny and misconduct. Hormisdas ordered his attendants to seize him; but, overawed by the regard of BINDOES, they were inattentive to the royal command, and stood patiently by and saw the king dragged from his throne into prison, where he was first deprived of his sight, and then of his life. Whether the king was assassinated, or died by less violent means, is not easy to ascertain. He died in the year 599, after a reign of twenty-one years.

HORNISDAIS, pope, son of a person named Julius, and a native of Frufino, in Campania, was elected to the pontificate upon the death of pope Symmachus, in the year 514. One of the most prominent circumstances that occurred during his elevation to the papedom was the death of Anastasius, who was succeeded by Julius. The new emperor, though perfectly illiterate, was most zealously attached to the doctrine of the two natures. His promotion, therefore, gave the highest satisfaction to the orthodox throughout the empire. In Constantine the populace distinguished themselves for their zeal in the Catholic cause, by compelling the patriarch to receive the council of Chalcidon, and to anathematize publicly all those who had rejected the decrees of the synod. He also promised to have what he had done confirmed by a council. A council was accordingly assembled, in great haste, to gratify the impatient and riotous multitude. The
HOR

The act of this body in behalf of the Catholic faith were approved and confirmed by the emperor, who issued an edict, commanding all bishops within his dominions to conform to them, on pain of forfeiting their fees. This decree was soon followed by the execution of such of the Eutychians as were most obnoxious to the orthodox party. By these means of conviction, the bishops of the East were speedily brought to unite in the profession of the Catholic faith, and the emperor undertook, in the next place, to unite them with their brethren in the West. This subject occupied the pope till his death, in the year 529, after a pontificate of nine years. Many of his letters are extant. Bower.

HORMONT, in Geography, a town of Peria, in the province of Larifian; 33 miles E.N.E. of Lar.

HORMUS, in Ancient Muses, was a dance of a gay kind, for girls and boys, in which the boys took the lead, putting themselves in manly and military attitudes, the girls following in gentle and modest steps, harmonizing the two virtues of force and temperance.

The Greek girls of good families assembled in troops, ornamented with nosegays, garlands, and chaplets of flowers; they afterwards went to the temples, singing hymns at the solemn festivals, or at the nuptials of some one of their companions.

The Lacedæmonian dance consisted of three parts, representing the three ages of human life. All singing at the same time.

Age - We have been valiant.
Youth - We are to be present.
Infancy - We shall be so in our turn.

HORN, Corru, a hard, callous substance, growing on the head of divers cattle, and serving them as weapons of offence and defence.

Horns, in Comparative Anatomy. The parts which receive the name of horns are dissimilar in form and structure. They admit of being divided into four kinds at least: the 1st are found on the rhinoceros; the 2d are those of the ox, antelope, goat, and sheep; the 3d belong to the canelopard, and the 4th to the deer kind.

The horns of the rhinoceros are those most properly so called, being entirely composed of a horny substance. They are situated not upon the os frontis, but the narial bones. They are of a pyramidal shape, and have no attachment to the skull but at the surface of their bases. They appear to be made up of a number of fibres resembling brown hairs consolidated together, and rendered smooth upon the surface, except around the base, where the external fibres, being broken off, present the appearance of a bristle.

A number of pores, or foramina, are to be seen upon the base of the horn, into which fine vasaular procresses are probably received; for, from the structure of the horn of the rhinoceros, there is every reason to suppose it is formed upon the pulp, in the manner of hair. (See Hair.) These foramina are the orifices of fine canals, or grooves, which pass longitudinally throughout the horn. Cuvier states, that in the rhinoceros unicornis there is a thick muscus interposed between the horn and the bone on which it is situated, and that in the rhinoceros bicornis the horns are connected with the skin only, and, therefore, they are in some degree movable. The horns of the rhinoceros are not deciduous, but continue to increase from the root, or base, in proportion as they wear.

Horns of the 2d sort are the most common; they belong to many of the ruminating quadrupeds, and some birds have similar procresses upon their heads. They consist of three parts, an offaceous substance, a vasaular investment, and the external flesh. The bone is the part which is first formed; it may be discovered at a very early period as a knob, or round protuberance, movable upon the os frontis, and covered with the common integuments: as it elongates, the skin covering it becomes callous, and appears to wear off when the offensive process is found to be clothed in a red cafe of horn. It then becomes fixed to the os frontis by adhesions. The original period of the horns becomes thicker and fatter, and its vessels increase in size and number, preparatory both to the growth of the offensive, and the external parts of the horn between which it is interposed, and to both of which it serves as the organ of nutrition. The internal or offensive portion of the horn, even when fully formed, is irregular in its texture, resembling more an offensive deposit from inflammation than natural bone.

The external cafe of the horns in the goat and sheep is somewhat different from that of the ox and antelope; in the latter the horny fibres appear long and continuous, and form close compact layers. Incased the one within the other; but in the goat and sheep they are interrupted by many transverse grooves, are shorter, and have the appearance of imbricated layers of horn.

The growth of the horns is in the roots, in the manner of hairs, but it does not appear to go on continuallly, or without interruption; for the increase in each year is marked by a circular groove near the root of the horn, by which means the age of the animal can be often determined.

Horns of the 3d sort are the short square processes upon the head of the canelopard; these consist of bone, which is of a porous spongy texture; they are united to the os frontis by anchylolysis at their base, and the other extremities produce regular convex knobs; the flem and pedicle of these horns are merely covered by the common integuments; but the bulb on the ends is covered a number of strong short hairs, which do not grow in a similar manner, and are every way analogous to the fibres composing the horns of the rhinoceros.

Horns of the 4th kind are peculiar to the deer g nus, (cerus); these are composed entirely of bone, and have, therefore, been described, along with the other bones, by Cuvier and other anatomists; we shall, however, find from their history, as well as situation, that they distinctly belong to that class of bones which enter into the composition of horns in general.

The horns of deer are shed and reproduced annually, their growth therefore is exceedingly rapid. Their first appearance is in the form of two small cartilaginous knobs or buttons under the skin. These proceed to develop their different branches or divisions in succeccion, till clothed with what has been called their velvet coat. This integument consists of the skin covered with a delicate soft hair, and the periosteum closely united together. The velvet covering is extremely vascular; many of its vessels acquire an extraordinary magnitude. We have seen them in the flag during the growth of the horn as large as the quills of a goose, and Cuvier states them equal the size of the little finger. When the horns are completely formed, the velvet coat loses its vascularity, becomes inelastic and dry, and is rubbed off by the deer, leaving the horns, in the hunters’ phrase, burnished.

The horns of deer acquire from friction a degree of polish upon the surface towards the top, but nearer the root, they still retain the impressions of the large vessels that were employed in their secretion. The bone of which they are composed is dense and hard upon the external part, and more light and porous in the interior, although it is without cavity or medullary cells.

The original cartilaginous buttons or rudiments of the horns are sustained upon eminences of the os frontis, with which they form the fame fort of union that exists with respect
Horns refer to the epiphyses of bones, being at first loose and afterwards firm. The line of their union is indicated by a circular notched protuberance upon the base of the horn, which is called the burl.

When the horns are about to be cast, there appears, upon sawing them in a longitudinal direction, a reddish mark of separation between them, and the eminences of the frontal bone on which they are fastened. This mark becomes more apparent, and at last the coloction: between the horns and the skull is so much destroyed, that the shaft makes them fall after the horn is fixed. The eminence of the os frontis presents the appearance of a bone sawed or broken across. Its proper substance is actually exposed, but it very soon becomes covered by the integuments.

The bones which constitute the horns of the deer appear to be entirely analogous to the ossaceous parts of the horns of the other ruminant quadrupeds, and only differ from them in the circumstance of being deciduous. The horns of the rhinoceros, and those of the deer, should be considered as the two extremes in the history of these organs. The one wants the ossaceous basis, the other the cornaceous covering. The horns of the camelopard and ox, &c. exhibit the examples of intermediate structure.

The formation of the horns has been long known to be much influenced by the condition of the organs of generation. They are sometimes peculiar to the sex animals, and in the deer kind acquire their full bulk and complete form just before the season of rutting, after which they are fixed. Dr. Richard Ruffell, in his "Economy of Nature in Diseases of the Glands," relates some curious effects on the growth of deer’s horns from castration. He castrated a very young deer, the consequence was, the horns did not grow. He then took another deer, some months older, and castrated it. A little velvet bud arose on one side of the head instead of a horn, and an irregular velvet horn about six inches long grew on the other; both were cartilaginous, and neither had liability enough to stand upright. He next had a deer somewhat older than the last castrated, but not cut clean, as they term it. The event was this; he had two moist irregular horns, that never call their veil, and the left tenticule and spermatice cord being least spoiled, the left horn was one-third longer than the right. Nature, not being able to carry on the growth in the regular way, threw out from the sides of the horns some bony knots, from which hung soft penile glands, (as he termed them,) that were covered with velvet, and resembled bunches of grapes. Lastly, he castrated two old bucks at the end of February, and their horns dropped off the 21st of March following, so that this event was anticipated five weeks at least. Their horns were however renewed the next year, and were longer than those of the other bucks of the same age; but the branches were left in length and size, and neither the velvet covering or the horns themselves were ever cast afterwards. See Economy of Nature in Acute and Chronical Diseases of the Glands, by Doctor Richard Ruffell, p. 21.

The effect of castration is also strikingly to be seen in the different kind of horns in the bull and bullock. In the latter, the growth of the horn seems to be unlimited, but this depends upon the increase of the ossaceous part, for the cornaceous sheaths are so thin and imperfectly formed, that they are only fit for the coarser articles of manufacture. It is probable, that if castration could be performed early enough in these animals, it would prevent the growth of horns entirely, as in other cases.

For the explanation of the structure and mode of growth of horns, see the plate on Comparative Anatomy, including the representations of hair, horns, spines, &c. Fig. 9. is a view of the horn of the rhinoceros unicornis, a, the body of the horn; b, the bristled appearance around the root; c, the surface by which it is connected with the head covered with minute hairs. Fig. 10, is the button or rudiment of the stag’s horn, after a fortnight or three weeks growth. Fig. 11. is the horn some weeks farther advanced with several of the branches forming. The horn is still soft and cartilaginous, and covered by its velvet coat. Fig. 12. is a dissected view of a portion of the horn in an early state, to shew the nature of the velvet coat: a, the skin clothed with thick close hair; b, the petroleum thickened and vascular, and not closely adhering to the bone; c, d, e, some of the large branches of the blood-vessels that nourish the horn removed. Fig. 13 is the deer’s horn fully grown; the remains of the velvet coat are seen hanging in threads, which the animal nibs off against the trees in the course of a day or two. Fig. 14. exhibits the socket upon the eminence of the os frontis, left by the separation or casting of the horn. Fig. 15. shews the effect produced upon the horns from imperfect calibration in a young deer, as described and delineated by Dr. Ruffell.

Horns have been called the head of the deer by huntsmen. See Head.

In the History of the French Academy of Sciences, we have an account of a bullock’s horn dug out of the ground in ploughing, which had shot forth fibrous roots, and appeared to have grown, or vegetated after the manner of a plant.

Horns make a considerable article in the arts and manufactures. Bullocks’ horns, softened by the fire, serve to make lanterns, combs, knives, ink-horns, tobacco-boxes, &c.

Horns, when properly reduced by mills or other means, are also found to be excellent as a manure for some sorts of land, where they can be procured in sufficient quantity for the purpose. They are used occasionally in Hertfordshire, and some of the other counties in the vicinity of the metropolis, on the tilage as well as the grass lands, with considerable success. See Horn Shavings.

Horns, in Chemistry, have been analyzed, and found to contain a very small quantity of earthy matter. Mr. Hatchett burnt 500 grains of ox horn, and the refiduum was only 1½ grain, and not half of this was phosphat of lime. Horns chiefly consist of a membranous substance, which possesses the properties of congealed albumen, and they probably contain a little gelatine. The horns of the hart and buck are exceptions, as they possess the properties of bone, and are composed of the same constituents. See Bone.

Horns, in Rural Economy, the well known ornaments which spring out from the heads of different sorts of cattle, sheep, and some other sorts of live stock. It is by the horns that the breeds of many of these sorts of animals are known and ascertained. As the nature of such excrecences must obviously be productive of much offal and waste about the parts in which they are situated, it must of course be a great object of the breeder to get quit of them as much as possible, by the encouragement of the polled kinds, and the proper crossing of them with the other sorts where necessary. See Breed and Breeding.

Horn, in Geography, a town of Sweden, in East Gothland; 52 miles S. of Linkoping.

Horn, or Hoorn, a town of Austria, famous for its beer made of oats, which supphes all the principal towns of Austria; 40 miles N.W. of Vienna. Lat. 48° 37’. Long. 15° 34’.

Horn, a town of Welfphalia, in the county of Lippe, near
HOR
near which is a plain, called " Vinfield, or the Field of Victory," supposed to be the place where Varus perished. N. lat. 51° 56', E. long. 8° 52'.
Horns, the island on the coast of West Florida, between Ship and Maffaire islands; nearly 17 miles long, and about half a mile wide.
Horns's Island, a small island near the coast of South Carolina. N. lat. 33° 7', W. long. 79° 17'.
Horn, Cape, a cape on the south coast of Terra del Fuego, or the most southern extremity on a group of islands of unequal extent, lying before Naffau bay, known by the name of Hermitage islands, and situated in S. lat. 55° 58', and W. long. 67° 46'. This cape is known at a distance by a high round hill over it. On the N.W. side are two prakled rocks like sugar-loaves; they lie N.W. by N. and S.E. by S. by the compass, of each other. Some other straggling low rocks lie W. of the Cape, and one S. of it; but they are all near the shore. From Christmas Sound to Cape Horn, the course is E.S.E. 4 E. distant 31 leagues. Between this cape and another called " Falsie or Midtaken Cape," by Captain Cook, there seemed to be a passage directly into Naffau-bay; some small islands were seen in the passage; and the coast, on the W. side, had the appearance of forming good bays or harbours. Captain Cook observes, though the doubling of Cape Horn is so much dreaded, so that, in the general opinion, it is more eligible to pass through the strait of Magellan, we were not once brought under our close reeck topsails, after we left the strait of Le Maire. He doubled the cape in 33 days, whereas it would have taken much longer time to have failed through the strait of Magellan, with greater fatigue to the sailors, and greater damage to the anchors, cables, fai's, and rigging of the ship. He thinks, that different circumstances may at one time render it eligible to pass through the strait of Le Maire, and to keep to the eastward of Staten-Land at another. He also recommends, if neither wood nor water be wanted, to make no port and not to come near the land at all; for by keeping out at sea, you avoid the currents, which, in his opinion, lose their force at 30 or 36 miles from the land, and at a greater distance there are none.
Horn, Cape, (Falsie), a rocky point, which is the southern point of the easterneast of Hermitage islands, three leagues E.N.E. from Cape Horn. Off this cape lie rocks that are white with the dung of fowls; and vast numbers were seen about them.
Horn, in the Manege; to give a stroke with the horn, is to bleed a horse in the roof of the mouth, with the horn of a flag or roebuck, the tip or end of which is so sharp and pointed, as to produce the fame effect as a lance. They strike with the horn in the middle of the fourth notch or ridge of the upper jaw.
Horn is also a sort of musical instrument, of the wind kind; chiefly used in hunting, to animate and bring together the dogs and the hunters.
The horn may have all the extent of the trumpet.
The term for foun dig anciently was, wind a horn; all horns being in those times compassed; but since straight horns are come in fashion, they say, blow a horn; and sometimes, plainly found a horn.
There are various lessons on a horn; as the recheat, double-recheat, royal recheat, running or farwell recheat, &c. See RECHEAT.
Horns. The horns and instruments of this name and form are as numerous and various, as the animals that nature has armed with this weapon. The principal instrument, however, under that denomination, is the French horn, cor de chasse, hunting horn, or coroa da caccia, which is not only useful in the field, but of capital utility in full pieces, facred and secular, in every orcheftra.

The horn is a long tube, narrow at the top, and encreafing in diameter to the end, where its mouth is very wide. It is curled up in a ring or rings, for the convenience of carriage and performance.

It has no holes or keys with which to form different tones; the whole scale is produced by different modifications of the breath at the mouth-piece, by the lips and tongue.

It has the fame series of notes as the trumpet, only an octave lower. All the mute that is composed for it, is written in the key of C, and its pitch is altered now to any other key by crooks. At the beginning of a movement, the key is indicated by one of the seven letters of the gammut; as D horn, E6, F, or G horn, &c. Its natural scale is a regular series of eight notes with the addition of an occasional sharp 4th, and the harmonics of the key below.

Attempts at chromatic horns have been made early in the last century, in Germany; the Melting were the first who pretended to perform in all keys in England, about the year 1740. Spandau, from Holland, was the first that was able to make the artificial notes agreeable, about 1772, and soon after, Ponto did wonders on this instrument. We have now (1803) four excellent performers on the horn, the Leanders and Petrides. These last have the art of echoing passages in such a manner as to seem at a great distance without quitting their place in the orchestra. It must, however, be discovered by every discriminating hearer, that the factitious half notes, that are made by the hand in the mouth of the instrument, are founds of a different quality from the natural tones of the instrument. We have often thought that Ponto, with all his dexterity, produced some of these new notes with similar difficulty, to a person ridden by the night mare, who tries to cry out, but cannot.

The Hi-brue used made use of horns, formed of rams' horns, to proclaim the jubilee; whence the name jubilee; which fec.

The French horns used in concerts are usually tuned an octave lower than the trumpets, to which they are closely allied in their principles. The whole length of tube yielding the fundamental note is often about ten feet, but it is the octave of this that performers in general are able to reach, in which the column of air in the tube vibrates in two equal parts; by blowing a little harder, the performer has it in his power to caufe the column of air in the tube to divide itself into three equal parts, and whose vibrations consequently have the ratio of 1 to the fundamental, or VIII + V; a little harder blowing will occasion three nodes or quiescent points of the hand, and the ratio of the sound will be 1/2 or 2 VIII: harder still produces 1/4, or 2 VIII + III: the next note is 1/2, or 2 VIII + V, a repetition of 1/2 an octave higher; then 1/4, which is a false or unnatural note, less than the minor 7th (1) by 24.9472 Σ + 2 m, the note being 2 VIII + this false 7th above the fundamental tone of the instrument. By blowing still harder each 1/3 part of the tube's length yields its sound, which has the ratio 4, or 3 VIII: the next is 1/2, and gives 3 VIII + II, or the true major tone: then 1/4, or 3 VIII + III; a repetition of 1/2: then comes 1/2, which is 27.2517 Σ + 2 m sharper than a true minor fourth, being 3 VIII + this false 4th; the next note is 1/4, or 3 VIII + V, another repetition of 1/2: then 1/4, which is 12.8872 Σ + 2 m lower than a true major fifth, or 3 VIII + this false V: then 1/4, which is a repetition of the false 7th, or 4, but an octave higher; then 1/4, or 3 VIII + VII or true major seventh, 1/2: then 1/4, or 4 VIII: then 1/2, which is a false minor second,
second, 3,46819 less than the major femitones, \( \frac{1}{2} \), or 4 VIII + this falle 2d; then \( \frac{1}{2} \), or 4 VIII + II, a repetition of \( \frac{1}{2} \) above; then \( \frac{1}{2} \), which is a falle minor third, less by 9,2798 \( \Sigma + m \), then the true minor third, \( \frac{1}{2} \), or 4 VIII + this falle 3d; then \( \frac{1}{2} \), or 4 VIII + III a repetition of \( \frac{1}{2} \) two octaves higher; then \( \frac{1}{2} \), or 4 VIII + V + the falle 7th arising from \( \frac{1}{2} \), or another falle minor fourth (differing 41,1509 \( \Sigma + 3 \) m, from \( \frac{1}{2} \) above), which is 13,0472 \( \Sigma + m \) flatter than the true 4th. Next, by increasing the strength of the blast, will arise \( \frac{1}{2} \), which is a repetition of the falle former fourth \( \frac{1}{2} \), as an octave higher; then \( \frac{1}{2} \), which is a falle minor fifth, 9,46262 + m sharper than the semi-diapente or flat fifth, \( \frac{1}{2} \), or 4 VIII + this falle 7th, which is 19,46026 \( \Sigma + 2 \) m sharper than the true minor fourth or tri-tone, \( \frac{1}{2} \); then \( \frac{1}{2} \), or 4 VIII + V, a repetition of \( \frac{1}{2} \) three octaves higher; then \( \frac{1}{2} \), or 4 VIII + 3 III, the double (or square) of \( \frac{1}{2} \), and is \( 2 \Sigma + 2 \) m flatter than the true minor sixth, or 4 VIII + this falle 6th: then \( \frac{1}{2} \), which is the repetition of the falle major sixth \( \frac{1}{2} \) above; then \( \frac{1}{2} \), or 3 VIII + V the triple of \( \frac{1}{2} \), is another falle major sixth (differing 23,58107 \( \Sigma + 3 \) m from \( \frac{1}{2} \) above), or 4 VIII + a comma-redundant major sixth, instead of the true VI: then \( \frac{1}{2} \), which is a repetition of the falle minor seventh or \( \frac{1}{2} \) above, but two octaves higher: then \( \frac{1}{2} \), which is another falle minor seventh (differing 31,0707 \( \Sigma + 3 \) m from \( \frac{1}{2} \) above) and being 6.12449 \( \Sigma + m \) sharper than the minor seventh, \( \frac{1}{2} \), or 4 VIII + this falle 7th: then \( \frac{1}{2} \), or 4 VIII + VII, a repetition of \( \frac{1}{2} \) an octave higher: and lastly, \( \frac{1}{2} \) is a falle eighth left of the octave by 28,11748 \( \Sigma + 2 \) m, or 4 VIII + this imperfect VIII.

And thus we have all the natural horn or trumpet notes within the compass of five octaves, of which it may be observed, that the IIIId, Vth, and VIIId are the only concords found among these horn notes, which explains the reason of these being the only Acute Harmonics (fee that article) which accompany a note: the IId and 6th composed by doubling these harmonics, the XIId and the XVIIId; the VIth by tripling the XIId; and the VIIth by combining the XIId and XVIIId together, are the only other notes of the horn or trumpet which belong to the diatonic scale, this deficient minor fifth, and the comma-redundant major fifth, being however inapplicable to practice, and all the remaining ten notes, enumerated above, are anomalous, and have the effect of highly tempered notes or wolves in the practice of diatonic music, which is alone used at this day. Composers for the horn continue to introduce as few of these false notes into their pieces as possible, and modern horn players also, by introducing their hand, or a block of wood, into the back end of the horn, contrive, by habit, to correct many of the false intervals when playing in concert; but this is often done at the expense of clearness and fulness of tone.

The late Mr. Charles Clagget, by combining two horns or trumpets of different pitches together, so that the same mouth-piece, by means of a slide, acted on by the finger, could instantaneously be made to sound either tube, which he called his chromatic French-horns and trumpets, pretended, that by this means all the falle notes were corrected: which of course supposes, that they were all alike tempered or defective, and that these lay all the same way, but which is far from being the case, as will appear from the recapitulation of the temperaments in the margin, where, however, the flat fifth is omitted, being sharpened + 9,460 \( \Sigma \), and consequently it would be further injured by a new tube, sharper than the fifth, either

\[

7d & 24,747 \\
6th & 22,581 \\
4th & 13,947 \\
3d & 9,271 \\
2d & 3,468
\end{array}
\]

(15,836 \( \Sigma \) which is the mean among the above flat temperaments), or by any other difference of pitch in the two tubes, which might be adopted. We shall resume the curious theory of this instrument in the article Trumpet. Hors are tuned, or brought to the proper pitch for playing in concert with other instruments, by means of short pieces of tube of different lengths called crooks, which are put on or taken off below the mouth-piece, so as to lengthen or shorten the entire length of the tube, according as the pitch wants lowering or raising.

Horn, in Architecture, is sometimes used for volute. Horn is sometimes also used for the hoof of a horse, &c.

Horns, in Botany. See Medicago.

Horns and Hedge-hogs. See Medicago.

Horns of the Altar. See Altar.

Horns, Ammon't. See Cornu Ammonis.

Horn-bird Tree, in Gardening. See Carpinus.

Horn-bill, in Ornithology, the genus bucerus of Latin authors, calao of the French. This genus is distinguished by having the bill convex, curved, and sharp at the edge, large, serrated outwardly, and furnished with a horny protuberance or excrescence on the upper mandible near the base; the nostrils behind the base of the bill; tongue short, and sharp at the point; toes, three forward and one backward, the middle one connected to the outer as far as the third joint, and to the inner as far as the fifth.

These birds subsist, for the most part, on fruits of various kinds, generally inhabit woods, and with few exceptions are natives of the old continent.

Species.

Native of the Philippine islands; size of a common hen; the plumage above black, beneath white; quill-feathers with a white spot; tail rather long and black; tail-feathers ten in number, of which the exterior four on each side are white and those in the middle black; legs greenish. A fuppofed variety is described in the 23d volume of the Philosophical Transactions under the name of cayao vel calao, the bill of which is red, the belly black; and the back and rump brownish; the legs scaly and reddish, and the claws black.

This species does not frequent watery places, but inhabits the higher lands, and is most common in mountainous situations. It feeds on fruits, among which it prefers the fig, almond, and piliachia; these it swallows whole, and after digesting the pulp calls up the stones entire. Its voice is said to resemble the bellowing of a calf. The Indians worship this species as a deity.

Referrers a raven in shape, but is larger and more robust; it inhabits Abysinie, and subsists chiefly on the large green beetles which infest the plantations of grain. The flesh has a fetid odour. According to Bruce it lodges in thick trees, and is known by the name of "teir el nachtu," or bird of defity, on the frontiers of Sennaa. In the eastern parts it is called abba gundu, and in the west erkoones. The bill is black, edged with white, and about the rafe of the upper mandible each side is a tuft of brilly feathers.

Vol. XVIII.
Horn-Bill.

Described on the authority of Latt, who tells us it is the size of a turkey, with the plumage wholly black; the bill and head measured together were equal to eighteen inches; the figure of the bill not unlike that of the Philippine horn-bill, but having the appendage on the top of the upper mandible almost straight at the point; the color partly red, and partly yellow, and the edges and base of both mandibles black. This description is adopted from father Latt by Buffon, nor does it appear to be better known since that time, as Sonnini, in the latest edition of Buffon, adds nothing to the description that was previously given by that author. There is or was formerly a specimen of this bird in the Leyden museum.

The length two feet six inches, or three feet; both mandibles curved downwards, and sharp at the tip; protuberance four inches and a half long, the greater part black, the middle, both of the protuberance and the bill, dirty yellowish-white; vent, quill, and outer tail-feathers with white; legs strong and black; claws long, hooked, and rather blunt. This species is known to devour rats, mice, and small birds, raw flesh, and vegetables; its motions are not dissimilar to those of the rufous, leaping forwards or sideways with both legs at once; its note is various, being sometimes hoarse, or like the clucking of a turkey, and sometimes weaker.

Sonneret describes a variety of this bird under the name of Calao de la coté de Coromandel, from its being found on the coast of Coromandel; the bill of this kind is curved, the protuberance egg-shaped; quill-feathers and tail, except the two middle feathers, which have their bases black, are white. Dr. Latham is inclined to believe le calao des Philippines of Pl. Enl. is also a variety of this bird.

Albostris. Bill white.

This kind, which is recently described by Sonnini under the title of le calao a bec blanc, is nearly allied to the former species, B. malabaricus.

A native of the Molucca isles; its length two feet four inches; the protuberance cinereous, and behind whitish; crown blackish; cheeks and chin black; hind head and neck pale chestnut; back, shoulders, and rump, with the wings and tail-coverings, brown; breast and belly blackish, the latter yellowish on the hind part; tail ash or dirty white; legs grey brown; claws black. Feeds on the wild nutmeg, which renders its flesh pleasantly aromatic. This bird is frequently tamed to destroy rats and mice.

Length three feet. This species inhabits India, preys on rats, mice, and carrion, and often follows the hunters for the entrails of their game. The bill is ten inches long, the protuberance eight inches. Inhabits India.

Collaris. Protuberance of the bill flat, grooved, and yellow; body and wings black; space of the neck bright red; tail white. Le calao de Waygiou, Sonnini.

A species found in Waygiou, one of the Molucca isles; its length is two feet and a half; and the bill seven inches and a half long.

Vulagelus. Protuberance large, and much elevated above the upper mandible, flat at the sides, and marked with two longitudinal furrows; plumage above black, glossed with green, beneath white. Le calao violet, Levallant.

Found in the isle of Ceylon, and on the coasts of Coromandel.

Coronatus. Protuberance sub-coronated, the bill large and yellow, or reddish; body above blackish, glossed with blue; abdomen and thighs yellowish white; tail rounded, white, and in the middle, black. Le calao a coq en croissant, Sonnini.

Size of the rhinoceros horn-bill. This species is common in the Molucca isles, where it inhabits great woods, is very fagace, and feeds on careafes. The legs are blackish brown.

Galeatus. Bill straightish; protuberance nearly square, the posterior part rounded, the anterior flat. Gmel. Calao a coque round, Buff. Helmhorn-bill.

Nothing more is known of this curious species than the bill and head, the structure of which sufficiently distinguishes it, and announces it to be of a larger size, and polished of greater strength than the generality of other birds in the same tribe. Specimens of the bill are not unfrequent in museums, and these vary in length from six to eight inches; the colour is usually red, and the feathers, sometimes attached at the base, are black.

Size of a raven; the bill very long, arched, brown, with transverse lateral wrinkles, and longitudinal orange furrows; orbits naked and brown; irides whitish. The head and neck of the female is white, with a large triangular greenish-black spot; legs lead colour. Inhabits the isle of Panay.

Native of Manilla; length twenty inches. The bill rather curved and acute at the tip; head and neck white, waved with brown; temples with a black spot; tail with a fulvous band across.

Inhabits Africa, near the river Senegal; its size is about that of the common wood-pecker; it feeds on fruits, and, when young, is easily tamed. When young the bill of this bird is black, the colour changing gradually to red as the bird grows older; the body above is forcid greyish, and white beneath; claws black. The bird called by Buffon le tuck is considered as a variety of this bird; its size is nearly the same, except that its length is half an inch less; the body varied with grey and black, beneath and collar whitish; head and throat lined with black; two middle tail-feathers grey, the rest blackish, with the tip white.

A species described from a specimen caught between the island of Timian and Pultomien. Size of a small goose; the bill
bill narrow, and bent down; neck a foot long, and as small as that of the crane.

L.atedus. Proportionate on the bill divided transversely into several lobes; plumage black glossed with blue; on the shoulders a red brown spot; tail whitish. Le calao a
caque foliain, Levallant.

Inhabits Batavia; length thirty inches, the bill five inches long and two thick, and the margin not denticulated; color yellow-white, with the base brown; eyes surrounded by a naked wrinkled skin which covers the base of the mandible, and descends upon the throat; the feathers on the back of the head are long; great quill-feathers deep black. The female is rather smaller than the male, and has no space of red brown about the shoulders.

Obscurus. Proportionate rounded above, and divided into from or eight lobes; body black; tail-feathers white. Buceros plicatus, Latham. Indiam raven, Will. Wreathed
horn-bill.

Native of New Guinea; the bill bent, and five or six inches in length. A supposed variety of this bird, found in Ceylon, has the proportionate on the bill divided into no more than five lobes.

Ginignianus. Bill bent, compressed laterally; proportionate pointed; body above green, beneath white; two middle tail-feathers dirty, rufous gray, with a band of black at the end; the red rufous near the end, and white at the tip. Buceros ginignianus, Lath. Le calao de, Gungi, Sonerat. Gungi horn-bill.

Length two feet; the bill from the base to the middle with the proportionate black, the white, the edges ferrated; cheeks with an oval black base under the orbits; legs black. Inhabits the coast of Coromandel.

Inhabits New Holland; size nearly as large as the jay; the nostrils open near the base of the bill.

Native of New Holland; the crown black; bill yellow, with a black spot at the base; at the corner of each eye a tuft of bristles, and behind a black blue spot; wing-cares variegated with black; quill-feathers white at the tip.

Viridis. Proportionate abrupt; body black; wings greenish. Lath. Green-winged hornbill.

The bill in this species is yellowish, at the base of the un der mandible is a whitish blue spot; the outer tail-feathers, with the base of the quill-feathers, and the belly, white; legs blueish. Country unknown.

Ceylonensis. Bill denticulated, and without proportionate, black and white; head above, creet, hind part of the neck, back, and coverts of the tail brown, blended with greenish grey. Le calao gingala, Levallant.

Inhabits the isle of Ceylon.

Javanicus. Bill not denticulated and without proportionate, brown with the base yellow; front, head above, and long feathers of the creet red brown; body above and beneath black; neck and tail white. Le calao javan, Levallant.

Length thirty inches; bill four inches and a half long; skin under the eyes, and chin down to the throat, deeply wrinkled; plumage finely glossed with greenish; legs brownish, and the claws yellowish white. This species inhabits Batavia, where it is called jaar vgel.

Levallois, to whose costly work on American and Indian ornithology, we are indebted for an account of the two preceding birds, has placed them in the caloo or horn-bill tribe, and in this respect we follow his example, though not entirely satisfied with such an arrangement. The absence of a proportionate on the bill in both kinds seem clearly to remove them from the caloo tribe, notwithstanding they accord with that genus in some other particulars; in the denticulation of the bill and structure of the claws le calao gingala agrees with the horn-bill, but le calao javan is still less nearly allied, the bill in this kind being neither denticulated nor ferrated at the margin, and it has only the claws of the true horn-bill to justify its reference to that genus. The last mentioned kind, from the form of the bill, appears in some degree connected with the corvus tribe.

Horn-blend, in Mining, is applied to such coal as dips almost equally on the face and the end, or in which the planes or lengthways joints of the coal cross the water level diagonally, such coal being often worked with fahian and re-entering angles, like the horn-works of a fortification, whence probably the name was derived; such are often called half-workings of coal.

Horn-coal, a name given by fowlers to the great horn
owl. (See Strix Bubo.) A sportman who has got one of these birds, has a constant lure to draw together almost what numbers of others he pleases. The method of taking other birds by it is thus: the sportman fixes upon some single tree which stands in the middle of an open field, and cutting the boughs of this into a regularity, he spreads nets all about it, and then places his owl within them, with a firing fastened to its leg, by means of which the bird may be put in motion by the sportman as it stands at the distance under covert. There are to be two perches placed near one another, so that the owl can easily go from the one to the other. It is the nature of this bird to fly only by night, and therefore whenever it is seen by day-light, all the other birds quarrel with it, and abuse it; even the hawks will make at it wherever it comes in their way. The sport
man depends upon this; and as soon as he sees any bird approach, or as soon as the owl, who sees farther than he can, gives him the signal that some bird is in sight, he pulls the string, on which the owl, being disturbed, flies from one perch to the other. This draws the strange bird to her; and flying violently at her, it is entangled in the net placed with that intent, and the sportman must immediately run up and take it out, and replace the net for the next.

Horn-fish, an English name for the fish which we also call the gar-fish. It is properly a species of pike or eox. See Esox Boleae.

Horn-fish, in Ichthyology. See Cornutus piceus and Bia
culeatus.

Horn, hart, cornu cervi. The scarpings or rapsings of the horn of this animal are medicinal, and used in decoctions, pitfans, &c.

Hart horn is too expensive an animal bone to be employed for the common preparations of ammonia, for which purpose the bones, that are the refuse of the streets, are used; and if, after distillation, they be further burnt in an open fire, the residue in each instance will be the same, and chiefly phosphate of lime. Hart horn, however, affords that particular modification of bone to which the preference is given for the purposes of pharmacy, and the consumption is not so great, as to render the direction either too expensive or difficult to be complied with. The phosphate of lime left in a

amounts D d 2
HOR

amounts to 57.5 of the bones employed; they appear also to contain a small quantity of carbonate of lime and phosphate of magnesia, and the remainder is animal matter, which passes away in various compound gasses under the circumstances in which it is in this preparation directed to be placed.

Hart-horn jelly is nutritious and strengthening, and is sometimes given in diarrhoea; but a decoction of burnt hart-horn in water is more frequently used for this purpose, and is called hart-horn drink. See JELLY.

The coal of hart-horn, by being calcined with a long continued and strong fire, is changed into a very white earth, called hart-horn calcined to whiteness, or cornu albus. This earth is employed in medicine as an absorbent, and administered in drenchers and febrifilms, which are suppofed to be caufed by acid and ill-digested matters. This earth levigated is the basis of Sydenham's white decoction, which is commonly prefcribed in these diseases.

The white decoction or mixture of burnt hart-horn is prepared by boiling down two ounces of hart-horn burnt and prepared, and one ounce of Acacia gum, in three pints of water to two, contantly furring, and afterwards draining it. As burnt hart-horn confists entirely of phosphate of lime, which is inofible in the preparation above directed; it is only brought into the flate of a very fine powder, and is kept mechanically fufpended in a maculuted liquor, on which account the gum is an useful addition, to the original formula in Bates's Pharmacopoeia, which contains none. This is retained in the late pharmacopoeia as one of thefe established forms which are in use with many practitioners. The pulvis opiatius, or powder of burnt hart-horn with opium, is a compound of hard opium powdered, a drachm, hart-horn burnt and prepared, an ounce, and cochineal powdered, a drachm, well mixed. This preparation affords a convenient mode of exhibiting small quantities of opium, ten grains containing one of the opium. As the article by which it was divided is of no other confluence, a small quantity of cochineal is added to give it a colour, and thus prevent it from being accidentally confound with any of the numerous white powders kept in the shops. The former name of pulvis opiatius was particularly exceptionable, as sometimes in the abbreviation of prescriptions it was confidered to be mistaken for purgative. The falt of hart-horn is a great fudorifick, and given in fevers with success; and hart-horn also yields, by distillation, a very penetrative volatile spirit.

Horns-kipped. A horfe is faid to be fo, when the tops of the two haunch-bones appear too high.

Horn-owl. See Strix bubo.

Horns of Plenty. See Cerinoecia.

Horns with horn, or Horn under horn (cornutum cum cornu), is when there is common per cæfe de vîcinoage, intercommoning of horned beafts. See Common and Intercommoning.

Horns of Insects. See Feelers and Entomology.

Horns Shavings, a term applied to the small thin pieces of woodly horns matters which are formed in the preparation of different articles from this fubfance, in extensive manufactorys. Every fort of refuce material of this defcription has been found benefical upon land, when employed in the way of a manure, either as a top-drefling, or when turned into the foil. In the county of Hereford they make ufe of two decriptions of these forts of matters, the small fort, or turner's shavings, and the large, or refuce pieces of horn, which are cut off by the faw or any other tool. The farmers purchase the firft of these forts in London, at from about thirteen or fourteen fhillings the quarter, or ten-fulfel fack fluffed quite full, moftly weighing about two hundred and a half. They are generally employed exactly in the fame way and proportions per acre as the clippings of farriers, only they do not ftand in need of being pricked into the foil when ufed upon the surface of the tillage lands. And it is the ufual practice with the large fort to have them ploughed into the foil, about three months before the time of fowing either wheat or barley. Shavings of these kinds are found, from actual trials, to anfwer well in moft foils and feaons, with the exception of fuch as are very dry and parching, when they are laid not to work, by the farmers. The small shavings should be preferved, as being the most ufeful and advantageous when employed in the way of a drefling for land. See MANURE.

Horns, Staining of. See Bones, Dyeing, Ivory, Tortoisell, and Wood.

Horns, Fufli, in Natural History. The horns of animals, accompanied by their skulls and bones, or otherwife, are fometimes in the earth, but always in loofe and alluvial earth, or in caverns and fiftures, near the surface, as was remarked by Dr. Woodward, and has been confirmed by fubfquent obfervers. The folfil horns which have been defcribed are faid to be thofe of

A Calf, defcribed to be conic, crooked, with a pit and ray, not unlike a young budded horn. Dr. Grew's Raries, p. 274.

Deer.—Horns remlbling thoie of deer are faid to be frequently met with in the peat-pits in Ireland. Phil. Tranf. Abir. by Lowth, vol. ii. p. 454.

Some of these are very large, and have very broad palms above the brow antlers, which are palmed alto. (Gent. Mag. vol. lxxv. p. 113.) Parts of a large deer's horn were found in a pit at Hutton Hill, in Somerfetshire. (Jones's Phyf. Difq. p. 425.) In digging the West India Docks, in the Ifle of Dogs, and in the bead-pits near Newbury, in Berkifhire, deer's horns are met with. Parkifon's Org. Remains, p. 95 and 98.

Horns of the fallow-deer are faid to have been found by M. Cuvier, in loofe frata, in France. Phil. Mag. vol. xxxv. p. 387.

The horns of the moofe-deer, very large, were dug up in 1781, at Beline, N. E. of Carrick, in Kilkenny, in Ireland, which are preferved in Belborough hall, near that place. (Tighe's Survey of Kilkenny, p. 98.) Others are mentioned by Mr. Jamerfon, Shetland Ifles, p. 158. Horns of this kind of deer are also mentioned to be found in America. Jones's Phyf. Difq. p. 420.

The horns of a rein-deer were preferved at Cheffer, which were dug up there. Benj. Martin's Nat. Hist. vol. ii. p. 245.

Elks.—Among the remains of ruminating animals in loofe frata, M. Cuvier found the horns of a species of elk, now extinct. In Hardwick hall, near Alt Hacknal, in Derbyshire, horns of a prodigious size are preferved, which, it is faid, were found many years ago in peat, in the northern parts of Derbyshire, and to be thofo of an elk.

Goats.—The horns of goats are among thofe enumerated by M. Cuvier, as found in the recent alluvial foils near Paris. Phil. Mag. vol. xxxv. p. 387.

Oxen.—The horns of different Species of these, are flated by M. Cuvier to be found in the loofe recent foils of some valleys in France.

Stag.—The head and horns of a stag were dug up at Watering ton park, in Oxfordshire, mentions Dr. Plott, Staffordshire, p. 161. In the peat of Plumead level, by the Thames. (Phil. Tranz. vol. i. p. 109.) They have also occurred
occurred to M. Cuvier in the alluvia and putrid marshes of France. Phil. Mag. vol. xxxv. p. 387.

In the accumulations of tufa from the petrifying springs at Matlock Bath, and formerly at Alport, near Yolgrave, in Derbyshire, very large flag's horns have been found at different periods.

**Urart.**—The horns of this large animal have been found in the pent-pits of Ireland (Jamefon's Shetland Isles, p. 158.; and according to M. Cuvier they have been found in the valley of the Somme, allo in Suabia, Prussia, Italy, and England. Phil. Mag. vol. xxxv. p. 387.

The horns of very large unknown animals were found at St. Martins, near Commerce (Nicholson's Journ. 8vo. xxvii. p. 159.; and others with the teeth and skull at Oolte, near Niuav, in Ruffia, (Phil. Mag. vol. xxxv. p. 318.) At Hopton hall, in Derbyshire, the pith of a horn 5½ inches diameter above the bone of the skull, and 16 inches long, is preserved, which was found near Padley hall, 15 feet beneath the surface, in the deep-cutting at the W. end of the Butterly tunnel for the Cromford canal.

We have selected the above, in order to shew, that the horns found in a fossil state in the earth are of various kinds; and from the details which are preserved respecting them, there seems no reason to think that horned animals existed, while the flora was depositing, the most ancient of these horns being found in the alluvial flats or marshes in the valleys, and no considerable portion of them in peat, which proves their recent origin.

Sometimes extraneous fossils have been called horns, which have no pretensions to that character, an instance of which occurs in Derbyshire, where the quarrymen and colliers find a conical and slightly bent fossil, which they say is the bony core of a horn, or horn as they pronounce it; these are found, with various formations in the shape, in grit stone at Overton quarry, at Wickerley quarry in Yorkshire, in Winglesworth, Chesterfield, Alfreton, &c. In bind at Bretby, &c. Mr. William Martin, in his Petricata Dercibienia, plate 8, shews them to be of vegetable origin, and denominates them Gramnias fulvata. Some have supposed these horn-like fossils to be a kind of cupped coralloid.

The idea is, that two proceeds arling from the sides of the fund. See **URBES.**

**Horn-work, in Fortification, a sort of out-work, advancing toward the field, to cover and defend a curtin, bailion, or other place, suspected to be weaker than the rest; as also to possess a height, &c.**

It consists of a front and two branches; the front is made into two demi-baillons and a curtin; its sides, or flanks, are usually parallel; though sometimes they approach or contract towards the place, forming what they call a *queue d'yeuand,f* or swallow's tail.

When the flanks are too long, they sometimes make cauplaments to flank them. The parts of the horn-work next the country are to be defended by a parapet.

For the construction of horn-works, produce the capital of the ravelin beyond the falant angle A (Plate VI. Fortification, fig. 1.) to the distance A B, of about eighty toises; draw D B E at right angles to A B, in which take B D E, each equal to fifty-five toises; and on the outward side D E, trace the front of a polygon in the same manner as that of the body of the place, making the perpendicular B F eighteen toises, and the faces thirty. The branches D a, E b, of the horn-work, when produced, terminate on the faces of the baillons, within five toises of the shoulders. The ditch of the horn-work is twelve toises, and its counter-scarp parallel to the branches, and in the front terminates at the shoulders. The capital of the ravelin before the front of the horn-work is thirty-five toises, and the faces terminate on the shoulders, or rather two or three toises beyond them; and the ditch before the ravelin is eight toises. There are sometimes made retracements within the horn-work, such as S S; which are constructed by erecting perpendiculars to the faces of the ravelins, within twenty-five toises of their extremities. This retracement, like all others, has a parapet turfed only with a beam of eight feet before it, and likewise a ditch from three to five toises broad.

When a horn-work is made before the bailion, the distance of the front from the falant angle of the bailion is a hundred toises; and the branches terminate on the faces of the adjacent ravelins within five toises from their extremities; the rest of the construction is as before.

Two horn-works joined together make a crown-work, which is constructed by describing from the falant angle A (fig. 2.) of the ravelin, as a centre, an arc of a circle, with a radius of about 120 toises, cutting the capitol of the ravelin produced at C; from the point C set off the chords C B, C F, each equal to a hundred and ten toises, and on each of these construct the front of a polygon of the same dimensions, as in the horn-work, that is, the perpendicular should be eighteen toises, the faces thirty, and the branches terminate on the faces of the baillons, within twenty-five toises of the shoulders. The ditch is twelve toises; the capital of the ravelin thirty-five, and its ditch eight. When the crown-work is made before the bailion, the arc is describ'd from the falant angle of the bailion with a radius of a hundred and twenty toises, and the branches terminate on the faces of the adjacent ravelins, within twenty-five toises of their extremities, &c. as before. Muller's Elem. of Fortif. p. 39. &c. See Military Construction.

**Horn-sward, in Zoology, the trivial English name of the genus Fluitra, a tribe of Vermes in the Zoophyta order. See **FLUSTRA.**

**Hornagium, Hornage, in our ancient Laws, seems to import the name with horngold.**

**Hornbeam, in Botany, &c. See Carpinus.**

Hornbeam, in Rural Economy, a name commonly given to a tree of the deciduous fort, which is occasionally grown as timber, being made use of in turnery, as well as for the cogs of mills and other similar purposes.

There are two species of this tree, the common *hornbeam,* and the *hop hornbeam,* but which afford the following varieties; as the *corylum hornbeam,* the *flowering hornbeam,* the *Virginia flowering hop hornbeam,* and the *American hornbeam.*

The common hornbeam is a native of Europe and America, while the hop hornbeam is met with in Italy and Virginia. The common hornbeam grows to the largest size, and is probably the best kind for the purposes of timber.

**All the sorts of these trees are capable of being increased, either by seeds or from layers. The layer method succeeds at almost any season of the year. The seeds may be sown in the feed part of the nursery any time in the autumn, after they have been a little dried upon a mat, or otherwise, for the purpose. This is beil done in narrow beds to the depth of about two inches, which should be kept perfectly clean and free from weeds. They must continue in these beds until the second spring, when they come up, and require to be kept free from every sort of annoyance, being watered in very hot seasons. About the third spring the young plants may be set out in the nursery grounds, where they may continue**
continue until they are wanted for being planted as standard trees.

In the layer method, a few good plants should be provided for the purpose of shoots; which in the Eastern form may be planted at a yard distant, but with the others a yard and a half, or even two yards apart. As soon as these plants have made a proper number of shoots, they should be laid or laid down into the ground in the autumnal months, and in the course of about a twelvemonth they will generally become well rooted; at which time, or in the winter or early spring, they may be taken off, and planted out in the nursery manner, taking care to bruise up or mould the soil well, for the future produce of young shoots for additional supplies of layers. The plants in the nursery should be allowed about a foot or a foot and a half, the rows being at the distance of two feet. They may continue in this situation until they are wanted for being finally planted out, being carefully weeded, and the mould well stirred about them in the rows, by winter digging, &c. The Virginia hornbeam frequently throws out two leading shoots, which afterwards contend for the maltry. Where this is the case, that which appears the beest should be preferred, the other being removed by means of the knife. If this be neglected the trees will be liable to become forked in most cases, and of course less valuable to the planter.

The common hornbeam affords excellent stakes and eddards, besides fuel wood and charcoal. The timber produced by it may be ranked with those of the beech and fycamore; but its principal superiority consists in its excellence for the purposes of fence fences for sheltering gardens, nursery grounds, and different forms of young plantations, from the severity of bad foyons, &c. It bears cutting in, pruning, and clipping, extremely well, and, from its retaining its leaves during the winter season, becomes particularly close and impenetrable to the winds and storms, keeping up a very steady temperature of the atmosphere about the plants which it shelters. On this account also, it is found beneficial to be planted in mixture, or in occasional rows, with many tender foyons of trees in high exposed aspects, in the manner of the birch, to which it is preferable, as affording greater warmth in the winter. This foyon should perhaps be more attended to as a nursery for young exposed plantations of trees, than has hitherto been the case, in consequence of its qualities in this way being but imperfectly known.

The eastern part is particularly valuable where low hedges of deciduous trees are wanted, from its inferior growth, and the thinness of its leaves and cloleness of the branches.

Hornbeam Pollengers, a denomination given by some to trees of this species, which have been lopped, and are of about ninety years growth. See Tree.

Hornbeam Wood, Petrified, in Natural History. In a breach of the embankments or tide walls of the Thames, which happened near Purfleet, as described in the Philosophical Transactions, No. 325, the Rev. W. Derham distinguished hornbeam among the other woods and vegetable products found a great way below the surface of the marshes; belonging, however, to the clafs of recent or peat foills, and not to those of the strata.

Hornberg, in Geography, a town of Wurtemberg, in the Schwartzwalde; 38 miles S.W. of Stuttgart.—Also, a town of Germany, belonging to the Teutonic knights, near the Neckar; 18 miles E. of Heidelburg.

Hornburg, a town of Welfphalia, in the principality of Halberlattlant, on the Ilfe; 10 miles N.E. of Goslar.
his attainments in polite literature, as for that species of knowledge which is subservient to the illustration of the scriptures. In the year 1749 he took his degree of B.A.; and in the following year, upon a vacancy taking place in a Kentish fellowship at Magdalen college, he was elected to fill it. Meantime the time had been that he had been introduced with the mysteries of Hutchisonianism, which led him to do its utmost to bring discredit on the system of Isaac Newton. He published on this occasion, without his name, a work that was sincerely abhorred of afterwards, and never suffered it to be reprinted. In 1752 he took his degree of M.A., and in the same year engaged in a controversy on the subject of the Cherubim, in the Gentleman's Magazine. His object was to prove that the Cherubim were a representation of the Trinity. In 1753 he entered into orders, and soon obtained a high reputation as a preacher, on account of the excellence of his compositions and the gratefulness of his eloquence. In 1764 Mr. Horne was admitted to the degree of doctor in divinity, and in 1768 he was elected president of Magdalen college; and in 1771 he was appointed chaplain in ordinary to his majesty, in which capacity he officiated for ten years. In the following year, when a number of the clergy were about to apply to parliament for relief in the matter of subscription to the liturgy and the thirty-nine articles of the church of England, Dr. Horne did all in his power to defeat their object. He was next appointed vice-chancellor of the university, in which station he continued till the month of October 1780, and no one ever presided in that post with a more conscientious attention to its duties, or a greater share of popularity. The vice-chancellorship introduced him to the acquaintance of lord North, by whose interest he was promoted to the deanery of Canterbury, in which situation he acquired the respect and esteem of all, and frequently gratified the public by preaching in the cathedral. In 1790 Dr. Horne was advanced to the episcopal see, by being nominated to the bishopric of Norwich, soon after which he resigned his presidency of Magdalen college. At this period, his health, which had ever been delicate, was in a precarious state, and after he had taken pox, he retired to his seat; his friends saw, with extreme sorrow and regret, that he declined very rapidly. From two visits to Bath he received sensible benefit, and in the autumn of 1791 he set out on a third visit to the same place. During his journey he was attacked with a paralytic stroke, from the effects of which he never recovered, though he was enabled to reach to the end of his journey. After lingering for some weeks, during which he retained the full possession of his faculties, and displayed exemplary patience, composure, and cheerfulness, he died at Bath on the 25th of January 1792, in the sixty-second year of his age, animated by those hopes which spring from the confidences of a well spent life, and the promises of the gospel. The works of this excellent divine were numerous, and many of them valuable. His principal piece was a "Commentary on the Book of Psalms, &c." which made its appearance in 1776, in two volumes. It was his favourite performance, and had cost him the best part of twenty years in the composition. Dr. Horne was distinguished by a considerable share of various learning, which he consecrated, according to his judgment, to the cause of truth, and the best interests of mankind. His virtue was sincere and ardent, and his life exemplarily virtuous.

HORNECK, Anthony, a learned divine, was born in the lower Palatinate in 1641, and educated at Heidelberg under Spanheim. At the age of 19 he came to England, and entered himself of Queen's college, Oxford, of which he was afterwards the chaplain. He was now incorporated M.A. from the university of Wittemberg; and not long afterwards obtained the vicarage of Althallows in Oxford. He retained this living only about two years, and in 1665 removed into the family of the duke of Albermarle, in the capacity of tutor to his son lord Torrington. The duke presented him with the rectory of Doulton in Devon, to which was afterwards added a prebend in the cathedral of Exeter. In 1671 he became preacher at the Savoy, and in 1693 prebendary of Wollminter. He was also honoured with the appointment of chaplain to king William and queen Mary. He died in 1696 of a severe attack of the stone in the fifty-sixth year of his age. He was a man of very extensive learning, and particularly conversant in the Oriental languages, ecclesiastical history, controversial theology, and casuistry. Few men, it is said, were so frequently consulted in cases of conscience as Dr. Horneck. He was author of several pious and learned works, which are as judicious as they are learned, and which are still known and admired. Gen. Biog.

HORNED, a term employed, in some dialects, to signify the goring or wounding with the horns of cattle.

Horned Cattle, a term often made use of by farmers to signify neat-cattle, or animals of the low kind.

Horned Poppy. See Poppy.

Hornet, Crabro, in Entomology, a species of Vespa; which see.

Hornet-fly, a very large two-winged fly, which has the shape and colours of the hornet, and, at first sight, scare to be distinguished from it. The principal colour of the body of this fly is yellow; but it has two long and large black lines placed transversely on it, and has a black corcelet, and a yellow head. These lay, at a proper season, a large number of oblong white eggs, which hatch into large and long worms, whose chief food is the worms and nymphs of the humble bees. The worm of this fly is continually found in the nests of these bees, where it never meddles either with the wax or honey, but preys only on the young offspring of the creature.

Hornet-gild signifies a tax, within the forei, to be paid for the feeding of horned beasts. See Geld.

"Quietes et omni collectione in forcella de belinis cornutis, &c. Est fint quieti de omnibus geldis, et danegeldis, et nodgedels, et senegeldis, et hornegeldis, &c."

To be free of hornedail, is a privilege granted by the king to such as he thinks good.

Hornhead, in Geography, a promontory on the north-western coast of Ireland, at the extremity of a small peninsula, called by the name, in the county of Donegal, province of Ulster. It is supposed to have been mentioned by Ptolemy under the name of Boreum promontorium, and it is still sometimes called North Cape. Hornhead is the western point of Sheephaven, a harbour little frequented, and was probably called from two sharp summits like horns at the top of the cliff, which are a good object for the mariner. The peninsula of Hornhead has been pointed out by Dr. Hamilton (Transact. of the Irish Academy) as exhibiting the effects of drifting sands in a striking manner. In 1787 it contained vast jetties of enclaves so small and so numerous, as to mark the former residence of a number of families in a spot which then exhibited nothing but

"——— A defect, salt and bare

The haunt of feals, and oars, and fearmews' clang.''

Near Hornhead is a curious and frightful phenomenon called McSwine's gun. By decomposition of part of the rock,
rock, the waves have perforated a cave many yards in diameter, which extends about sixty feet into a rock, making part of the mainland, and nearly horizontal with the level of the sea at high and low water-marks. When the wind blows due north and the tide is half in, this gun of McSwine's is seen to spout sea-water far higher than the eye can reach, with an explosion that may be heard at a distance of above twenty miles. Hornhead is near Dunfan-gathy. N. lat. 55° 15'. W. long. 5° 51'.

HORNING, in Scott Law, a writ flowing from the signet, in his majesty's name, at the instance of a creditor against his debtor, commanding him to pay or perform within a certain time, under pain of being declared a rebel, and by a caption put in prison.

HORNIUS, George, in Biography, was born in the Palatinate about the close of the 17th century. He was in his youth a writer of history; and his chief works are "Historia Ecclesiastica ad ann. 1666:" "De originibus Americis:" "Geographia vetus et nova:" "Historia Philosophica." He visited England, and attached himself to the Presbyterian party; and on his return he occupied the chair of history in the universities of Harderwyck and Leyden. He died in 1753.

HORNOS, in Geography, a town of Sweden, in West Bothния; 15 miles S. W. of Umea.

HORNOY, a town of France, in the department of the Somme, and chief place of a canton, in the district of Amiens; 15 miles W. S. W. of Amiens. The place contains 1192, and the canton 10,661 inhabitants, on a territory of 1523 kilometres, in 24 communes.

HORPIPE, in Music, the name of an instrument, and of a tune. The horpipe air, so frequently danced by our fiddlers and active flage dancers, is perhaps the only national tune, or melody, which we can call our own. It is of high antiquity, and can be traced to the ancient Britons, perhaps before the invasion of Julius Caesar, or the Saxons. The instrument, in our old authors, is called the Pip-corn, or pipe of Cornwall. And when the Britons were driven by the Saxons, some went into Wales, some into Armorica, or Brittany, and some into Cornwall, where we may suppose the instrument and tune to have been preferred in the last mentioned province, and to have retained its name. The instrument called a hornpipe, though unknown in England, was a few years ago so common in Wales, according to the late honourable Danes Barrington, that even the shepherd's boys used to play on it. It consists, says Mr. B., of a wooden pipe with holes, at proportional distances, and a horn at each end, the one to receive the wind from the mouth of the player, and the other to produce the sounds, as modulated by the performer. Mr. Barrington communicated to the Antiquarian Society a delineation and description of this rustic instrument (Archaeologia, vol. iii. p. 53.), and conjectured that it originally gave the name to the tune called a hornpipe.

Chaucer, in his Roman de the Rofe, fol. 135, mentions this instrument.

Contra he wouch, and foule saile
With Hornipes of Cornwaille.

Mr. Jones, in one of his tracts, says that the pigborn, or hornipe, is peculiar to the isle of Anglesea; but the word, in old English and French authors, implies a tune as well as an instrument.

The Lancashire hornipes, Cheshire rounds, and some of our very old country dances, are, perhaps, genuine English melodies; but melody, till after the invention of the opera at Florence in 1602, was little cultivated in any part of Europe. We had very good church music in our cathedrals, from the time of Tal lis and Bird, to the arrival of Handel, in 1710; but being put to English words, it never reached the continent.

HORNSEY, or HORNSEA, in Geography, a market town and parish in the division of Holderness, and East Riding of the county of York, England, is seated near a mire, or lake, on the coast. Of this town our topographers have not recorded any historical particulars. Gough, in his addition to Camden's Britannia, merely states that Hornsey "has a high spire, formerly a sea mark, but now much ruined through the inability of the inhabitants to repair it. An inscription in the town says that it was once ten miles from the sea; though at present only one. Not many years ago a small street, called Hornsey-beck, adjoined to the sea, was washed away, except two or three houses; and about Skipsea, a few miles north of Hornsey, they have a tradition of a town called Hide being devoured by the sea. Amber is found in large masses on this coast." There are a small weekly market on Mondays, and two annual fairs. In 1820 the town contained 133 houses, and 533 inhabitants.

Hornsey, a parish in the hundred of Offulton, and county of Middlesex, England. The village is five miles north of Holborn-barns, London, and pleasantly seated in a valley, through which the New river is conducted in its artificial channel. The parish consists of about 2200 acres of land, of which 50 only are arable, about 120 wood, 150 water, or common, and the remainder meadow and pasture. Besides the village of Hornsey, the following hamlets are within the parish: Crouch-end, Muswell-hill, Stroud-green, and a considerable part of Highgate.

The Manor of Hornsey has belonged, from time immemorial, to the bishops of London, who had formerly a palace here. This is supposed to have stood on a spot called Lodge-hill, where are still to be seen the remains of a moat. In this parish, between Highgate and Hornsey, the New river was formerly carried over a valley by a wooden aqueduct, 178 yards in length. A more lasting channel, of clay, &c. was made for it in 1776. Many of the houses here are the residences of London merchants. From the boldness of the hills around, and finely wooded character of the country, Hornsey may be justly considered a very delightful and eligible place of residence. In the year 1801, the parish was estimated to contain 458 houses, and 2716 inhabitants. Lyford's Environ of London, 4to. vol. iii.

HORNSTANDET, a peninsula on the coast of Sweden, in the gulf of Bothnia, about 30 miles in circumference. N. lat. 61° 30'. E. long. 17° 16'.

Gen. Ch. Infiorescens a conical spike, gaping at the top, nearly radical. Calyx two-cleft. Tube of the corolla long, thread-shaped; limb double; the exterior costa three-cleft; cleftly tubular. Capule of three cells, oblong. Retzius. Obf. The two species of this genus described by Retzius, and which we are about to mention, are supposed by Dr. Smith to belong to different genera. He imagines that H. Scyphus is an Amomum, and H. Leonurus, a Kempferia, but as this is merely a supposition, we retain the genus till we learn further particulars concerning it from Dr. Roxburgh.

1. H.

—Found in the thickets of groves in Malacca.—Root simple, having a hot aromatic taint. Stems simple, solitary, nodding towards the top. Leaves alternate, fringed, with golden-coloured bristles, smooth on both sides, smelling like clove. Calyx shorter than the tube of the flower. Grow inferior, nearly globose, small, covered with dark ferruginous hairs. Seeds numerous.

Neither of these species appear to have been known to Rumphius, Rheede, Plukenet, nor any other author who has applied himself to the description of Oriental plants.

**HORNSTEIN**, in *Natural History*, is a name given in Germany to the silex, called in England chert, or chert.

**Horny Excrescences**, in *Surgery*. It appears, from some instances on record, that excrescences of a horny nature have been met with on the human subject, which, although they have not produced the attention of naturalists, must be considered entirely as *Lufts* Nature.

A remarkable case of this description is that of a female who had two complete horns growing on her head, one of which, with the portrait of the woman, is preserved in the British Museum, and the other at Oxford.

A far more recent instance, however, has been obligingly communicated to us by Dr. William Roots of King's College on the Thames, whose, in February 1811, amputated an excrescence of this sort, exactly resembling a ram's horn, from the head of a man, between fifty and sixty years of age, a drawing of which in its growing state, as well as the horn itself, has been presented to the collection of Mr. Alley Cooper.

The case given by Dr. Roots of this extraordinary case is that of John Kennedy, a gardener at Thames Ditton in Surrey, in the year 1796, had a tumour growing on the superior part of the occiput, which was taken off with the knife by the doctor's father in about three years from its commencement. Soon after its removal, a horn-like excrescence began to make its appearance on the same place, which continued growing for four years, till it accidentally fell off in a most unexpected manner, being at that time not more than three inches in length; and it should be observed, that the surface of the part it grew from, on its dropping off, was perfectly smooth, without any of the slightest hemorrhage, and resembling the superficies of the stag's head, when his horns have recently dropped. In a short time after a new horn sprout shot forth, which, as it grew, took on the exact form and crooked figure of a ram's horn, and having increased during four years, without any disposition to fall off, to the great inconvenience of the poor man, he composed at length to its removal; in the performance of which, from the parts underneath being very vascular, a considerable hemorrhage ensued.

Now it appears probable from this, says the doctor, that the horn, had it been suffered to remain longer on the head, would have attained a much larger size, nature having in a playful mood most abundantly supplied it with vessels for that purpose. Its having likewise been fled, in the former instance, without bleeding, induces Dr. Roots to conclude, that as the sources of its nutrient continued open, it had not arrived at that state of perfection, when the gradual thickening of the vessels would occasion a spontaneous removal, without any hemorrhage taking place, as is always observed to be the case with animals who drop their horns at regular and stated periods. Some years since we saw Sir James Earl remove a complete horn, about three inches long, from the ferret of a patient in St. Bartholomew's hospital. We have always believed, that all horn-like excrescences, which are occasionally formed on the skin of the human subject, are originally excreted tumours, the cyst of which very curiously affords the power of secreting horn, instead of fat, a papery substance, or a fluid like honey, as commonly happens in the respective cases of leptom, atheroma, and melecrin. We think that the particulars of the case, communicated to us by Dr. Roots, tend to corroborate this opinion; since, before any horn made its appearance, there was a tumour, and, after the first horn dropped off, a surface, which was quite smooth, which did not bleed at all, and which, in fact, must have been a part of the cyst, presented itself to notice. In the case of the horn, which was cut off in St. Bartholomew's hospital, the truth of the preceding sentiment, concerning the formation of horny excrescences on the human race, was almost demonstrated. There was at first a tumour, which burst, and from the inside of which the horny matter was gradually protruded.

**Hornygold's Key**, in *Geography*, islets and rocks on the Spanish main, near the Mosquito shore. N. lat. 15° 40'. W. long. 82° 18'.

**Horochaw**, a town of Poland, in Volhynia; 32 miles S.W. of Lucko.

**Horodek**, a town of Ruffian Lithuania, in the palatinate of Wilna; 68 miles S.E. of Wilna.—**Alfo**, a town in the palatinate of Brzeze; 58 miles S.E. of Bresfa.

**Horodictic Quadrant**, see **Quadrant**.

**Horodiscze**, in *Geography*, a town of Austrian Poland, in Galicia; 60 miles E. of Lemberg.—**Alfo**, a town of Lithuania, in the palatinate of Minsk; eight miles S.E. of Minsk.

**Horodla**, a town of Austrian Poland, in the palatinate of Belcz, on the Bug; 32 miles N. of Belcz.

**Horography**, composed of *ωας*, *hora*, and *γιος*, *hour*, *time*, *hours*, and *γιοσ*, *speech*, *discourse*, a common name, among ancient writers, for any instrument or machine for measuring the hours. See **Chronometer**.

Such are our clocks, watches, sun-dials, &c. See **Clock**, **Watch**, **Dial**, and **Clepsydra**.

Modern inventions, and gradual improvements, have given birth to some new terms that come properly under this head, and annexed new meanings to others totally different to what they had originally. All chronometers that have reached the hour by striking on a bell were called clocks; thus, we read of pocket-clocks, though nothing could seem more absurd than to suppose that a clock, according to the modern idea, should be carried in the pocket. In like manner, all clocks that did not strike the hour were called watches, or timepieces; and the different parts of a striking clock were distinguished by the watch-part, and the clock-part; the former, meaning that part which measures the time, and the latter, the part which proclaims the hours. In the report of **Isaac** and **Ezra**.
Isaac Newton to the house of commons, anno 1713, relative to the longitude act, he states the difficulties of ascertaining the longitude by means of a watch; yet it is obvious, from several circumstances, that his remarks were directly to be understood of a time-piece regulated by a pendulum; for his objections are founded on the known properties of the pendulum, some of which differ essentially from the properties of the balance and spring. It is also to be remembered, that all the attempts of Huygens for finding the longitude were by means of pendulum clocks, that did not strike the hour, and consequently, according to the language of the times, were called 'clocks'; at this time such machines for measuring time as are fixed in their place, are called clocks if they strike the hour; if they do not strike the hour, they are called time-pieces; and when constructed with more care, for a more accurate measure of time, they are called regulators. Some authors of late have affected to call such watches as were constructed for astronomical and nautical observations, by the name of time-pieces, probably to intimate that they polled the advantages of those constructed with a pendulum.

Mr. John Harrison first gave the name of time-keeper to his watch, for the performance of which he received from parliament the sum of twenty thousand pounds. See Chronometer.

Horology, Horologium, is also a name the Greeks give to their liturgy, or breviary; because it contains the daily hours, or the several offices to be rehearsed each day.

The Greeks call it ωρολογιον, which answers to what in Latin and English we call diurnum, or diurnal.

The ωρολογιον is the breviary of the Greeks.

Horometry, the art of measuring or dividing the hours, and keeping an account of time.

Horopter, in Optics, is a right line drawn through the point where the two optic axes meet, parallel to that which joins the centres of the two eyes, or the two pupils.

Such is the line A B (Plate VI. Optics, fig. 5.) drawn through the point of concourse C, of the optic axes of the eyes D and E, parallel to H I, which joins the centres of the eyes H and I.

It is called horopter; as being found, by experience, to be the limit of distinct vision.

The horopter has several properties in optics, which are described at large in Aguglianus, Opt. lib. ii. Diff. 10.

Horopter, Plane of the. See Plane of the Horopter.

Horoscope, in Astrology, the degree or point of the heavens rising above the eaeulm point of the horizon, at any given time when a prediction is to be made of a future event; as, the fortune of a person then born, the successes of a design then laid, the weather, &c.

The word is composed of ωρος, born, hour, and the verb συντηρεω, speake, consider, I consider. The Latins call it cardo orientalis; sometimes ascendens. See Ascendant.

They were formerly so infatuated with horoscopes, that Alcubius Magnus, Cardan, and others, are said to have had the temerity to draw that of Jesus Chrift.

Horoscope is also used for a scheme, or figure, of the twelve houses; i.e. the twelve signs of the zodiac, wherein is marked the disposition of the heavens for any given time.

Thus we say, to draw a horoscope, construct a horoscope, &c. We call it, more peculiarly, calculating a nativity, when the life and fortune of a person are the subject of the prediction; for they draw horoscopes of cities, great enterprises, &c. See House.

Horoscope, Lunar, is the point which the moon uttus out of, when the fun is in the ascendent point of the east.

This is also called the part of fortune.

Horoscope is also a mathematical instrument, in manner of a planisphere; but now subdued. It was invented by J. Paduanus, who composed a special treatise thereon.

HORPS, Lr., in Geography, a town of France, in the department of Mayenne, and chief place of a canton, in the district of Mayenne; eight miles N.W. of Nantes. The place contains 1618, and the canton 8593 inhabitants, on a territory of 1824 square miles, in 10 communes.

HORREA, in Roman Antiquities, were public magazines of corn and salt meat, out of which the soldiers were furnished on their march in the military roads of the empire.

Horrea was also the name which they gave to their granaries; which fee.

HORREBOW, Peter, in Biography, a celebrated Danish astronomer, and professor of that science at Copenhagen, was born at Langelid, in Jutland. He studied at Aalborg under very unfavourable circumstances, being obliged, at the same period, to submit to various kinds of labour. In 1741, he was appointed professor of mathematics at Copenhagen, and in 1752 he was elected a member of the Danish Academy of Sciences. He died in 1764, at the great age of 85. He was the author of many works connected with his favourite pursuits, among which were: "Copernicus' Triumphant, five Decades of Hebrew Astronomy," "The Elements of Astronomy," "The Elements of Mathematics," &c. &c.

HORROR, Horrour, strictly signifies such an excess of fear as makes a person tremble. It is a compound of admiration and fear, not without an occasional mixture of pleasure, from which, when predominant, it is denominated a pleasing horror.

Horror, in Medicine, nearly synonymous with rigor, is used to denote that transient shivering, accompanied by a sensation of cold, which is among the first symptoms of febrile diseases in general. Hippocrates considers it as expressive of a lesser degree of shivering than the term rigor; but a few persons, he says, employ the word to denote a greater degree of chilliness than rigor. (See his Treatise de Fisibus.) Celsius considers the horror as a general shaking, such as often occurs in the outlet of a paroxysm ofague. "Frivus voco, ubi extremae partes membrorum inafligent; horizon, ubi totum corpus intremet." (De Medicinis, lib. iii. cap. 3.) Sennertus again tells us, that horror implies an agitation of skin only; while rigor signifies a shaking of the whole body; and this appears to be the sense in which the two words are most commonly understood. Sennert's Opera, vol. i. p. 357.

Horror of a Vacuum, was an imaginary principle among the ancient philosophers, to which they ascribed the ascent of water in pumps, and other familiar phenomena, which are now known to be occasioned by the weight of the air. See Air.

HORROX, Jeremiah, in Biography, was born at Toxteth, near Liverpool, about the year 1619. He received his academical education at Emanuel college, Cambridge, after which he began to apply himself very diligently to the study of astronomy, but as at this period his circumstances were very moderate, and as he could have no access either to books nor instruments, he was unable to make any considerable progress in the pursuit. About the year 1656 he became acquainted with Mr. Crabtree, who was a great genius, and who led him to the fame kind of studies, and with whom Mr. Horrox corresponded, and they both communicated discoveries to Mr. Foller, professor of Gruchan college. Mr. Horrox, by the countenance and assistance of his friend, pursued his studies with renewed vigour, having procured instru-
ments and the necessary books for the purpose, applied with great diligence to the making of observations. Scarcely, however, had he entered the career of discoveries, before he was suddenly cut off by death in the year 1640-1, when he was only 22 years of age. Of the losses which the world sustained by this melancholy event, some notion may be formed from the writings which his fame has left behind him. He had just completed his "Veius in Sole vis," which was published at Dantzic in 1662, by Hevelius, together with his own "Mercurius in Sole vis," and illustrated with that astronomer's notes. The remaining papers of our young astronomer were digested and published by Dr. Wallis in 1673, under the title of "Opera Posthuma," &c. Two things are deserving notice, and will perpetuate the memory of this very extraordinary young man. He was the first who ever predicted or even saw with a scientific eye the passage of Venus over the sun's disk, and though he was not aware of the great use that was to be made of it, in discovering the parallax and distance of the sun and planets, yet he made from it many useful observations and improvements on the theory of Venus. The other circumstance was this: he was the first to give a new theory of lunar motion, which Newton himself made the groundwork of his astronomy relating to the moon; ever speaking of Mr. Horrox as a genius of the first rank.

HORS de fon see, q.d. out of his see, in Law, is an exception to avoid an action brought for rent, or other service, filling out of certain lands, by him that pretends to be the lord. For if the defendant can prove the land to be without the compas of his fee, the action fails.

HORSE, in Zoology. See Equus.

The horse makes the subject of a very extensive art called horsemanship, consisting of divers subordinate arts or branches.

From the fame beall arife the proffessions of chivalry, knighthood, &c.

Authors are divided as to the time when men first began to mount horses. The scholiast of Euripides, and Euripheides on the second book of the Iliad, speak as if the ancients had been unacquainted with the use of faddle horses, and had only used them to draw chariots, &c. They add, that couriers on horse-back were not introduced at the Olympic games before the fifteenth Olympiad. But this can scarcely be; because the centaurs, to whom the invention is attributed, lived long before that time. Besides, Homer, though he mentions only chariots in his account of the siege of Troy, speaks of riding so familiarly in some parts of his Iliad and Odyssey, that it must have been practiced among the Greeks at least one hundred years before he composed either of these poems. In the sixteenth book of the Iliad he represents the strength and activity of Ajax, when he fought in defence of the Trojan ships that were attacked by the Trojans, and helped from one ship to another, by the readines and address with which a skilful horsemens would vault from the back of one horse to that of another; and his ability to defend many ships at once by that of the accomplished rider, who is capable of managing and controlling several horses at the same time. This paper disproves not only that riding was commonly known at the time when Homer wrote, but that it must have been studied and cultivated with great care and attention. In the fifth book of the Odyssey, the poet compares Ulysses, shipwrecked and sitting astride a plank which was floating on the waves, to a man bestriding a horse, and keeping his seat in spite of the motions which the animal could make. Herodotus, in Thalia, speaks of hunting on horseback, and exercitè præstis in the time of Darius; in Mela were, likewise, he says, the Amazons hunted on horse-back, with their husbands, the Sarmatians. Xenophon says, that Cyrus hunted on horse-back, when he had a mind to exercise himself and his horses.

It appears, likewise, from Pausanias, that there were horse-couriers even in the time of Hercules, the initor of the Olympic games.

It also appears, from the most ancient history extant, viz. the history of the Bible, that the horse was made subservient to the will of man in the earliest times, and therefore the use of this animal is probably almost coeval with mankind. See Gen. ch. xlvii. 17. Job, xxxix. 18, 19. Gen. 1. 9. Exodus, xiv. 9.

From the two last cited passages, in which chariots and horsemen are named together, it appears probable, that the use of chariots and the art of riding were introduced about the same time, the latter being a little prior to the former; and Egypt seems to have been the country to which mankind are indebted for the equestrian art, though the precise period of time in which it was first practised cannot so easily be ascertained. It is certain, however, that when Jacob came into Egypt, he found the inhabitants perfectly acquainted with the horse, and using it in its two-fold capacity of carrying and drawing. From hence it was conveyed to the Ethiopians, Arabs, Indians, Persians, Parthians, Armenians, Scythians, &c.

The Ethiopians, as we learn from Herodotus, possessed a breed of horses, and were acquainted with the art of riding; accordingly he describes them as a nation of cavalry that attended Xerxes in his expedition against Greece. We have no information with respect to the equestrian history of the ancient Arabs; although in later times they have become so famous for riding, that they may be cited a nation of horsemen. The inhabitants of India were accustomed to use horses from the earliest times; and Herodotus affirms, that the troops of this country, which attended Xerxes in his famous march against Greece, were fought on horse-back, as well as employed chariots in war.

The Persian horses have been always famous for beauty, vigour, fire, and other eminent qualities, and so celebrated for speed, that their very name in the language of the country signifies what may be rendered by the word "wind-foot," a term emphatically expressive of their swiftness. The ancient Persians were so fond of them, and thought the art of managing them so becoming and necessary a duty, that they taught their children to ride at the age of five years, as Herodotus relates. Vegetius describes the horses of this country as most valuable for the saddle, being vital, gentle, and very agreeable to the rider, constituting a very considerate part of the revenue of their owners, and very profitable to those who could support a fine breed. Their paces were singularly graceful, as well as fleet and gay, so as to relieve rather than fatigue the rider. They were quick and nimble, but subject to tire on a long march or journey; inclined to obstinacy and rebellion, unless curbed and subduè by discipline and exercise; but notwithstanding their heat and anger, not difficult to be pacified; always maintaining a graceful carriage, arching their neck, and bending it to such a degree as almost to make their chins lean upon their breasts; while their pace was something between a gallop and amble, anfwering to what the French call "aubin," and we a "rack."

The Parthians were very eminent for the skill with which they managed their horses, and their manner of fighting upon them; and they are described as having such dexterity and suppleness of body, and such a command over their horses, that they could turn themselves round upon their backs with so much ease and readiness as to be able to draw their bows with the surest aim, and wound their enemies.
HORSE.

even whilst they were flying from them; this manner of fighting being peculiar to them. The name of "Parthus" is derived from a Chaldean word which signifies "horseman." Their horses are said to have been very active and easy in their paces, which they formed by attention and practice. (See Paces.) The Parthian horses were very hardy, and inhabited to inaccessible ranges, as well as to travel a long time without food or water. Thus Propertius describes them (lib. iv. eleg. 3.)

"Quot fine aqua Parthus millia currat equus,"

"How many miles can run the Parthian horse,
Nor quench his thirst in the fatiguing course!"

Armenia boasted of its breed of horses, hardly inferior to the Persian race. Vegetius spoke of the inhabitants of this country as being very careful in trimming and adjusting the manes of their horses. (See Man. Nisae, a district of Armenia, boasted of its breed of very large and beautiful horses. The chariot of Xerxes, in his famous expedition, was drawn by horses of that country, which were chosen for the task, because they were the noblest that could be procured. Media was also a region eminent for its horses, and from its situation and properties, produced them of equal value with the neighbouring countries. The Scythians were proverbially famous, as in the terms "Seytha equum," for their attention to horses. They preferred mares to horses, conceiving them to be more capable of service, and accordingly used them more than horses in war. The Sarmatians, both Asiatic and European, were distinguished horsemen, and had large breeds of horses. They used horses not only for riding, but offered them in sacrifice to their gods; they also eat their flesh, and drank their blood. Lucan (l. ii.) and Virgil (Georg. ii.) record this custom. The horses of Cappadocia have been much celebrated both by historians and poets, both for their swiftness and the flatness of their action. The inhabitants of Nomadia, Mauritania, Nafamena, Masilia, and other adjacent tracts of the same region, are highly commended for having had horses of great swiftness and vigor; and more particularly for their peculiar manner of riding them, without a bridle or saddle, using a wand only, or switch to guide and command them. This breed of horses seems to have been the same with that of Lybia, or, as that tract is now called, Barbary, famous for its excellent horses, which were extolled for their speed, wind, and patience of fatigue. Xenophon, Oppian, and Arabians concur in commending them. The method above-mentioned, of guiding and governing horses by a wand or switch, is still practiced in Barbary by the lower part of people. The horses of Lybia are proverbially swift.

The colonies which came from Phenicia and Egypt, in which equitation flourished, brought this art with them, and established it in Greece long before the siege of Troy, and with the art transplanted thither the horse, which was not originally a native of Greece. The Thessalian horses were the most famous of ancient Greece, and valued and admired not only by the inhabitants of that country, but by the most judicious and experienced of other nations. Mycenae, Epirus, Lacedaemon, Argolis, Arcadia, Magnesia, Dalmatia, Ionia, the island Scyros, the Attic territories, and Elis in particular, were all distinguished by their breeds of horses. From Greece the art of horsemanship was transmitted to the Romans, who cultivated it with such diligence and zeal, that they were soon able to excel their masters. The Etrurian or Tuscan breed is praised by Oppian; and the Sardinian, Corsican, and Venetian horses are much commended. Aginugas in Sicily, and Calpe and Tartessus in Spain, are also celebrated for their horses. After Galicia, and Andalusia, then called Baetica, were known to produce the finest of their kind. The horses of Gaul were also held in considerate esteem by the Romans; and they were not unacquainted with the use of the Germans, which are mentioned by Caesar and Tacitus, but by the latter not much to their credit. Like the Armenians, the Romans always turned the mane on the right side. Varro and Virgil direct it to be so placed.

It was the custom, among the ancient, to impress some mark on their horses; the most common were, Σ, βόμα, a K, λαψί, and a bullock's head. Hence these marked with Σ's were called Σμαύροι; those with a K, Καπτέρι, and those with a bull's head, Βοπερία. It is, however, more probable that the famous horse Bucephalus owes his appellation to the resemblance which his head bore to that of a bull, and not to the impression of one which was burnt into his fleh, and was a mark in no wise peculiar to him, but common to all horses, so that he could not have been particularly distinguished by it. And Aulus Gellius, lib. v. cap. 2, expressly tells us that this was the facts; and that the head exactly resembled, in shape and figure, the head of a bull. This mark was stamped on the horse's buttecks and his banesi, as appears from the fable in Aristophanes' Clouds, Heftychius, &c.

The Romans, as well as the Greeks, distinguished their horses by certain marks, which were burnt into the flesh: there were the initial letters of the owners' names, figures of animals and other devices, by which the horses were known and appropriated, frauds prevented, and the breeds and pedigrees, of which they were very careful, preferred and distinguished. It was also usual for them to give names to their horses, expressive of their country, qualities, or colour. The Sybarites, a voluptuous people of Calabria, are said to have taught the horses in their troops to move or dance in exact time to the sounds of musical instruments.

In modern times, Arabia is most distinguished for the excellence of its horses, and the address of its inhabitants in riding them.

The Arabian breed their horses for sale, and there is a considerable revenue arising from those that are sent out of the country, the tax being about ten pounds sterling for each horse. These people are scrupulously exact in preserving the pedigree of their horses for several ages; so that they know their parentage, alliances, and genealogy, distinguishing each breed by different appellations, and dividing the whole kind into three classes. The first class is called noble, being the most pure and ancient, without any mixture, on the side of the fires or dams. The second class is composed of horses, whole race, though ancient, has been mixed with plebiscian blood, either on the male or female side, which nevertheless is deemed noble, but misshapen. The last class comprehends the common horses, which are sold at a low price; but the two former classes are extremely dear, the lowest-priced mares of the first class being worth five hundred French crowns, and some fetching even four, five, or six thousand livres.

When a flattern covers a mare among the Arabs, both being of equal quality, witnessees are called to be present on the occasion, who sign a certificate in the presence of a magistrate, in which the names of the horse and mare are mentioned, with their pedigrees. When the mare drops her foal, witnessees are called again, and another certificate is drawn up and signed; and these vouchers are given with the animal, like the deeds of an estate, when it is sold.

The Arabian horses are generally of a middling size, next
and clean in their shape and limbs, and of a thin and slender figure. Their keepers curry and feed them morning and evening; and only let them drink two or three times in the day. About March, when the grass is strong and plentiful, they fold them, and drive them to pasture; observing the different species of grass, which they are evidently derived from them, of throwing cold water upon the mare as soon as the stallion descends from her back. When the spring is past, the horses are taken from the pastures, and kept for the rest of the year without grass or hay, solely upon barley, with a certain portion of straw. When the colts are about eighteen months old, they throw the hair of their tails, in order to make it grow thicker and stronger. They begin to ride their colts at the age of two years, or two and a half at most.

The best breeds of this country are said to be sprung from the wild horses of the Desert, of which, many ages ago, a fluid was composed, which increased the breed, and furnished Europe, Asia, and Africa with these noble animals. The best horses are, therefore, immediately or remotely descended from Barths, descended from Arabians, whose climate is peculiarly favourable to the breed of horses.

The Arabian breed is propagated in Barbary, among the Moors, and even among the negroes on the banks of Gambia and Senegal, where they are fed with Indian corn, bruiued and mixed with milk. Egypt, Turkey, and Persia are supplied with horses from Arabia. The Barbary horses are to be found in most countries of Europe.

The foreheads of these horses are generally long, slender, and ill furnished with mane, but rising distinctly and boldly out of their withers; their heads lean and small, and reminding that of a sheep; their ears handsome and well placed; the shoulders light, flopping backwards, and flat; their withers fine, and standing high; loins short and striaght; flanks and ribs round and full, without having too large a barrel; their haunches long and elastic; the croup often somewhat too long; the tail placed high; thighs well turned and rounded; legs clean, well made, and thin of hair; the finishing detached from the bone, but the pattern generally too long and beuding; the foot good and sound. These horses are of all colours; but the most common is grey; they are generally cold and slow in their paces, and require to be raised and animated by the rider, when they will discover a great fund of vigour, wind, and speed. They are very light and nimble, formed for running, and are more valued in their offspring than for their own merit, being thought, when transported into foreign countries, to get colts which excel their fires in goodnes; on which account they are valuable in fluids.

The Algerines are said not to like to cultivate their horses, but only squeeze their teatsicles when they are about three months old, and thus render them incapable of propagation.

It is thought that the horses of the kingdom of Morocco are the best, and next to them a breed called the mountain barbs, which are sure-footed, of a gentle disposition, and very attentive and docile. Their walk is free and bold, and their gallop very rapid.

In Turkey, Arabia, and Persia, they expose the dung of their horses in the sun, and when it is capable of being finely powdered, they spread it under them instead of litter, which gives their coat a beautiful gloss and luster. The Persian horses are reckoned next in value to those of the Arabians. The climate of India is unfriendly to horses, which are generally very small, and fed in the day-time with a little hay; and at night with peas boiled with sugar and butter. They sometimes feed them in the rice-fields, and when flesh is plentiful, both the offal to rags, and, mixing it with butter and some of the corn, form balls, which they thrust down the throats of horses. In a scarcity of provision, they give them opium.

The horses of the country are naturally very vicious; and the Persian horses, being more gentle and tractable, are often valued at a thousand guineas each, while those of India fall for fifty or one hundred.

The Tartar horses are of a moderate size; but they are strong, nervous, proud, full of spirit, bold, and active. They are of a good size for the saddle, and are pacers by nature. Their owners, like the ancient Geloni and Sarmaions, make the animals supply them with food; for they eat their flesh at this day, as well as the curds, or "lact concrimum" of the mare's milk, mentioned by many ancient writers. The Tartars have been famous in all ages, under different names, for their love of horses and skill in riding. The district, called Little Tartary, has a breed of small horses, which the inhabitants value so much, as never to permit them to pass into the hands of strangers.

Circassia, Mingolins, and the adjacent parts, abound with horses of a better mould, and juter proportions than those of Tartary, and they are consequently admired and valued, more especially as they are equal to the greatest fatigue. Some of the islands in the Archipelago are furnished with good and valuable horses, especially Crete; but they are not entitled to any farther notice. The horses of Russia are not much regarded by other nations. They are small but hardy, and capable of enduring great fatigue. Those of the Turkish breed are handsome, and finely shaped, but too light and weak for heavy cavalry. The Kalmuck horses are somewhat higher than the Russian common horses, and so tough and strong in their constitution, as to be able to run three or four hundred English miles in three days. They frubbit, summer and winter, solely upon grass in the great deserts, which are between the rivers Don, Volga, and Yaik. They are collected in great herds of four hundred, five hundred, or even a thousand. They are excellent swimmers, and pass the river Volga, where it is from one to two miles broad, with great ease. The Nogay horses are a hardy breed belonging to the Tartars of that tribe, subject to the Kalmuck khan. The Turcoons, a free nation, living between the Caspian sea and the lake Aral, have horses of the same nature with those of the Nogay Tartars; and the horses of the Bashkirs are flatter and better than those of the Nogay tribe. The "lep," or wild horse, is an horse of the Desert, of which there are three different kinds, which feed respectively together, in herds, or taboons, of thousands. All kinds of horses are eaten by the Tartars and Kalmucks; and a foal is reputed a great delicacy. Mare's milk is a frequent drink, which, when kept and fermented, becomes intoxicating. The Tartars of the Crin never undertake an excursion without allowing three horses to one rider. The Polish horses are very hardy, strong, and useful, but they are generally of a middling size. In the marshy parts of Prussia, and towards the mouth of the Vislows, there is a breed of good, tall, strong, horses, resembling those of Friesland, but of inferior value.

The horses of Sweden are low and small, and the Norwegian breed may be comprehended under the same description, but they are nervous, hardy, and active. Denmark, and afo Holstein and Oldenburg, boast a large variety of horses, which have so much vigour, pride, courage, and grace, that for the coach, the services of war, and the manage, they can be surpassed by few, though they often fail with respect to elegance of limb and symmetry of parts; having thick foreheads,
HORSE.

heads, shoulders somewhat heavy, backs rather long, and croups too narrow to correspond with the foreparts. In the islands of Ferroe there is a race of horses of small growth, but strong, swift, and sure of foot, passing with ease and safety over high hills. They are never shod, and feed abroad without shelter both summer and winter. In Sudderok, one of these islands, they have a lighter and swifter kind than in any of the rest; the inhabitants chase their sheep, which are wild, by hunting them with a dog, and pursue them with their hounds. The hores of Lapland are small of stature, but active and willing; they are used only in the winter season, in drawing sledges over the snow, and transporting wood, forage, and other necessaries; but in summer they are turned into the forests, where they form separate troops, strictly confined to their own quarters.

The Spanish hores are much commended: some make them second to the Arabians, and place them before the Barb. Those of the finest breeds are generally well trained, and well knit horses, active and ready in their paces, of a quick apprehension and retentive memory, wonderfully docile and affectionate to man; full of spirit and courage, tempered with mildness and good nature, and generally very easy in all their paces, for little most part of a moderate size. Those which are bred in Upper Andalusia are deemed the most valuable. The Portuguese horses, or rather mares, were famous of old for being very fleet and long-winded; but of late it is said they are much degenerated. The Italian horses were formerly more beautiful, and of greater fame, than the present race. Although this country is not now delitute of many generous and beautiful breeds, dispersed in fluids, which are formed in different flats or districts, the Neapolitan horses have always been renowned, and shine both under the saddle and in the traces. Great numbers are bred in Sicily, which has always been extolled for the superior excellence of its horses. Those of Sardinia and Corsica are small, but nimble, bold, and full of spirit. The Swiss horses partake of these qualities, and were formerly accounted serviceable in war. Germany is not delitute of generous and noble horses, useful for many purposes; but they are reckoned to be heavy and not good-winded. They have, however, finer breeds obtained from Turks and Barbs, which are kept as stallions, and also from Italians and Spaniards. In the chase and running they are inferior to the Hungarian and Transylvanian horses. The horses of Bohemia are not distinguished by any eminent qualities. The Haffars and Transylvanians are accustomed to flit the noitirs of their horses, under a notion of giving their breath a free passage, and improving their wind, as well as to render them incapable of neighing, which in war would be often inconvenient. The Croatian horses are nearly allied in qualities and character to the Hungarian and Bohemian; these, as well as the Poles, are remarkable for being, as the French term it, "Bo- gnot," or keeping the mark in their teeth as long as they live.

Holland furnishes a race of horses, which are principally serviceable in the coach; the belts come from Friesland. The Flemish horses are inferior in value to the Dutch, having big heads with a channel towards the noitirs; their feet are immediately large and flat, and their legs subject to watery humour and swellings in the heels. France abounds in horses of all kinds, but by no means excels. The belts of those fit for the saddle come from Limiento: they resemble the Barbs in many particulars, and like them are fitted for hunting; but they are not ripe for work till they are eight years old. There are also very good "Bidets" or ponies in Avergne, Poitou, and Burgundy. Next to those of Limou- sin, Normandy claims precedence, for its handline, generous, and useful breed. Lower Normandy, and the district of Cotentin, furnish a very good fort for the coach, which are nimble, and have more elasticity in their motions than the Dutch horses. The French horses are apt to have their shoulders too loose and open, as those of the Barbs are too confined and narrow.

The finer and better fort of the more English horses are descended from Arabians and Barbs, and frequently resemble their fires in looks and appearance, but differ from them considerably in size and mould; being more furnished, stout, and lofty. In general they are strong, nimble, of good courage, capable of enduring much fatigue, and both in perseverance and speed pass all horses in the world. However, it is objected to English horses, that they want grace or expression in their figure and carriage; that they are obtinate and full; that they have stiff shoulders, and want suppleness in their limbs, which render them unfit for the manage. England has at all times, even in its ruinous state, been possessed of a breed of horses sufficient to answer every necessary purpose. But it is probable, that those now used in the service of war, as well as for draught, are an offspring of the German or Flemish breed, meliorated by our foal, and a judicious culture; as our race horses derive their origin from Arabia. The venerable Bede says, that the English began to use saddle horses about the year 631, when prelates and others rode on horse-back, who till that time were accustomed to walk. In the reign of Athelstan the English became so jealous of their horses, which were also held in high esteem by foreigner, that a law was made by that monarch to prohibit the exportation of them, unless they were designed for presents; and in the reign of this prince many foreign horses were introduced into this kingdom. The variety of breeds in this island was further augmented by Wil- liam the Conqueror, and particularly by Roger de Be- leme, earl of Shrewsbury, in his time, who introduced the Spanish stallions into his estate in Powis Land, from which that part of Wales was for many years celebrated for a swift and generous race of horses. (See on this sub- ject Berenger's Hiftory and Art of Horfemannip, vol. i. paffim; Buffon's Nat. Hift. by Smellie, vol. iii. p. 326, &c. Pennant's British Zoology, v. i. p. 1, &c.) The importation and breed of horses were much promoted by Edward II. and Edward III. Polydore Virgil informs us, that in the reign of Henry VII. the English were wont to keep large herds of horses in their pastures and common fields; and by 11 Hen. VII. cap. 13. it was prohibited to convey horses out of the realm without the king's licence, on pain of forfeiture. In the reign of the succeeding prince, a particular regard was paid to the rearing of a breed of good and strong horses; and accordingly several laws were made, enjoining those who had parks, meadows, &c. to keep at least two brood mares, of a certain size, &c. and prohibiting floned horses from being put into forests or commons where mares were kept within certain counties, which were above the age of two years, but not fifteen hands high, on pain of forfeiture; and fcafed horses from being kept in such places, on pain of 10s. 27 Hen. VIII. cap. 6. 32 Hen. VIII. cap. 13.

By 1 Ed. VI. cap. 12., and 2 & 3 Ed. VI. cap. 33. horse-dealers are excluded from the benefit of clergy. By these prudent and judicious measures, the English breed of horses was not only improved in strength and size, but also greatly increased in number. Till the use of coaches (see COACH) was introduced in the reign of queen Elizabeth, no horses and carts were the only methods of conveyance for all forts of people; and the queen rode behind her master of the horse, when she went in state.
to St. Paul's. By the 2 & 3 Ph. and M. cap. 7, and 31 Eliz. cap. 12, it is enacted, in order to prevent horse from being stolen or fold in private places, that owners of horse and markets shall appoint toll-takers or book-keepers, who are to enter the names of buyers and sellers of horses, &c. And to alter the property, the horses must be rid or stand in the open fair one hour; and all the parties to the contract must be present with the horse. Sellers of horses are to procure vouchers of the sale; and the names of the buyer, seller, and voucher, price of the horse, the colour, and one special mark at least, are to be entered in the toll-taker's books, and a note of the same delivered to the buyer; and if any person shall fell a horse without being known to the book-keeper, or bring in a voucher; or if any one shall vouch, without knowing the seller, or the book-keeper shall make an entry, without knowing either; in each of these cases the sale is void, and a forfeiture is incurred of 5l. The owner may seize and take his horse again, or have an action of detinue, &c. A stolen horse, though sold according to the direction of the act, may be redeemed and taken by the owner within six months, repaying the buyer what he shall swear he gave for the same. Any person killing a horse in the night-time is guilty of felony, and liable to transportation for seven years; and maiming a horse incurs the penalty of treble damages. 22 & 23 Car. II. cap. 7.

Horses in hackney-coaches are to be 14 hands high. (9 Anne, cap. 23.) If hired horses are abused by immoderate riding, &c. there lies an action of trespass on the case. The act 26 Geo. III. c. 71 requires every person who keeps or uses any horse, or place for the purpose of slaughtering any horse, &c. or cattle which shall not be killed for butcher's meat, to take out a licence at the quarter sessions, and to enute his name and the words "Licensed for slaughtering horses pursuant to an Act passed in the 26th year of his majesty King George III., to be painted or fixed over the door of such house or place; and an inspector shall be appointed by parish officers, whose duty is specified by the said act. Slaughtering horses, &c. without a licence and conformity to the requisitions of the said act, inures the guilt and punishment of felony.

The duties imposed by 43 Geo. III. c. 161, and 45 Geo. III. c. 13, on all horses, mare, and geldings, kept by any person for riding, or drawing any carriage, chargeable with the duty on carriages, appear in the following schedule.

on mules, are as follow: For every horse, mare, or gelding, not chargeable with any duty according to the preceding schedule, and for every mule, except in the cases hereinafter mentioned wherein other duties are made payable, the sum of 1s. 6d.

The duties on husbandry horses are as here stated: Any person occupying a farm at rack-rent, the rent of which shall be less than 20l. (in Wales 10l.) a year, and making a liveliness (or in Wales principally) solely thereby, or occupying any estate on any other tenure at rack-rent solely, or such other estate, together with a farm at rack-rent, the value of which in the whole shall be less than equivalent to a farm at the rack-rent of 20l. (in Wales 10l.) a year, (reckoning the value of every estate occupied by the owner thereof, or on any tenure other than at rack-rent, as equivalent to double the amount of the like farm at rack-rent) and making a livelihood solely by such his own estate, or by such estate and farm jointly or principally thereby, and likewise a profit by any trade or employment, and keeping not more than two horses, mares, geldings, or mules, bond sad for the purpose of such occupation, shall be charged for each of such two horses, mares, geldings, or mules, the sum of 2s. 6d.

The exemptions to the several duties above specified are,

1. Any horse, mare, or gelding, belonging to his majesty, or any of the royal family.

2. Any post-mater, inn-keeper, or other person duly licensed by the commissioners of stamps, in respect of any horse, mare, or gelding, let to hire by him, in any manner where the stamp-office duty payable on horses let to hire shall be duly satisfied and paid on each letting, and which shall not, on any occasion, be used for any other purpose.

3. Any person duly licensed to keep any public stage coach or carriage for conveying passengers for hire from different places in Great Britain, in respect of any horse, mare, or gelding, which shall be actually and solely employed for that purpose.

4. Any person licensed by the commissioners for hackney coaches within London and Westminster, and the suburbs thereof, to keep any hackney coaches, for any horses, mares, or geldings, kept for the purpose of drawing such coach, in respect of the duties before mentioned, and for any horses, mares, or geldings, and no more, kept for the purpose of drawing each coach licensed in respect of the duties in the former schedule.

5. Any dealer in horses, assailed to the duties hereby made payable on such dealers, for any horse, mare, or gelding belonging to such dealer, and kept bond sad for, and not kept or used for any other purpose, or in any other manner.

6. Any person who, on account of poverty, shall be discharged from the affliction made in respect of his dwelling house, in pursuance of the regulations of this act, for any horse, mare, or gelding, provided such person shall not keep more than one such horse, mare, or gelding, and the same shall not be let to hire.

7. Any rector, vicar, or curate, actually doing duty in the church or chapel of which he is incumbent, who shall not be possessed of an income of 60l. per annum or upwards, whether arising from ecclesiastical preeminence or otherwise; and who shall not keep more than one horse, mare, or gelding, for the purpose of riding, which otherwise would be chargeable with duty according to this act, except such person who shall occasionally perform the duty appertaining to any rector, vicar, or curate, without being the regular officiating minister of the parish or place in which such duty shall be performed.

8. Every person inrolled, or to be inrolled, and serving in any corps of yeomanry or volunteers, which shall hereafter be continued or formed, with the approbation of his majesty, under officers commissioned by his majesty or lieutenants of counties, or others who may be specially authorized by his majesty for that purpose, who shall have attended the exercise of such corps, five days of muster and exercise at the lead in the course of the preceding year, and who shall be returned in the muster rolls of the said corps, as required by law, and certified to have so attended, unless prevented by actual necessity (such necessity to be certified by some medical practitioner to the commanding officer of such corps), and who shall be returned in the muster roll of one of such corps, or used any horse, mare, or gelding, for service during such days of muster and exercise, shall be exempted from the payment of the duties set forth in the preceding schedules in respect of such one horse, mare, or gelding; such exemption to be returned and claimed in the manner in which exemptions are directed to be returned and claimed by this act; but every claim of such last-mentioned exemption shall be proved by the certificate under the hand of the officer commanding the corps in which such person shall be enrolled, which certificate shall, between the 5th April and the 5th May in every year, be delivered to the aforesaid officers of the parish where he shall reside; and every person claiming to be so exempted, shall be chargeable thereto, unless such certificate shall have been delivered pursuant to this act, and which certificate made up, returned, and certified, shall be deemed sufficient and valid for the purposes aforesaid; but if from any variation of circumstances, or other reason, the said form cannot be strictly adhered to, instruments of a similar import may nevertheless be received in proof, at the discretion of the commissioners executing this act for the district.

9. Any non-commissioned officer or private of any of the regiments of cavalry, or in the artillery, for any horse used in his majesty’s service.

Horse-dealers are chargeable as below stated:

Every person who shall use or exercise the trade and business of a horse-dealer within the cities of London and Westminster, and the liberties of the same respectively, the parishes of St. Mary-le-Bone and St. Pancras, in the county of Middlesex, the weekly bills of mortality, or the borough of Southwark, in the county of Surrey, the annual duty of 20l.

Every person who shall use or exercise the trade and business of a horse-dealer in any other part of England, or in Wales, or the town of Berwick-upon-Tweed, the annual duty of 10l.

For the duties of post-horses, see the article Post.

A horse is usually divided into four principal parts, viz. the fore-hand, the body or carcase, and the hind-hand. The fore-hand includes the head, neck, withers, breast, and forelegs. The body is composed of the back, kidneys, ribs, belly, and flanks. The hind-hand comprehends the rump, haunches, tail, buttocks, stifles, thighs, hocks, and the other parts of the hind legs. By another mode of division, the horse is distinguished into four parts, viz. the head, the body, and the fore and hind legs. The body is composed of the back, the kidneys, the belly, the ribs, and the flanks. The fore-train consists of the neck, the shoulders, the breast, and the fore-legs; and the hind-train of the rump, the tail, the haunches, and the hind legs. These several parts may be more distinctly understood by means of the following detail, and a reference to the Plate of Horse, which will clarify the parts of the horse.
of the under jaw: D, the face or chatrine; the fore part of the head from the eyes to the nostrils; E, the rim of the nosophis; the cartilage which forms the circular aperture of the nostrils, and terminates them above and below: F, tip of the nose; the partition which divides the nostrils, terminating at the upper lip; G to H, the bones of the lower jaw: H, the chin: I, the beard.

Gatherers. The two fore teeth.

Middle teeth. Those adjoining to the gatherers.

Corner teeth. The lower on each side.

Tusks. The two canine teeth on each side, and in each jaw.

Bars. The spaces between the cutting teeth and grinders, filled with ridges, which run across the palate.

X, the neck, which is bounded above by the mane, and below by the throat, extending from the shoulders to the head: L, the joint or tuft; that part of the mane which lies between the two ears, and hangs down on the front: M, the withers: the place where the two shoulders approach each other between the neck and back: N, the shoulders, extending from the withers M, to the top of the fore leg, or fore-leg O: P, the elbow or breast: Q, the back, reaching from the withers M, to the reins S: R, the navel: the part between the back and reins; a very absurd term, as the navel is in the lower part of the belly: S, the reins: this term is often used, though improperly, to express the whole spine of the horse: T, the flanks, which are formed and limited by the ribs: V, the loins; the hollow formed by the contour of the ribs. The mane billy is given to the part extending from V to the flank: X, the flanky: the extremity of the belly, at the termination of the ribs, below the kidneys, and reaching to the haunch-bones: Y, the haunch, formed, as in man, by the haunch-bones: Z, the crupper, which is round, and reaches from the kidneys to the tail. The tail is distinguished by two parts, the base and the neck: a, the buttocks, are situated below the crupper and the origin of the tail, and extend to the place where the hind-leg joins the body: b, the lumber-blade: c, the haunches: both of these are included by horsemens under the name of lumber. d, the elbow; e, the arm; f, the knee, or joint limited below the arm, a term improperly applied to a horse, as it corresponds to the writh in man: g, the flexor or contort: the second part of the fore-leg. It begins at the articulation of the knee, terminates at the fetlock joint i, and answers to the metacarpus in man: b, the tendon, commonly called the backbone: j, the fetlock joint: k, the joint of hair which surrounds a kind of short horn situated behind the flank: l, the patellae; the part of the leg which extends from the fetlock-joint to the hoof: m, the corneus: n, the place where the hoof joins the leg, and is decorated with long hair falling down all around the hoof: a, the hoof represents the nail in man; the fore-part of it, c, is called the toe, and the sides, s, the quarters. The hind-part of the hoof is a little raised, and divided into two parts, both included under the name heel: they extend to the middle of the under part of the foot, and uniting again under the sole, or bottom of the foot, form the freg: f, the flillum, is properly the articulation of the knee, and contains the knee-pan: g, the thigh: it extends from the flillum and extremity of the buttocks to the ham r, and answers to the leg in man. Accordingly, the horse's thigh has a flillum part a, resembling the calf of a human leg: a, the back or ham, is the joint at the extremity of the thigh, and bends forwards. This articulation corresponds with the tarsus in man. The hinder-part of the joint, called the hock, is properly the knee. What is commonly called the great flexor, which arises from the point of the hock, and terminates in the foot, is a tendon, answering to the tendo Achillis inserted into the human heel: u, the flexor: v, the patellar joint: w, the patella: z, the foot, as in the fore-leg. (Buffon's Nat. Hist. by Smelie, vol. iii.) Of most of these parts a further account will be found under the respective articles.

The malleus of this art lay it down, that a horse, to be good and well made, must have three parts like those of a woman; viz. the breast, which is to be broad, the hips round, and the mane long; three of a lion, viz. conformation, latrecipidity, and fire; three of a bullock, viz. the eye, nostril, and joint; three of a sheep, viz. the nose, gentleness, and patience; three of a mule, strength, confidence, and foot; three of a deer, head, legs, and hair short; three of a wolf, throat, neck, and hearing; three of a fox, ear, tail, and trot; three of a serpent, slenderness, flight, and turning; three of a hare or cat, running, walking, and suppleness.

Of all quadrupeds, says M. Buffon, the horis surpasses, along with grandeur of stature, the greatest elegance and proportion of parts. By comparing him with the animals immediately above or below him, we find that the ais is ill made; that the head of the lion is too large; that the limbs of the ox are too slender and too short, in proportion to the size of his body; that the camel is deformed; and that the groffer animals, as the rhinoceros and elephant, may be considered as rude and chapskef. The great difference between the head of man and that of the quadrupeds, consists in the length of their jaws, which is the most ignoble of all characters. But, though the jaws of the horse be very long, he has not, like the ais, an air of impudence, nor, like the ox, of stupidity. The regularity and proportion of the parts of his head give him a light and fragile aspect, which is well supported by the beauty of his cheet. He elevates his head, as if anxious to exalt himself above the condition of quadrupeds. In this noble attitude, he regards man face to face. His eyes are open and lively, his ears handlome and of a proper height, being neither too long, like those of the ais, nor too short, like those of the bull. His mane adorns his neck, and gives him the appearance of strength and of courage. His long bushy tail covers and terminates with advantage the extremity of his body. His tail, very different from the short tails of the deer, elephant, &c. and from the naked tails of the ais, camel, rhinoceros, &c. is formed of long thick hairs which seem to arise from his crupper, because the trunk from which they proceed is very short. He cannot, like the lion, elevate his tail, but, though pendulous, it becomes him better; and, as he can move it from side to side, it serves him to drive off the flies which infest him; for, though his skin be very firm, and well garnished with close hair, it is extremely sensitive.

The attitude of the head and neck contributes more than all the other parts of his body, to give him a graceful aspect. The superior part of the neck from which the mane fluissé should first rise in a straight line from the withers, and then, as it approaches the head, form a curve nearly similar to that of a swan's neck. The inferior part of the neck should have no curvature, but rise in a straight line from the poitrel, or breast, to the under jaw, with a small inclination forward. If it rose in a perpendicular direction, its symmetry and gracefulnes would be diminished. The superior part of the neck should be thin, with little flesh near the mane, which ought to be garnished with long delicate hair. A fine neck should be long and elevated, but proportion to the general size of the animal. When too long, the horse commonly throws back his head; and, when too short and
flethy, the head is heavy to the hand. The most advantageous position of the head is, when the front is perpendicular to the horizon.

The head of a horse should be thin and meagre, and not too long. The ears should be small, erect, but not too stiff, narrow, and pointed on the upper part of the head, at a proper distance from each other. The front should be narrow and a little convex, the eye-pits, or hollows between the eyes and ears, well filled, and the eye-lids thin; the eyes should be pretty large and prominent, clear, lively, and full of fire; the pupil should be rather large, under the jaw a little thick, but not flethy, the nose somewhat arched, the nostrils open and deep, and divided by a thin septum or partition. The mouth should be delicate and moderately split, lips thin, withers sharp and elevated, the shoulders flat, and not confined; the back equal, a little arched lengthwise, and raised on each side of the back-bone, which ought to have the appearance of being fleshy; the flanks should be short and full, the crupper round and plump, the haunches well furnished with muscular flesh, the dock or flethy part of the tail long, and thin, the thighs large and flethy, the hock round before, broad on the sides, and tendinous behind; the flank thin before, and broad on the sides; the tendon (or tendo Achillis) prominent, strong, and well detached from the leg-bone, and the fetlock somewhat prominent, and garnished with a small tuft of long hair behind; the patterns should be of a middling length, and pretty large; the coronet a little elevated, the hoof black, solid, and shining, the inlief high, the quarters round, the heels broad, and a little prominent, the frog thin and small, and the sole thick and concave. We should here add, that few horses possess all these perfections.

The three natural and ordinary movements of horses are walking, trotting, and galloping. In walking, the horse raises his feet very little above the surface; in trotting, he raises them a little more; and in galloping, still higher. The walk ought to be smart, light, and sure; the trot should be firm, quick, and equally supported; and the fore legs pushed with rapidity by the hind ones. The trotting-horse should carry his head pretty high, and keep his body straight; for if the haunches rise and fall alternately, at every movement, and if the crupper rocks, the animal is too weak for this motion. Besides the three movements of walking, trotting, and galloping, some horses have another natural motion, which is known by the name of "ambling" or "pacing;" this motion, though less quick than the hard trot or gallop, appears, at first sight, to be extremely fatiguing to the animal. The trot is, perhaps, the most natural motion of a horse; but the pace, and even the gallop, are most easy to the rider.

Horses are distinguished into divers kinds, and are differently denominated, with regard to their strain or country. As the Neapolitan, known by his hawk nose; the Spanish genet, by his small limbs; the Barb, by his fine head and deep hoof; the Dutch, by the roughness of his legs; the English, by a strong knitting together, &c. the Flandria, &c.

Horses are also distinguished, with regard to the uges or offices they are reserved for; as the coach-horse, war-horse, hunting-horse, running-horse, pack-horse, &c.

Horses are also distinguished with regard to their colours; as a bay, which admits of divers shades or casts; viz. a black-bay, brown-bay, dapple-bay; all which have constantly black manes and tails. Dun and mouse-dun, having frequently a black lift along the back, which denominates them fleabacked. Flea-black, which is white spotted with red.

Grey, dapple-grey, silver-grey, lad or powdered grey, black-grey, branded-grey, catseye-grey, and iron-grey. Griff oil or rount, a light flethy colour, intermixed with white. Peach-colour, or buff-colour. Pye-black, which consists of two colours, one of them white. Room, a bay, black, or forrel, intermixed with white hairs. Ronzas, black or forrel, with a few white hairs scattered about his body. Sorrel, common forrel, red or cow-coloured forrel; bright, or light-coloured forrel; burnt-forrel, all chiefly distinguished by the colour of their mane. Starling-colour, resembling a brownish or blackish-grey, only more flecked, or intermixed with white. Tyger-colour; much the same with the branded-grey, only the spots smaller. Wolf-colour, deer-colour, black, white, &c.

These colours are generally considered as symbolic of the nature, qualities, &c. of the beaks, and accordingly their value is much influenced hereby. The dapple-grey is prized for beauty; the brown-bay for service; the black, with silver hair, for courage; the roan for countenance; the forrel, black without white and iron-grey, are reputed hot and fiery; the bright-grey, flea-bitten, and black with white spots, are fanguine; the white, dun, and pyle-bald phlegmatic and heavy; the moufle-dun, red-bay, and blue-grey are dull; the peach-colour rarely prove obedient to the spur; the forrel seldom fail of being good, especially if their legs, tails, and manes be black; and the same may be said of the flea-bitten, at least those so marked in the foreparts, or over the whole body; or, when only behind, it is an ill sign.

Indeed, it is hard to lay down any universal rules in this cafe. The white, which promulges the leaft, often proves good, when black about the eyes and nostrils; and there are excellent iron-greys, though that is not reputed a good colour. The white colour was anciently the most admired, and considered as a mark of pre-eminence and sovereignty. Herodotus reports, that the Cilicians paid an annual tribute of three hundred and sixty white horses to Darius, king of Persia; and in Xenes' march against Greece, the chariot of Jupiter was drawn by eight white Nyfaran horses, the colour being appropriated religiously to the deity. We read likewise, in the book of Kings, that the kings of Judah were used to dedicate horses to the sun. Tacitus says, the ancient Germans had certain horses, which were white, that were consecrated to their gods. We learn also from Livy and Diodorus Siculus, that white horses were held in high estimation in Sicily and at Rome. This was also the cafe at Naples; and also anciently in our own country. Nevertheless, if we may believe Virgil and others, who pretended to prophesy the innate properties of horses by the colour of their skins, and other marks, the white should be always rejected, as having few qualities which can render them pleasing or serviceable. Virgil evidently means, not white milk-horses, but horses of a faint pale colour, somewhat bordering upon the cream-colour, or whithin dun; for he elsewhere commends the whiteness of the coats of Turnus's horses. Claudian, also Plautus, Horace, Statius, and Palladius join in celebrating it; and we may reasonably suppose that they spoke according to the fancy and opinion of the times in which they wrote.

The common marks of a dull, stupid horse, are white spots round the eye, and on the tip of the nose, upon any general colour whatever. Though the vulgar take these spots for signs of stupidity, yet it is certain they are marks of the goodness of a horse; and such horses as have them are very tenable and quick upon the spur. The French call these spots marques de ladre.

Our dealers in horses use the term mettled horse to express...
HORSE.

...press a creature of that species which has a great deal of vigour and heart, as they call it. Otherwise, there is a great difference between a mettled horse, a horse of vigour, and a fiery horse; but as this is not sufficiently attended to by gentleman in their purchases of this animal, some general rules for the distinguishing real vigour in a horse, may be acceptable in a work of this general kind.

When a horse is standing still, the rider who has a mind to try whether he has vigour in him, should keep him fast with the bridle-head, and apply the spurs to the hair of his sides; this is called by horsemen pinching. If the horse is impatient under this, gathering himself up, and endeavouring to go forwards, and changes upon the bit, without thrilling out his nose, it is a sign of vigour and right mettle in him. Some caution is to be used, however, in judging by this, to distinguish between a horse that has vigour really in him, and one that has only a fine skin, and is rather ticklish than mettled. This is the case with a great many horses, and is found by their being very sensible of the touch of the spur, and shewing the appearance of a great deal of mettle and vigour when touched, but immediately losing the apprehension of it. These are of a dull disposition, but only have a tender skin.

Pliny tells us, that if a horse, in drinking, plunged his nose deep into the water, it was reckoned a sign of spirit and courage; and this notion prevails even at present in this country.

The mettled horse is to be highly valued, but the fiery one is good for nothing; a horse that is truly vigorous should be calm and cool; he should in general move on patiently, and only show his mettle when it is required of him. The surest method is to choose such horses as are extremely apprehensive of strokes, and are afraid at the least appearance of their coming. These, at the only closing of the legs and thighs, seem to be fized with fear, and alarmed, but without fretting or fiercecens. A horse that walks deliberately and securely, and that without requiring the whip too often, will go on briskly and without fretting, will go from the walk to the gallop, and as easily from the gallop to the walk again, and continually changes upon the bit, and trots with gibbets, upon the shoulder easily, and-sorting a little through his nostrils; this is generally a creature of true metal and vigour, though it does not fit to such a fiercecens as is troublesome or dangerous. If to these good qualities a horse be well upon his haunches, and have a light and easy flop, his head well placed and firm, and the feeling of his bit equal and just, the gentleman who loves riding will seldom need to complain of the price. All the good qualities of a horse should, however, never recommend him, unless he has a good mouth, and a sensible obedience to the spur.

Horses, For the Age, Height, Teeth, &c. of, see Age, Height, &c.

Horse, in Agriculture, the general name of a well known animal employed in various sorts of team labour. There are two principal breeds of horses in this country; the race or blood kind, and the cart, plough, or team fort. It is the latter description that is chiefly useful in the business of cultivating the soil. The most beneficial varieties of these kinds, in this view, would seem to be the improved black cart-horse; the Suffolk punch-horse, the Cleveland bay-horse, and the Clydesdale horse. The first, or black cart-horse, is the common fort, met with in particular parts of the counties of Lincoln and York, becoming pretty general in those of Leicester, Stafford, Derby, and Warwick; being, in point of size, larger than any others in the kingdom; but by nature inactive and slow in their movements; besides being clumsy, and not unfrequently badly proportioned.

They are in general more adapted to heavy draughts upon paved roads or streets, than for the purposes of ploughing and harrowing the ground, or any other description of farm labour. The largest horses of this kind are mostly made use of in the drawing of drays, and other sorts of heavy work, in large towns. The size below this is that which is commonly employed in the business of the field, as well as occasionally in carriages. The smallest description of them are usually bought up for being trained to military uses. It has been justly noticed that the large black dray-horses, in point of size and fatness, do not admit of any equal; while in relation to hardiness, vivacity, and nervous energy, they rank probably amongst the lowest of their kind.

The Suffolk punch, or second variety of team-horses, when of the genuine description, is but a short, plain-looking horse, though very compact, and more active and hardy than any of the others that are met with in the southern parts of the kingdom. It is a fort that has, however, lately been much improved. When compared with the above breed, and that of the Cleveland, these horses are of but small sizes, rarely exceeding fifteen or sixteen and a half hands in height; they are, however, so active, that the cultivators in that district, as well as in Norfolk, very generally plough two acres a day in the bushy seasons with a pair of these horses, without any driver. This fort of horse is very commonly employed in the busines of farming in the southern districts of the island. They require to be well kept in regard to food, but amply repay the expense under proper management, by the value of their labour.

The Cleveland bay-horse, or third variety, is generally clean and well made in most of the parts; being very strong and active, answering perfectly both for the team, coach, and saddle. There are few horses capable of greater, or longer continued exertion in any of these intentions, than these. It is usual for great numbers of these horses to be fold in the various fairs and markets of the district in which they are met with, such as are the strongest and most perfectly formed for the purpose of carriage-horses, those which are lighter in the bone, for the purpose of riding, and the others for their use in the different operations of husbandry, &c.

The fourth, or Clydesdale horse, is a strong, active, ready animal, generally from fifteen to sixteen hands and a half in height; and probably, for the purposes of the cart and the plough, inferior to few in this country. It is supposed that we are indebted to the accidental circumstance of one of the dukes of Hamilton for this variety, who brought from Flanders six coach-stallions, some time about the close of the seventeenth century; which, by being crossed with the best mares of the kind found in the Lanark district, this fort of horse was produced. The farmers in the fourth and south-eastern parts of Scotland, are now even principally supplied with their team horses from this and the neighbouring districts. Some are fold for their use as coach and saddle-horses, and taken into the southern parts of the kingdom, as well as for team-labour.

It is flated by a late writer, that this horse is lighter in the body than the Suffolk punch, and more eagerly formed in all respects. His limbs are clean and sinewy, his neck longer, his head of a finer form, and his eye more sprightly, and animated than in either of the two former kinds. His tread is firm though tending towards the nimble; and he is capable of exerting a wonderful degree of muscular strength for a short pull without being hurt by it, which makes him particularly valuable for that hilly country, where there is a necessity for calling forth such exertions on innumerable occ-
HORSE.

eadons. He is hardy, can live upon any food, and is, perhaps, the thriftiest horse for the cart or the plough that is to be found in the island, perhaps on the globe itself. For these purposes he is peculiarly adapted by the evenness of his temper and the steadiness of his movements. For the plough he is, perhaps, every-thing that could be wished; being, in point of size, neither fo large nor fo unwieldy as to render him a burden to the till; two of these horses in the sotfelt soil, under good management, being perfectly able to draw a full furrow with ease; and for horse-hoeing, or ploughing a light soil in good order, one of the lightest forts performs the work with facility and ease. What a benefit, said the writer, would it be to the nation, were a set of judicious experiments to be conducted for a sufficient length of time, for the purpose of ascertaining the comparative powers and expense of keep of the last three different varieties of horses, so that any one might know who chose it, with certainty, the profit or the loss that would result to him from employing the one or the other, for any particular purpose that he had in view?

Besides these three different varieties of farm-horses, there are several horses of a hillier description, usually known under the denominations of Galloways, ponies, &c., which may be occasionally found useful in the busines of husbandry, though mostly too small in size for the forming of plough teams.

Whatever the variety of the breed of a horse may be, in order to be well formed, it should have the following shapes of the different parts: the head as small as the proportion of the animal will admit; the nostrils expanded, with a fine muzzle; the eyes cheerful and prominent; the ears small, upright, and placed near together; the neck, rising out from between the shoulders, with an easy tapering curve, should join gracefully to the head; the shoulders, being well thrown back, should also fall into the neck, at what is termed the points, without being perceived, which probably facilitates the going much more than the narrow shoulder; the arm or fore-thigh should be muscular, tapering from the shoulder fo as to meet a fine straight finewy and bony leg; the hoof circular and wide at the heel; the chell deep and full at the girth; the loin or fillets broad and straight, and the body round; the hips or loins by no means wide, but the quarters long, and the tail set on fo as to be nearly in the same right line as the back; the thighs strong and muscular; the legs clean and fine-boned; the bones of them not round but flat, or what is frequently termed lathy. But for the team of the farmer, the principal points to be attended to should be those of not having the neck either too long or too thick; the legs rather short and flat than round and clumsy; the fore-feet even, but not too distant; the chest wide; the shoulders strong but not high; good length of waist supported by a wide loin; the quarters full and somewhat raised; the legs strong, firm, and muscular, and the size from 15 to 16 hands in height.

It has been noticed, that horses being somewhat forelow afford them an advantage in the draught, and that a tolerable length of waist gives them speed in the walk, which is not unfrequently a point of importance in farm work. Some suppose that horses for the purpose of farming should be similar to those used in riding, only of larger sizes; and in place of being capable of walking merely two or three miles in the hour, to be able to travel at the rate of four or five; as by that means the farmer would be enabled to plough more land in a given time; and to use more dispatch in the work of the cart or waggons when necessary. The utility of a strong active horse at harvest time is well known to every one; and in the business of conveying manure to the field and market work, such properties are not less valuable.

By taking care in breeding to have the heads of horses light, handsome, and well set on, and by proper attention in crossing stallions and mares, coach and cavalry horses of high value may be produced, which, if for sale by the farmer, would, without doubt, pay him well for his trouble and expense. The breeding of good horses is not more expensive than that of bad ones, except in the attention which is necessary, though the difference in the price at the market is very great. And it is known to every one, that cart-colls become ready for sale at an early period. There can be no doubt but that coach-horses may be bred from mares of the Suffolk kind when covered by horses of the finest race or better forts, or the contrary. And should it be the wish to rear horses for sale as hackneys, it will probably be the best method to select both the mare and horse of the blood fort, or at least with each some blood, which is perhaps better than making use of full blood horses. These should be bred with well set on light heads, even and good feet, close before and wide behind; plenty of bone below the knee, and high and deep and flaming shoulders; deep in the girth, handsomely rounded in the barrel, as well as on the hips; straight in the back, but the waist long enough to give speed, with the knees and fillets proportionately strong; the tail even with the back-bone. But instead of breeding, such farmers as intend to derive a profit from this description of flock, may contently find both colts and fillies for his purpose in the different fairs, markets, and other places.

Mares, for the purpose of breeding, should always be well shaped in their different parts; have a gentle and easy disposition; be poifed of a large carcase in proportion to their heights; being pretty full in their bellies, and appearing fairly good mares and have plenty of milk. Themselves intended for supplying the teams of the farmer with draught horses should, according to some, be large limbed, clothe joined, short necked, wide chell, left ribbed, with a capacious body; the eyes should be perfectly clear, full, and pellucid, and the nostrils large and open; the disposition ought to be gentle and tractable, the constitution healthy and vigorous, free from blemishes of any kind.

The horse, in this case, should be bold and spirited, well made, and of a kindly disposition; the constitution strong and healthy, the temper good, and wholly free from any sort of vice and contamination; as upon the good properties and healthy condition of the parents, in a great measure depend the future utility and advantage of their offspring. Since general experience has fully shown that in what relates to form and other good qualities in the progeny, more depends on the mare than the horse; the usual practice of regarding the horse more than the mare is highly improper, as being disadvantageous. The form and other properties of the horse should always have as much similarity as possible to those of the mare, as in this way their joint properties may be more happily expected in the young which they produce, than by violent unnatural crossing. Where a half-bred mare, for inluence, is put to a large heavy awkward cart horse, or the contrary, the offspring must naturally turn out an indifferent mangel breed that has rarely the size and strength of the one, or the spirit, activity, and fine bone of the other. See BREEDING, LIVE-STOCK, and TEAM.

In breeding the dray-horse, left movement or activity is requisite, but more power; and the same principles are applicable in some measure to those for the waggons, though in a far inferior degree. For these uses it is important that they be strong-bred, and thick in the shoulders, without
without their lying so much backward, or rising so much in
the found, as is the case in faddle-horses.
Mares in general are not suffered to take the horse in this
country until they are from two and a half to three or four
years of age, but continue to breed till they reach a good
age: as 12 years and upwards.

The horse may be permitted to cover from the age of
two or three years until he becomes used for the purpose
by age. Stallions should constantly be kept on the
best lots of food, and be well dressed and taken care of, as
without this attention they never answer well.
The foal at which the mare commonly takes the horse
is usually from about the beginning of April, until the end
of June, the last month being generally fattened the best
period. An early foal is, however, constantly to be preferred
to such as are late.
The mare goes with foal usually about eleven months, but
sometimes exceeds it a few days. It is commonly the main
object with farmers, where possible, to have their mares ca-
vered at such times, as that there may be plenty of grass at
the period of foaling, as well as warm favourable weather,
as both are highly beneficial to the new dropped foal.

Mares are in some places wholly taken from work some
weeks before the time of foaling; but this is by no means
the general practice of the country. In the eastern and
midland counties that adjoin them, in which the breeding
and rearing of horses are more perfectly understood than in most
other parts of the kingdom, it is not unfrequently the custom
for them to work them to the very period of foaling. But there
are certainly much care and attention necessary in working mares
that are so heavy with foal: as an over heat, too hard la-
bour, a fright, or sudden jerk, or any other similar cause,
could endanger not only the foal of the mare, but also that of
the mother.

It is the custom in most of the improved districts of the
kingdom where the breeding and rearing of horses are prac-
tical, after foaling to turn the mare and her foal out into a
pasture field, where they remain for two or three weeks be-
fore the mare is again put to work either in the plough or
cart, the foal during the time being suffered to suckle at
pleasure. After having had this rest, she is again suffered to
work in the usual way, the foal being confined in some proper
place during the time.

In the intention of avoking the evils arising to the foals from bad or overheated milk, some of the Yorkshire breeders are extremely careful not to suffer the mares to go near their foals, after their return from work, until their udders have been well bathed with cold water,
and the greatest part of the milk drawn from them. There
is likewise another practice which has, perhaps, a superiority
to the above, in the same district as well as some others;
which is, as soon as the foal has acquired strength sufficient,
and is fully capable of following its mother, to permit it to
accompany her to the field during the time of working, and
to suckle there as there may be occasion.

In this way the foal has full exercise, without incurring any danger from the
over-heated milk, it being drawn off so frequently. These
are the common modes in use while the foal is suffered to
suck, which is mostly about six months, as from the time of
foaling to Michaelmas, the period at which they are
usually weaned.

In the bufiness of weaning foals it is a good practice to
confine them at a distance from their mothers in some small
folds or field for the purpose, where there is a rack and
manger, in which they may be fed with clean shaven hay, and
well dried oats, bruised in a mill. Under this treatment
they speedily forget their mothers, and become quite tract-
able and reconciled to the keeper. They should be per-
mitted to exercise and enjoy themselves in a pasture field or
paddock, contiguous to the place of confinement, during the
funny parts of the month of the day, it being dangerous to
keep them out during the night, on account of their ten-
derness.

When the foals have been weaned, the usual custom is to
put them directly into some good fresh pasture, where they
may continue so long as the weather proves mild and tempe-
rate, when, on the approach of winter, they are to be fed
with a sufficient quantity of hay, placed in the shed or hovel
in the field for the purpose, into which they can freely enter
at pleasure. The year following, in the summer, they are
removed into other pastures, often the most inferior on the
farm, where they continue until the commencement of the
enfuing winter; when they are either permitted to range in
the common pasture fields, or brought home to the yards.
It is advised by some to have the foals fed during the winter
season with a little corn twice in the course of the day; or
carrots, with hay, oat straw, &c., letting them have a well
littered feed or yard that is perfectly sheltered. Such colts as
are fed at home with green meat cut fresh for them daily dur-
ing the summer season, should have a range daily upon a field
or adjoining common, for the purpose of exercise. And the
yearling colts should be kept quite separate from the mares
with their foals.

In the management of young horses, those of the cart
colt kind are often begun with at about two years of age;
and one great object in this business is first to teach them de-
cency, by frequent leading in the halter, as well as to back
and go in the shafts or traces. But this is better delayed in
faddle colts till the third year, or the autumn preceding it;
and they should now be carefully attended to, and
have a good month given them, though some think but little
of it. They should likewise be taught to canter hand-
formly; and when they are of proper size, they may be
gently wrought in the plough or other sort of team labour.
Their going well, and being quiet in harness, render them
of more value as well as utility in the opinion of many.
The field work such horses are at first inured to, is gene-
ralty that of harrowing, to which they should seldom be
kept more than one-half of the day, when they commence
it, and afterwards only very gently, for the remainder of
the year.

It is the usual practice of the northern horse-breeding
farmers to dispense of their young stock, at two or three
years old, to those in the more southern parts of the king-
dom, who, after keeping and working them about the fame
length of time, dispense of them to the dealers in the me-
ropolis and other large places. This custom is very common,
and extremely convenient to all the different parties engaged
in it; as the breeder meets a ready and conpliant market for
his young horses at the times when he wants to be quit
of them, and is thereby enabled to carry on the breeding
system without the danger of being overstocked. And those
who are the first purchasers are able to dispense of them
to the dealers in the large cities and other places in the south,
as proper opportunities may be afforded, as they are fully
aware that a supply of young horses will reach them in pro-
per time to answer their intentions. Besides, the dealers
in the metropolis can, without the expense and trouble of
travelling into the more northern districts, where the largest
proportion of young horses is bred and reared, supply them-
theselves with such as are proper for their use in the dif-
ferent counties in their own vicinity. In the carrying on
of this business, besides the principals, there are generally two
agents or more who derive their living from it, the jobber
or middle-man, who procures the horses from the breeders and
sells
HORSE.

falls them to the farmers in the south; and the dealer in the vicinity of the metropolis, who makes the purchases from the farmers in the south, at his own risk, standing the chance of sale to the buyers in the above place; or who provides them on commission for such dealers. The young horses are mostly sold with their full tails to the dealers; who afterwards make them up by art, so as to suit their different views. They usually undergo the processes of docking and nicking, and often various other operations performed upon them. After being kept, or what is often termed made up, by having bran mashes, or those of coarse ground oats, and boiled grain, given them for two or three months, they are disposed of by the dealers to their customers in the metropolis.

The usual periods of cutting or golding colts, is either while they are quite young, or when they have attained the age of two years. This is particularly the case when it is the intention to keep them, without making use of them in labour until the enlisting spring. The most proper season for performing this operation is in the early spring months, before the weather begins to get too warm. See CASTRATION and GELDING.

For farming purposes it becomes the business of the cultivators to suit the horses in their strength and size, to the nature of the work that is to be done, as where they are disproportioned in either of those respects, or in their number, the profits of the farmer must be lessened. And where the stable economy is not correct or proper as it ought to be, and the horses of course become diseased, or where they are wrought too hard, or not kept sufficiently to their labour, as well as where they are fed without regularity; the same thing must be the consequence. In the belt arable districts in the northern parts of the kingdom, the methods of working and treating the labouring horses are, at the time of the feeding, to increase the length of the time of working in the day, and to have recourse to such food as is of a better quality, than that which is usually allowed during the winter feason. They are at this busy period commonly foddered with hay or pea-straw, with each half a peck at least of dry clean oats, or these in mixture with peas or beans, as soon as they return from the field in the morning and evening; and a certain portion of the dressings of the corn in mixture with common or cut chaff, either well soaked in cold water, or boiled, is also given every forenoon and afternoon before the work is begun again. They are consequently, during the laborious part of this intercalf feeding, fed regularly four times in the day with corn. But in their northern parts of the island, instead of executing the whole of the diurnal labour constantly; in what is termed, in the south, one journey; the farm horses, from the middle of March to the end of September, make two journeys. This is considered by some as being a superior mode of proceeding, in consequence of the work being more divided, and the horses resting some hours in the moat hot parts of the day.

During the summer, except in the time of labour, the team horses are kept in the stable, and permitted to have as much cut clover as they can eat. But in the wheat feed feason, and at the time the grain is conveyed to the stack yard, a portion of corn is allowed, and which is continued in more full quantities, as long as the weather keeps suitable for the operations of the plough. In the winter feason, when the labour of the team is greatly diminished, the horses have straw with about half a peck of corn in the day. But on some farms the allowance of corn is wholly withdrawn, and properly cleaned potatoes made use of in its place. It is constantly the practice to have these horses carefully cleaned and drested, and as much under the eye of the farmer as possible. See HORSE-KEEPER and TEAM.

It is necessary likewise to be very attentive to the feet and shoes of team horses; and the improved methods of fixing and forming them should he had recourse to. Nothing should be pared from the sole or other parts except the rotten loose matters. See SHOEING of Horses.

Some attention is likewise necessary on first turning out horses to graze. It is probably the best practice to move them to the change gradually, by only letting them remain in the field for a little while on their being newly put to the grafs; afterwards increasing the length of their stay, as there may be occasion. It is probably the best time to turn them out in the evening, though the usual time is in the morning. See GRAZING and PASTURE.

Horse, Airing of. See AIRING.

Horses, Backing of. The first backing of a horse is a thing of great consequence, as its value afterwards very much depends on it. After a colt has been exercised some time, morning and evening, and becomes somewhat obedient, he is to be taken to some ploughed lands, the lighter the better; he must be made to trot over these in the hand, by that means to tire him and make his ponnets. When this is done, care must be taken that all the tackling be good and firm, and every thing in its due and proper place; then a person is to hold his head, and another to mount him; but this must not be done suddenly, or at a jerk, but very gradually and slowly, by several half raisings and heavings. If he bears this patiently, the person is to let himself firmly on his back; but if he be troublesome, and not tamed enough, the person is to forbear the attempt to mount, and he is to be trotted hard in the hand over the same ploughed lands again, till he is willing to receive the rider quietly on his back. When this is done, the person who is on his back must cherish him, and the man who has his head must lead him a few paces forward; then he is to be cherished again. The feet are to be fitted well in the stirrups, and the toes turned out; afterwards the rider is to shrink and move himself in the saddle, and the person who holds his head is to withdraw his hand a little further from the mouth. As the rider moves his toes forward, the holder must move him forward with the rein, till he is made to apprehend the rider’s motion of body and foot, which must always go together, and with spirit, and will go forward without the other’s assistance, and lay upon the reins of the rider’s hands.

When this is accomplished, let him be cherished, and have grasses and bread to eat; and then let the rider mount and slight several times, cherishing him between each time; and thus he is to be managed till he will go on, or stand still at pleasure. This being done the long rein may be laid aside, and the band about the neck, which are always used on this occasion, and nothing will be necessary but the tanches and cavesson, with the martingal. A grooms mule lead the way before; or another horse going only straight forwards, and making it stand still when desired. In this manner, by sometimes following, and sometimes going before another horse on the trot, the creature will by degrees be brought to know that it is his business to be quiet and governable. See FOAL.

Horses, Breeding of. In order to have a good and beautiful race of horses, it is necessary to choose for a stallion a fine barb, free from hereditary infirmities; such as weak eyes, bad feet, paws, purples, or the like. Disorders that arise from accidents are of no consequence; nor is the horse to be at all the less valued for them as a stallion. Three months before this horse is to cover a mare, he shou’d be fed with found oats, peas, or beans, or with coarse bread, and a little hay, but a good quantity of wheat straw; he shou’d be led out.
HORSE.

but twice a day to water all this time, and after every watering walked about an hour, but not over-heated. If he be not prepared and put in heart in this manner, the colts will be weakly, and the horse himself will be spoiled, growing purfy and broken-winded.

If he is put to too many mares, he will not last long; his mane and tail will begin to fall off through weakness, and it will be difficult to get up his flesh again by the next year. The number of mares should be proportioned to his strength, and twelve, fifteen, or at the most twenty, are as many as a horse will well serve for in a season. Mares go with foal eleven months, and as many days over as they are old. This being certainly known, it is easy to contrive so that all the foals may be brought forth at a time when there is plenty of grass. About the end of May the mares are to be put into an inclosure capable of feeding them as long as the stallion is to be with them, or that they are in foalion. In this inclosure all the mares to be put together, as well those which are barren as others. The stallion's hind shoes are to be taken off, but the fore-shoes should be left on to preserve his feet; then lead him forth, and let him cover a mare twice in hand, to render him more tame and gentle. After this take off the bridle and turn him loose among the rest, where he will become familiar with them, and not one of them will be horfed but when they are in foalion. There should be a little lodge built up in some part of the inclosure, and peas, beans, oats, bread, and other good food, put into the manger in it, that the horse may retire into it in the heoching heats, and eat what he likes best. He must be thus entertained during the whole time he is with the mares, which is to be about five or seven weeks.

Mares that are very fat and grofs do not hold well, but those which are moderately fat conceive with the greatest success and ease. To bring a mare in foalion, it is a common thing to give her a quart of hemp-feed, or twice that quantity, night and morning, for eight days before she is brought to the horse. If she refuse it alone, it may be mixed with beans or oats, and will go down; and if the stallion eat of it also, it will make him the better.

The stallion should not cover before he is six years old, nor after he is fifteen. A mare should never be covered before she is three years old; they should be always found and healesful, and of a good breed; such as these will bring forth better and finer foals than any others. The colts produced from these, are not to be used for stallions; for they will degenerate, and the race will soon become exactly our own country breed. If a barb is not to be had, a Spanish horse is to be chosen. See MARE, and STALLION.

Horses, Diseases of. See BOTTES, CONSUMPTION, COUGH, FAVY, FEVER, GLANDERS, GRIFFES, HORSE-worm, &c.

The horse is likewise in some cases subject to the fome.

Horses, Eyes of. See EYES OF HORSE.

Horses, Fattening of. The being able to do this speedily is one of the greatest arts our dealers have, and indeed is one of the greatest niceties in the whole management of these animals. Many methods have been preferred; but the following seems most to be depended on; take elecampane, cummin-feed, tamarisks, and aniseed, of each two ounces; common groundel, one handful; boil all these very well, with two handfuls of garlic, scraped and cleaned, in a gallon of good ale; strain the liquor well off, and give the horse a quart of it every morning made hot; keep him warm after it. After he has taken this for four or five mornings, he may be turned out to grass, or kept in the horse, as the foalion will permit. But when the provender is given him, a quantity of powder is to be prepared of equal parts of cummin-feed and elecampane, and give him half an ounce of it every time, sprinkling it in by degrees as he eats, that he may not manate the whole.

If this method does not succeed in a short time, then take two spoonfuls of diapente; brew it in a pint of sweet wine, and give it the horse for three mornings. This will take off any inward sickkness, and make the other things take effect. After this feed him with good provender three times a day; that is, after his watering in the morning, after his watering in the evening, and at nine o'clock at night. If he does not eat the provender well and freely, it must be changed for some other kind. If all this does not succeed, let the horse be blooded; and then take half a bushel of coarse barley meal, put it into a pail-full of water, and stir the whole together very well; then let it settle by standing. Pour off the clear liquor into another vessel, and let him drink it for his common drink, and eat the remainder, which falls to the bottom of the pail. If he refuse to eat this alone, there may be some bran mixed among it. This should be given him three times a day, morning, noon, and night. If he does not rightly take to the meal with the bran, some oats must be mixed with it, and this will readily bring him to feed on it. But whichever way is used, they must be by degrees diminished in quantity, till at length he is brought to eat the meal alone; for that is the thing that must fatten him up. Care must be taken that the barley is ground fresh every day as it is used, for it quickly grows four; and when this has once been the cafe with one parcel, no art will ever bring the horse to touch any of it afterwards. Scare any horse but will be well fatten by keeping him to this diet for about twenty days.

Barley ground in this manner cools and purges the creature; but the greatest efficacy, as to the fattening of him, lies in the water, which by this management takes up all the rich part of the barley into itself. When the horse grows lusty on this diet, it must be taken from him by degrees, giving him at first oats once, and barley-meal twice a day; and then oats twice, and the barley-meal once, till he is perfectly weaned from it. In the mean time he must have good hay, and he must not be ridden; only it will be proper to walk him gently about an hour or two in the heat of the day. If it be found that the horse wants a good smart purging during the time of his continuing on the barley-diet, the best time to give it him is after the fifth eight days, and the following is a very proper sort of physic: take of the finest ales one ounce, agoric, in powder, half an ounce; the powder of Florentine orrice, one ounce; let all these be mixed together, and put into a quart of milk, warm from the cow. This will work very briskly; and after it is over, the usual diet is to be continued. If horses of value were to be kept to this diet once a year, it would make them lefs hot and dry, and not subject to many diseases which they are troubled with at present, and would be particularly useful after campaigns and long journeys. It the horse loes his appetite by this diet, it will be proper to tie a chewingball to his bit, renewing it so often, till at length he begins to feed heartily on the barley; for these balls at once restore appetite, and are themselves of a fattening nature. See CHEWING-BALLS.

Horse on a journey, Management of a. The common method of travelling in England being on horseback, it may be proper to give some general rules for keeping the creature found, and doing the business agreeably, without many of the accidents which usually attend it.

Care must be taken that the shoes be not too small, and do not pinch the horse's feet any way; but be well styled, and fit easy. It is proper to have them put on fresh a few days before the journey, that they may last well, and that
HORSE.

they may be fastened to the feet before the setting out. The
bridle is next to be examined; that the bit of it be proper,
and not too heavy; for if it be, it will incline him to carry
low when he grows tired, and rest upon the rider's hand;
this is what they call the using a fifth leg. It is a very dif-
agreeable thing, but may often be avoided, only by taking
a proper care of the bit. The mouth of the bit should rest
upon his bars, about a fingers' breadth from his gum, but
as not to make his lips uneasy. The curb should rest in the
hollow of his head, a little above the chin; and if it gall him,
the place must be defended with a piece of buff or other
sort of leather.

The next thing to be regarded is the saddle; and proper
care must be taken as to this, that it do not rest either upon
the withers, reins, or back-bone; and that one part of it,
do not press upon the back, any more than another. Some
riders call a horse's sides below the saddle with their stirrup-
leathers. This is more likely to happen to a lean horse; and
to prevent it a leather strap should be fixed between the
points of the fore and hinder bow, of the saddle, and the
stirrup-leathers should be made to pass over these leathers.

It is always best to begin a long journey by short stages;
and this is the more necessary, if the horse has not been ex-
ercised for some time before. If it be a horse that is rid-
en, he should be suffered to flake as often as he likes, and
even invited to it; but, if a mare, she is to be less indulged
in it as being necessary, and often diminishing her strength.
It is always advisable to ride very softly for a quarter of an hour,
or half an hour, before coming in to the inn at night, that
the horse may not be over-hot when put into the stable; but
if the halt of the journey will not admit of this, the horse
should be walked in some person's hands, to cool him gently
before he is put up.

If the weather is cold, a cloth should be laid over him
while he is walked; and when taken in, his whole body
should be rubbed and dried with straw. Some have a cu-
tom of ordering their horses' legs to be rubbed well down,
on their first coming in; but this is very prejudicial while
the horse is hot, and should always be left alone till he is per-
fectedly cooled.

As soon as the horse is cooled, and ceases to beat in the
flanks, the bridle is to be taken off, the bit walked, and hay
given him; that he may eat at pleasure. The dust in very
dry weather will sometimes clog up the tongue of the horse
in such a manner, that he cannot eat without great difficulty;
in this case some bran and water should be first given him to
wash his mouth, or the servant should do it with a wetted
spunge.

There are the proper methods when the horse has been
rode moderately; but when he has been hurried at a great
rate, the faddle is to be taken off as soon as he is put up,
and the sweat rubbed off with a sweat-knife; and then the
whole body and legs are to be rubbed carefully down, and
the head is to be wiped with a cloth, as also the back under
the faddle, and the thighs; then the faddle should be clapped
on again, and the horse gently led up and down, till cool
and dry. The feet are also to be examined, to see if a shoe
be wanting, or if any of them press upon the sole; and the
dirt, gravel, or other foulness is to be picked out from
between the shoe and the foot. The openings of the feet
may be flopped with cow-dung, and the hoofs, if brittle,
should be anointed with some fatty substanse just at the
setting on; and in dry weather they should be greased, not
only at night, but noon. Many horses, as soon as un-
briddled, will lay themselves down, instead of eating.

Many are apt on this to suppress the horse's tick; but it is
generally owing only to the heat and pain they find in their
feet, which renders them unable to stand upon them. In
this case, if their eyes are examined, they will be found
brittle and good; and the hay being offered them as they lie,
they will eat it greedily. This fluws there is no inward
disorder, and the heat and tenderness of the feet, if ex-
amined, will shew that they are the parts in pain. The prin-
cipal thing to be done in this cafe, is taking care that the
horse be not ridden on the soles. This is not easily known,
but by taking off the shoes, which in cafes of extremity
should always be done; it will then be found where the sole
is touched by the shoe, being in that part more smooth and
shining than elsewhere. In this case the feet are to be pared
in those parts, and then the shoes are to be fixed on again,
annointing the hoofs, and stopping the soles with hot black
pitch or tar.

These are the means by which travelling will be rendered
safe and commodious both to the rider and the horse; but
there is some care also to be taken of the creature, after he
comes off from a long journey. The first thing to be done
is to draw the two heel-nails of the fore-feet, and if the
shoe be large, then four should be drawn; two or three
days after the horse should be brooded, and for ten or twelve
months after this he should be fed with wet bran, without any
oats; but he is to be kept well littered. The reason of
drawing the heel-nails is, that the feet are apt to swell after
journeys; and if this is not done, the shoes press upon them
in that part, and become very uneasy to them. It is advisable
to flop them also with cow-dung for some time; but they
are in the wrong who pare them down after taking off the
shoes, for the humours being all in motion after this, they
are apt to fall into the feet.

If there appear any danger of the creature's legs swelling
after the journey, it may be easily prevented by this means:
take a quantity of the dung of an ox or cow fresh made;
mix it with so much vinegar as will reduce it to a soft pate,
and add to it a handful of salt; with this rub all the hips
thoroughly up to the knees, and let it dry on; give the
water in a pail that evening, that the legs may not be wetted,
and the next morning the horse is to be led to water, and the
whole remaining matter washed of. The jockeys have a
very cunning trick to recover the hoofs of a horse injured
by a long journey: they make a hole in the foot, and fill it
with moistened cow-dung; they keep this in it a month, and
the continual moisture occasioned by it makes the hoof grow
very quick, and soon recover the proper dimensions; but it
soon after dries and shrinks so, that the foot is straightened,
and the whole hoof becomes brittle.

Cow-dung, applied to a horse's foot, always mollifies the
sole; but it dries up the hoof if continued any length of
time to it. The best method of recovering a horse's hoofs,
is to make a hole in the flable floor, filled with blue clay
a little wetted; in this the horse should keep his fore-feet a
month; this will have more effect than a small portion of
cow-dung in the foot; and the effect will be of so different
a nature, that the hoof will be rendered more tough than
before, instead of being made brittle by it.

Most horses that are fatigued, or overworked by long
journeys, have the flanks altered by it, without beingparsed;
especially horses naturally vigorous, which have been worked
too violently. The best remedy in this case, is to give the
horse half a pound of honey in the morning, mixed among
a feed of scaled bran; if he eats the half pound readily,
give him a pound the next morning; continue this till the
honey ceases to purge the creature; after this, powder of
Inquirce may be added to the scaled bran, and this con-
tinued some time, and two or three glyyters, at convenient
distances of time, will be found very invincible. If the horse
is
be very lean, it will be proper to give him some wet bran over and above his proportion of oats; and grafs is also very proper, if the creature be not inclined to be purfy. This caution, however, is to be had at all times, that excessive feeding may be bad, by subjecting the horfe to the farce. When the horfe begins to drink heartily, it is a sign that he will soon recover. Though this sometimes fails, it is a good general rule. When a horfe comes tired into a stable, fresh litter has the vertue always to occasion him immediately to flae. This is known to be a very great advantage to a horfe in a tired state; and when the litter is old and dirty, it never has any such effect upon him. If the owners knew how refreshing it is to a horfe to dislare his urine on his return from labour, they would be more careful in giving him all means and occasions of it than they are. This flating after fatige prevents those obstructions in the neck of the bladder or urinary passages, which horfes are too subject to; the bladder being often inflamed by the long retention of the heated urine in it, and the creature perifhing by it. Some of our farmers act wrong in this cafe of the litter, not through carelesness or accident, but by principle; they order the old litter to be left a long time in the flables, that it may be impregnated with more and more of the urine, &c. of the animal, and be made richer for the fields. It is not to be doubted but the manure is greatly improved by this; but the damage done to the horfe by it, is greatly over-proportioned to the benefit. The heat which the dung acquires, by thus lying together, spoils the feet of the creature, and makes it unfit for any fervice, and occasions many diftempers, which are ignorantly continued and increafed by the continual addition of heat in the fermenting dung, till at length the horfe perifhes.

Thofe who have any concern with horfes know, that it is sometimes very difficult to make them lie down in the flable. The following fimple method is propofed for this purpofe by a noted dealer. When you have a mind to make him lie down, take a piece of ftong pock-thread, or a cord, and tie it as tight round the horfe's tail as poiffible, without breaking the skin, and as near as you can to the rump-bone; this will give him a pain in the back, and he will be glad to change his poiffure, to get fake; and when he finds he cannot in any other way procure it, he will lie down, which he will find the moft eafy poiffure, and he will of courfe take a liking to it.

HORSES. Watering of. Whilft a perfon is on a journey, the horfe should always be fuffered to drink of the firft good water he comes to after feven o'clock in the morning in summer, and after nine or ten in the winter. Moderately pure water is to be preferred, that being belt of all which is neither too clear nor penetrating, nor muddy and flinking. Though it is the custom in England to run and gallop horfes after drinking, which we call watering courfes, and which we fuppofe brings them into wind, yet Sollyfel, and many other thofe of the best judges of horfes, tell us, that it is one of the worft and molt pernicious practices that we can be guilty of; no good can accrue from it, and many horfes are rendered purfy by it.

While a horfe is drinking, the rider fould draw up his head five or fix times, making him move a little between every draught. The rider need not be afraid of giving him water, with proper moderation, even in almost any circumstances. If he be warm and sweat very much, yet if he is not quite out of breath, and there are four or five miles to ride, he will be better after drinking a little, than if he had drank none at all; only obferving, that if the horfe were very warm at his going into the water, his pace muft not be less than a moderate trot when he comes out, that he may not be chilled.

In the time of a journey the horfe ought to be fuffered to drink in this manner of the waters that come in the way, as often as may be; for if the rider happens to bathe when he is hot and fweaty, he muft not be fuffered to drink for a long time, as it would endanger his life; and if he has not watered in this manner on the road, his lining is not likely to often prevent his eating, and he will not be able to touch any fort of food for an hour or two, which is usually more time than the rider can flay: and yet without eating at baiting times, he will not have strength to go on. The giving him water on the road will, on the contrary, keep him ready for food whenever it is offered him, and the rider need flay no longer than his own refreshment requires. The horfe eating immediately, and being readily qualified to go on again.

If there be any shallow water in the way a little before the coming to the inn where the horfe is to refl all night, it is always proper to ride him in, and not only give him a little drink, but ride him about feveral times, not quite up to the water; this will clean his legs, and prevent humour from falling down into them. If the horfe be very warm, and there has been no convenience of watering him upon the road, the oats that are given him fhould be firft steeped a while in ale; this will induce him to eat, though he could not have touched any that were wholly dry.

Many are of opinion that horfes are sometimes spoiled by giving them oats before their water; but Mr. Sollyfel affirms, that though it be not the custom to give oats till afterwards, yet it never does any harm to feed the horfe with them both before and after drinking; and that it is often proper and neceffary, efpccially when the horfe has been hard rid, and is warm.

Horse, Draught, in Farming, a fорт of coarse-made horfe defined for the fervice of the cart or plough. In the choice of these horfes for what is called the low draught, they are to be feleoted of an ordinary height, for otherwife when put into the cart one draws unequally with the other. The draught-horfe fhould be large bodied and firong-joined, and of fuch a disposition, as rather to be too dull than too brilf, and rather to crave the whip than to draw more than is needful. Mares are the fitteft for this ufe for the farmer, as they will be kept cheap, and not only do the work, but be kept breeding, and give a yearly increafe of a foal. They fhould have a good head, neck, breath, and shoulders; for the ref of the ifhape it is not of much confequence. Only, for breeding, the mare fhould have a large belly; for the more room a foal has in the dam, the better proportioned it will be. Draught-horfes fhould be always kept to that employ. Some put them to the farde on occasion, but it does them great harm, alters their pace, and poifons them for labour. The draught-horfe ought to have a large broad head, becaufe horfes of this ifhape head are lefs fubjeft than others to difeafe of the eyes. The ears fhould be fmall, ftraight, and upright; the noifils large and open, that he may breathe with the more freedom. A horfe with a full and bold eye always promises well. On the other hand, a funk eye and an elevated brow are bad figns. The horfe is efteemed fitteft for this purpofe alfo, that has a large and round button, which neither links down nor cuts. He muft have a firm and firong tail, and the dock muft be thick and well furnish'd with hair, and placed neither very high nor very low. The legs fhould be rather flat and broad than round; the roundnes of the leg being a fault in a horfe defined to labour, that will soon ruin him. As to the hinder legs, the thighs fhould be fleshy and long, and the

Vol. XVIII.
whole muscle which flows itself on the outside of the thigh should be large and very thick. No country can bring a parallel to the size and strength of our horses destined for the draught. In London there are innumerables of single horses that are able to draw on a plain, for a small space, the weight of three tons, and which can with ease, and for continuance, draw half that weight. The pack horses of Yorkshire usually carry a burden of four hundred and twenty pounds, over the highest hills of the north, as well as the moot level roads; but the most remarkable proof of the strength of our British horses is derived from that of our mill-horses; some of which will, at one load, carry thirteen measures, which, at a moderate computation of seventy pounds each, will amount to nine hundred and ten pounds. Nothing is so essential to the health of these serviceable creatures as cleanliness; if they are fed ever so well, and not kept clean, they will be subject to numerous diseases.

The servant who has the care of them ought to be up very early, and to clean the racks and mangers from all filth. The currying of them ought to be carefully performed every morning, but not in the stable, for the duff to fill upon the other horses, as is too often done. After the horses are dusted, they should daily twist a whip of straw hard up, and wetting it in water, rub the legs, shoulders, and belly with it. Many of the dilettos of soft-horses, which are not owing to filthiness, are owing to bad water; such as is too raw, too muddy, or too cold, being all improper. If there be any running stream in the neighbourhood, they should always be led to that to water, every day in summer, but in winter, water-water is warmest, and is better for them. If there be a necessity of giving them well-water in summer, it must be drawn up some hours before the time, and exposed to the sun-beams in tubs or troughs; marsh-water, or that of lowland ditches, is worst of all. When the labouring horse has drank his water, he should have his oats given him, and these should be carefully sifted, and the manger dusted first. It is a common practice as soon as a horse is come in from his work, to rub down his legs with a hard whip of hay, but the best judges of horses absolutely condemn this, and observe, that this rubbing of the legs after hard labour, brings down humours into them, and makes them stiff. If the rubbing itself is wholesome, but the doing it when the creature is hot is the mischief; while a horse is in a sweat it is a great relief and refreshment to him to have his body rubbed down, but when he is cold is the proper time to rub his legs. The racks are to be well supplied with hay, and the horses should be left to eat and card, about two hours, and then led to water; after this their oats should be given them, and they should then go to work again.

In the evening, when the labour of the day is over, the first thing to be done, is to examine the feet, and see if any thing is amiss about the shoes, and what earth or gravel is lodged in the foot, between the shoe and the sole, is to be picked out, and some fresh cow-dung put in its place, which will cool and refresh the part.

A very material thing for the preservation of all forts of cattle, but of none so much as draught-horses, is fresh and clean litter.

Horse. Hunting. See HUNTER.
Horse. Racing. See RACING.
Horse. Stone. See STALLION.
Horse, War. The proper rules for chasing a horse for service in war are these: he should be tall in stature; with a comely head, and outswelling forehead. His eye should be bright and sparkling, and the white part of it covered by the eye-brow. The ears should be small, thin, flort, and pricking; or, if long, they should be moveable with ease, and well carried. The neck should be deep, and the breast large and swelling. The ribs bending, the chine broad and straight, and the buttocks round and full. The tail should be high and broad, neither too thick nor too thin; the thigh swelling; the leg broad and flat, and the pattern short. When such a horse is chosen, he must be kept high during the time of his teaching, that he may be full of vigour. His food must be sweet hay, and good clean oats, or two parts of oats, and one part of bran or pear, well dried and hardened. The quantity should be half a peck in the morning, and the same quantity at noon, and in the evening. Upon his resting days he is to be drest between five and six in the morning, and watered at seven or eight. In the evening he is to be drest at four, and watered about five, and he must always have provender given him after watering; he must be littered about eight, and then must have food given him for all night.

The night before he is ridden all his hay is to be taken away about nine o' clock, and he must have a handful or two of oats about four in the morning; when he has eaten these, he is to be turned upon the manger, and rubbed very well with dry cloths; then fed, and tied to his manger. When he has performed this, he is to be brought sweating into the stable, and rubbed down with dry whips. When this has been done, the saddle is to be taken off, and he is to be rubbed down with dry cloths; the housings-cloth is then to be laid on, and the saddle being again laid on, he is to be walked gently about till thoroughly cool. After this, he must stand without meat two or three hours, then he must be fed; and in the afternoon he is to be rubbed and drest as before, and watered in the usual manner.

Horse, River, in Zoology. See HIPPOPOTAMUS.
Horse, Sea. See HIPPOCAMBUS.
Horse is also used in the Military Language, to express the cavalry (see CAVALRY); or the body of soldiers who serve on horseback.

The horse includes horse guards, horse grenadiers, and troopers. Dragoons are also frequently comprehended under this name, though they fight on foot as well as on horseback. See DRAGOONS, GRENAIDIERS, AND GUARDS.

Horse guards, by the Spaniards called guardar e cavallo; by the French, gardes de corps; by the English usually life-guards; are the guards of the king's person and body.

The duty is, by parties from the guard, to attend the king's person when he goes out near home; an honour which has been lately appropriated to the light-horses. On state days he is attended by detachments out of the horse and grenadier guards.

One of three captains of the horse-guards attends on the king when he walks on foot, immediately next his person; carrying in his hand an ebony staff, or truncheon, with a gold head.

Horse-Artillery, a comparatively novel institution in the Military Art, by which the force of cavalry and ordnance is united with the most rapid movements, executed with machines that were once so cumbersome. This new artillery is organized on such principles as to perform movements the most rapid and the most unexpected. Thus it can proceed with celerity either to a point threatened by the enemy, or a post which, by a decisive attack, is intended to carry; follow the horse every where, if needful, and crush the enemy by the combined effect of all the means of attack and defence which the theory of the military art, judgment, and experience can suggest.

In the campaigns of 1757-8-9 against the Russians, it often
often happened that the Prussian light-horse, at the very moment when they imagined themselves to be sure of success, met with a battery of cannon, though no infantry were present, which led them to suppose that the Russian had hoisted artillery, able to follow all the movements of the horse. The fact being ascertained, Frederick the Great introduced this artillery into his army in the spring of 1759, at his quarters at Reichenendorf, near Landshut, where every morning he exercised this new corps himself, and directed its manoeuvres. The king also made a successful trial with his horse-artillery before he left that camp, by covering it with a reconnoitring party beyond Liebau, on the retreat of his dragoons, in a manner to effectually, that all the attacks of the enemy's horse, though far superior in number, completely failed. The Austrians were the first who instituted this new military establishment: in 1783 they maneuvered with horse-artillery near Prague; and since that time, it has been introduced into the British, Swedish, Saxon, and Hanoverian armies; yet with considerable difference as to the calibre of the ordnance, and the way of mounting the artillery-men. The Prussian horse artillery consists of eight-pounders, the Austrian of light three-pounders, the Hanoverian of heavy three-pounders, the Danish of one-pounders, &c. The Prussian artillery-men are on horse-back; the Austrians ride on the carriages of the guns; the Hanoverian party ride partly on horse-back, partly on the gun-carriages, wurlts, &c. But no European power has hitherto derived such important advantages from this new artillery as France, where it was introduced in the year 1792, and soon carried to great perfection. In order to give it the advantage of a superior fire, the French flying, or horse artillery consists of eight-pounders, and six-inch howitzers; the ammunition is carried in light caissons, and most of the artillery-men are mounted, whilst others ride on the wurlts. By this arrangement, in addition to the known abilities of the French cannoners, the Republican horse-artillery soon acquired a decided superiority over that of the Austrians, and maintained it during the whole war. The formation of the horse-artillery in France took place in the year 1791, under royal orders carried into effect by M. Duportail, minister at war, who directed that two companies of artillery-men should be established by the commander of the military division at Mentz; and a short time before the declaration of war in 1792, M. de Narbones, who had succeeded M. Duportail, assembled a military committee, consisting of the most experienced officers in the artillery and engineer departments, aided by the advice of the generals commanding the three grand divisions of the whole French army, and sifted a number of resolutions for giving effect to this institution. It was determined, that with regard to the mode of being armed, equipped, accoutered, &c. the mounted artillery was to differ from the field ordnance only by the rapidity of its movement; on this account the horses were to be strong and active; and moreover it was considered most advantageous to the service to mount the cannoners on horse-back, in preference to artillery carts; and that without absolutely excluding pieces of larger calibre, eight or twelve pounders and howitzers seemed best adapted to the nature of this service. It was also resolved that it would be superfluous to drill the mounted artillery-man, so as to make him master of all the cavalry manoeuvres; it being thought fully sufficient for him to fit his horse well, to be able to mount and dismount with celerity, to guide his horse according to the position of his piece, and to leave it entirely to his own judgment to act with the cavalry, should he find himself involved in their manoeuvres. The British government, which was among the first in adopting this military institution, established a Brigade of six troops of horse-artillery, consisting of a colonel, two lieutenant-colonels, one major, five captains, five captains-lieutenants, twelve first lieutenants, six second lieutenants, one adjutant, one quarter-major, one surgeon, four adistant-surgeons, one riding-major, fix sergeant-major, seven quarter-major-serjeants, eighteen serjeants, eighteen corporals, forty-two bombardiers, five hundred and eighty-two gunners, four hundred and twenty-six gunner-drivers, twenty-four farriers, fix smiths, twelve colonn-makers, fix wheelers, fix trumpeters, fix hundred and eighteen riding-horses, and eight hundred and fifty-eight dray-horses.

**Horse, Hungarian.** See CAVALRY and HUSSARS.

**Horse, Light.** See CAVALRY.

**Horse, Master of the.** See Master of the Horse.

**Horse** is also a term used in various arts and manufactures, for something that helps to sustain their work from the ground, for the more commodious working at it.

The horse used by tanners and skinner, also called the leg, is a piece of wood cut hollow and roundish, four or five feet long, and placed atope; upon which they pare their skins to get off the dirt, hair, &c., &c.

**Horse** is also used, in Carpenter, for a piece of wood jointed across two other perpendicular ones, to sustain the boards, planks, &c. which make bridges over small rivers; and on divers other occasions.

**Horse,** in Mining, is one of the very numerous designations which have been given by practical men to the fissures and dislocations of the strata met with in coal-pits and other mines. See Fault.

**Horse,** in Rural Economy, is the name of a sort of wooden frame strongly put together, for the purpose of sawing and cutting wood upon.

**Horse,** in Sea Language, is the name of a rope reaching from the middle of a yard to its extremity, or what is called the yard-arm, and depending about two or three feet under the yard, for the sailors to tread upon, whilst they are looking, reeling, or furling the sails, rigging out the fudding-fall-booms, &c. In order, therefore, to keep the horse more parallel to the yard, it is usually suspended to it, at proper distances by certain ropes called flirumps, which hang about two feet under the yard, having an eye in their lower ends through which the horse passes.

**Horse** is also a thick rope extended in a perpendicular direction near the fore or after-side of a mast, for the purpose of hoisting or extending some sail upon it. When it is fixed before a mast, it is calculated for the use of a sail called the square-fall, whole yard being attached to the horse, by means of a traveller, or bell's eye, which slides up and down occasionally, is retained in a steady position; either when the sail is fast, or whilst it is hoisting or lowering. When the horse is placed abait or behind a mast, it is intended for the try-fall of a sail, and accordingly very rarely fixed in this position, except in those ships of war which occasionally alme the form of snows, in order to deceive the enemy. Falconer's Mar. Dict.

**Horse** is also a cant name introduced into the management of lotteries, for the chance or benefit of a ticket, or number, for one or more days, upon condition, if it be drawn a prize within the time covenanted for, of returning to the seller an undrawn ticket.

**To determine the value of a horse.**—Multiply the amount of the prizes in the lottery by the time the horse is hired for; and from the product subtract the amount of the number of prizes by the value of an undrawn ticket into the time of the horse; the remainder being divided by the number of tickets 

$$ \frac{C \times 2}{2} $$
into the whole time of drawing, the quotient is the value of
the horse. See Lottery

Horse-back, in Mining, is applied to the humps or swell-
ings on the top of some particular floras, which are subject
to such anomalies, and which are also called bumps, ridges
&c.

Horse Bean, in Gardening. See Bean.

Horse Beet. See Cariam.

Horse Bows, Fossils, in Natural History. In digging in
the peat and silt of fens and marshes, it is not very uncommon
to meet with the skulls and bones of horses, as in Hatfield
chase, in Yorkshire, and the Isle of Dogs, in Middlesex.
(Parkinson's Organic Remains, vol. i. p. 67 and 65.) The
great comparative anatomist, M. Cuvier, in a Memoir on this
Subject, in the Ann. de Muscum, tome xiv. page 33, or Phi-
losophical Magazine, vol. xxxv. p. 216, after mentioning a
great number of instances and specimens preferred, of the
bones of horses which had been dug up, both in modern al-
levial flats, and also in quarries accompanied by the bones
of unknown and extinct animals, gives the oölological char-
acters of the horse, and confesses that though they may serve
to distinguish the modern or peat fossils, they are insufficient
for determining, in certain instances which occur, to what species,
whether to any of the known species of the genus equus, the
fossil remains in the floras are to be referred. (See Phil.
Mag. vol. xxxv. p. 388.) The pretended bones of a horse
found in the alum-works of Saltwick, and mentioned by
Mr. Charlton in his 'History of Whitby,' p. 355, were
probably those of an extinct animal.

Horse bramble, in Agriculture, a common name often ap-
plied to the brier or wild rose of the field.

Horse-bread. Bread of a proper kind is often given to
horses to hearten and strengthen them when they have gone
through great fatigues, or are to prepare for such. Common
houfhold-bread will answer the purpose, but the more com-
mon way is to prepare a kind of bread on purpose. There
are two different receipts for making this sort of bread, each
of which has its admirers. The first method is this: take
wheat-meal, oat-meal, and beans ground fine, of each half
a peck; anifeed, two ounces; gentian and fenugreek-
feed, of each an ounce; liquories, two ounces; let all these
be made into a fine powder, and sifted together, that they
may be perfectly mixed; then add the whites of twenty
new-laid eggs, and as much fine ale as will knead the
whole into dough. This is to be made into loaves, and
well baked, but not burnt; and the horse is to have a
good quantity of it every morning for five or six days,
without any other provender.

The other method is much nicer, but perhaps does not
any way better answer the intended purpose of heartening
up the creature. It is this: take wheat-meal, rye-
meal, bean-meal, and oat-meal, of each half a peck; anifeed
and liquorice, of each an ounce; white sugar-candy,
four ounces: beat all these into powder, and sift them togeth-
er; then add the whites and yolks of twenty new-laid eggs,
and as much white wine as will make the whole into a
dough. Let this be made into great loaves, and well
baked; it must not be given the horse too new, but when
it has stood about three days it may begin to be used; the
outside is always to be chipped off when any of it is given.
These are the two sorts of bread usually given to prepare
horses for long journeys. But there are three other receipts
for making bread for race-horses, which are as much esteemed,
and are given by our expert jockeys for the second, third,
and fourth fortnight's feed. The first kind is made in this
manner: take three pecks of clean beans, and one peck of
fine wheat; let these be ground together, and kneaded into
dough, with a large quantity of fresh barm or yeast, but with
as little water as may be: when this has heaved and worked
up a little, let it be kneaded again, and then made into large
loaves and carefully baked; when three days old it may be
given to the horse, but not sooner.

The second kind is to be made as the other, only with
equal quantities of beans and wheat, and the crust of this
kind is to be cut quite away before it is eat. This is to be
given to the horse at his usual meals, either alone, or mixed
with oats and split beans.

The third sort of bread is stronger than either of the
others, and is to be made thus: take three pecks of wheat,
and one of beans; let them be ground together, and made
into very fine flour; knead this up into dough with a
good quantity of yeast dissolved in as much strong ale as
is necessary; add the whites of twenty eggs, and make
the whole into large loaves. These must be thoroughly
baked, and when they have stood three days, the crust
must be cut off, and the crumbs only given, either alone,
or mixed with oats or split beans. This is to be the food
for the hill fortnight.

Horse Chestnut, in Gardening. See Aesculus and Chas-
ney Tree.

Horse Chestnut, Petrified, in Natural History. In that
fruitful soil for vegetable remembrances, the pyritic cliffs of
the upper part of the London clay in Shewpy illand, in the
Thames, Mr. Jacob mentions a nut resembling the horse-
chestnut of America: the reality of its being a nut of any
kind is much to be questioned, from the circumstances at-
tending it.

Horse Courè. See Hippodrome.

Horse dung, in Agriculture and Gardening, the name of
that fort which is produced by the horse in the stable or
other place. As it exils in these situations it is generally
much blended and intermixed with different sorts of strawy
materials, which, from their corroding the dung to take on
heat more readily, render it of great utility in different
views of field and garden culture. It is this property of
running speedily into the state of fermentation that makes it
so useful in the forming of hot-beds in the gardens,
in order to raise several different early productions of the
culinary kind, as well as many tender plants of other
descriptions.

That which is the most proper for this use, in general,
is such as has continued together in the common dung-
hill until a considerable heap has been formed; and where
it has already commenced the incipient stage of fermenta-
tion, and is become either wholly or partially moit warm,
and capable of sending forth some degree of heat, it is still
more suitable for the purpose. When, on turning it up
with the fork, it puts on a sort of blackish appearance, and
is dry without being rotten or exhausted, and abounds
with a fresh sublitial material that has a lively, moit,
leamy warmth, it is in the most proper condition for the
construction of hot-beds. But dung that is of a fresher
quality, yet moist and full of leamy litter, is highly de-
firable, as it is readily capable of being brought into the
proper state. With this raw fort, the best plan is to have
it thrown up and well mixed together, before it is em-
ployed in constituting the hot-beds.

Where it is intended to be used merely as manure, wheth-
er in the field, or the garden, it is the most proper
for almost every kind of crop, when it has passed into a
considerably more reduced state, and is become more soft
and more imbued with moisture. On this account, it is
found extremely useful in raising various sorts of culi-
nary vegetables in the open ground, after it has been em-
ployed
HOR

ployed in the forcing-frames, or other hot-bed culture. It is essential, in all large gardens, to have full supplies of this sort of materials always at hand during the seasons at which it is likely to be wanted. See DUNG, HOT-bed, and MANURE.

Horse-engine, in Mining, is applied to the gins which are used at some of the lead-mines, similar to those of the coal-mines for drawing their ore and vein-fluff, and their water also, in barrels, in some few instances. See Winding Engine.

Horse-fly, in Entomology. See HIPPOPOTAMUS Equinus.

Horse-gin is a vertical axle and large cylinder or drum, turned by horses, for drawing coals or ores from pits or mines, &c. See Winding Engine.

Horse-gold, in Mining, is in some districts used to denote the hematites, or yellow pyrites.

Horse-hair, animated, a term used to express a fort of long and slender water-worm, of a blackish colour, and so much resembling a horfe-hair, that it is generally, by the vulgar, supposed to be the hair fallen from a horse’s mane into the water as he drinks, and there animated by some strange power. Dr. Lister has at large confuted this absurd opinion, in the Philosophical Transactions. See AMPHIBIENS aquatica.

Horse-hair-worms. See AMPHIBIENS.

Horse-head, in Botany. See Star wort.

Horse-hoof, in Rural Economy, a name given to that fort of hoe, which is drawn by the labour of the horse. See HOE.

Horse-hoeing, a term signifying the operation of stirring, breaking down, and cultivating the soil, between the rows of grain, and other kinds of crops, by the use of the horse-hoe. See HORSE.

Horse-hoof, in Geography, a small island of Scotland, in the Frith of Clyde, near the coast of Ayrshire. N lat. 55° 41'. W. long. 4° 52'.

Horse-islands, a cluster of small islands near the E. coast of Newfoundland. N lat. 50° 25'. W. long. 55° 30'.

Horse-keeper, in Agriculture, a name applied to the person, or servant, who has the charge of keeping, and looking after, team or other horses. It is necessary he should be well qualified for his business, as without a steady regular horse-keeper, the farmer may suffer great injury and loss in various ways; while, with a proper manager, his savings may be considerable, without the condition of the animals being in the least impaired. It forms part of the constant attention of the horse-keeper to see that the horses of which he has the charge, are properly cleaned, watered, and fed as soon as they return from their labour, and that their feet be well cleared beneath the foot, by the picker, from all sorts of little stones and earthy matters. The shoes should likewise be carefully examined, to see that they are perfectly fast and in order. Good shoes usually last something more than a month. It is also proper for this person to take care that they have plenty of litter, and that it be properly applied, as well as that their feeds of oats and cut meal be given to them in a regular manner, and in sufficient quantities. The usual periods of feeding with grain are morning, noon, and night, and the proportion for each horse, each time, from a quarter to half a peck, with frequently about two handfuls of beans, and sometimes cut chaff. The oats should be well sifted, to clear them from dust, sand, &c. It is necessary, in addition, to let them have water twice, or oftener in the course of the day. See TAI.

Another part of the duty of the horse-keeper is that of taking care of, and keeping the harness, &c. in proper order. This is done by preserving them constantly clean and well oiled. When not in use, they should always be hung up carefully in their proper rack, or place after having the dirt, &c. well cleaned from them.

Horse-knobs, a common name frequently applied to knob or knap weed.

Horse-leech, in Zoology. See Hirudo sanguinosa.

Horse-line, in Nautical Affairs, signifies the long line or rope used for towing or dragging of barges or boats on navigable rivers and canals; it is usually fastened to the top of the mast on wide rivers, and to the top of a short mast in canal-boats, called the chock, which can pass under the bridges, and from which the line can readily be unhooked or cut off by the boat man, to pass bridges which have no towing path under them. See CANAL.

Horse-load, is a denomination of a measure or quantity in several different counties, chiefly of corn or lime. At Lancaster the load of barley is 6 bushels, of oats 7½ bushels, and of wheat, beans, or peas 4½ bushels; at Manchester the load of beans is 5 bushels, and of oats 9 bushels; at Ulverstone a load of oats is 6 bushels, and of wheat 4½. In most parts of Derbyshire a load of corn is 8 bushels; in many places the load or weight is five bushels. A load of lime in Derbyshire is 3 heaped bushels.

Horse-mackarel, in Ichthyology. See Scophius charrus, or SCAD.

Horse-measure, that fort of measure which is employed to ascertain the heights of horses, which is done by a fort of box rod, so contrived as to slide out of a cane, having a square at the end, which is divided into hands and inches, by which a horse, or any other animal, may be measured.

Horse-mint. See Mint.

Horse-mules, See MULE.

Horse-muffle Shells, in Natural History. The late Mr. Whitehurst, in describing the brata of Derbyshire, Inquiry concerning the Earth, p. 228. 2d edit., mentions the shells of fresh water horse mufcles, as found in abundance in a thin stratum of iron-clone. Mr. William Martin, in his Petriflaca Derbienia, plate 27, figures and describes this shell, and denominates it the mya ovata of Dr. Maton; it has been said, however, by competent judges, that the above authors were influenced too much by their theory of the coal-measures being formed in fresh water, and that the resemblance is not exact between the shells of the muscle-band iron-clone, or iron-clone marble, (the course of which, through Derbyshire and into Yorkshire, is described in Mr. Farey’s Report, vol. 1.) and any recent or known shells whatever.

Horse-path, in Engineering, is sometimes applied to the towing-path which is obstructed by the side of all canals, and by narrow navigable rivers, for the use of the towing or truck horses. See Hauling way.

Horse-power, in Mechanics. Among practical mechanics it has been usual, of late years, to estimate the power of large machines and engines by the number of horses to whose work they are equivalent, applied to a horse-wheel, during a given time. This term was introduced when steam-engines first began to supersede horfe-mills, in such numerous branches of English manufactures, and when it was natural for the manufacturer to enquire how many horses a steam engine would displace with in his works, and at what first cost of erection, and per annum in coal, attendance, and repairs afterwards. Melfis, Bolton and Watt’s present estimate of this power is, as we are informed, 33,000cb. raised one foot per minute; the late Mr. Francis Thompson of Ashover, Derbyshire, who erected a great many engines, used to estimate it at 33,000cb. Defagulier’s experiments, when thus reduced, give 22,000cbb.; and another experi-
HOR

Horse-tails, in Gardening. See CECILIAE.

Horse-riders, in Agriculture, a name applied to a large fort of rakes which is usually drawn by a horse, and frequently in use in the more southern parts of the kingdom. It answers well for hubbles, and large horse-riders for hay are now likewise found very beneficial. See RAKE.

Horse-riber, or Rio de Cavales, in Geography, a river of Mexico, which runs into the bay of Honduras, N. lat. 15° 48'. W. long. 86° 45'.

Horse-run, in Engineering, is a simple and useful modern contrivance, for drawing upon loaded wheel-barrows of foil from the deep-cuttings of canals, docks, &c. by the help of a horse which goes backwards and forwards, instead of round, as in a horse-gin, which we have fully described in our article CANAL.

Horse Stealing, the taking of horses from the pasture grounds or other places, by persons who have no claim or right to them whatever.

It is a practice which is very prevalent, notwithstanding the very heavy punishments and severe penalties that are inflicted in caues of detection. There is much difficulty in providing any full and adequate remedy for this nefarious practice; it has, however, been suggested as the best mode of security to lock "upon the flank or pattern of the horse, a cafe hardened, and file proof iron ring, lined with some soft material to prevent chaffing, and bearing the owner's name and place of abode," though "some have preferred the fixing a collar upon the neck," but "which is rather more expensive, and perhaps less secure from the thief," yet "in every cafe the price would not be any great object. It is granted, there would be no absolute security in this plan, since thieves get their bread by their inconstancy; but it would certainly place a very great and formidable difficulty in the way of the exercit of their calling. There are few thieves, but who, on inspection, would prefer a horse without this troublesome mark upon him.

Granting a man did his buffneys at random, and blundered upon a horse in the dark bearing the foresaid mark, as soon as the light should enable him to discover it, he would, no doubt, run away from his new and dangerous bargegin as fast as he would from a thief-taker. Suppose even a man went prepared with tools proper to destroy the iron, he must have an affiant, and the operation would require some time, which would risk a discovery. In cases of fhray the security is complete. But in all caues, it seems the pretit troth is sus especiated to outweigh the eventual benefit of precaution."

But this is left to the attentive calculation of such as are interested in the matter. Where the horses are of the more valuable kinds, no methods of precaution which have any chance of being useful should be neglected.

Horse-tail, Shrubbs, in Gardening. See EPIMEDIA.

Horse-tail plant, Petrod, in Natural History. In that fruitful repository of extraneous foolish, the cliffs of the upper part of the London clay strata in Sheppy island, in the Thames river, the strata of which seem to answer to those jult now exposed by the tunnel and deep-cutting for the new road on the east side of Highgate town, Mr. Jacobs describes (Plante Faverhamianes, p. 138.) joints of the equiferum or horse-tail plant, as sometimes found, of the naked species, three inches long. Dr. Grew, in his catalogue of "Rarities" of Tunbridge College, p. 468, mentions a horsetail plant or plantain, a flower with the impressed figure of three flacks, elegantly rising up from one root, preserved in that collection.

Horses-tree, a common name signifying the same thing as whippin, whipple, or flyingle tree, when applied to the draught of tools of different kinds.

Horses, a common name signifying the same thing as whippin, whipple, or flyingle tree, when applied to the draught of tools of different kinds.

Horses, anum, an instrument of military punishment, formerly much in use in different services. The wooden horse was formed of planks nailed together, so as to form a sharp ridge or angle about eight or nine feet long, which ridge represented the back of a horse. It was supported by four poles or legs, about six or seven feet long, placed on a band made moveable by trucks; and in order to complete the resemblance, a head and tail were added. When a soldier or soldiers were sentenced by a court-martial, or ordered by the commanding officer of the corps to ride this horse, they were placed on the back with their hands tied behind them, and frequently, as an increase of the punishment, had masts tied to their legs, to prevent, as it was heuriously said, their horses from kicking them off; this punishment being chiefly inflicted on the infantry, who were supposed to be unable to ride. At length, riding the wooden horse having been found to injure the men materially, and sometimes to rupture them, it was left off.

Horse Worn, in Natural History, a species of fly-worm called also bert, produced of eggs deposited by a two-winged fly, of the shape and size of the humble-bee, in the infields of horses. See BOTT.

Horses, in Engineering, is applied in some marine districts to the jetties or erections of wood or falfery, made to protect the sea walls from the waves.

Horse-Block, See ANIONTHIR.

Horse-Block. See Anionthira.

Horse-Man, the name given to a particular species of pigeon, called by Moore the colubra tobeleria minor. It very much resembles in shape the carrier-pigeon, but it is smaller, and shorter necked; the protuberant flesh on the head, and round the eye, is also less in quantity; it is more barred-head and also, the eye is somewhat pinched. It is a matter of dispute whether this be an original species of pigeon, or a bastard between the carrier and tumbler pigeons.

There are of this species of all sorts of feathers, but the blue and blue-pieds are the most valued. These are one of the sort of pigeons made use of in England for carrying letters, and flying for wages; for the true original carriers are now very scarce, and not ridden on every trilling occasion.

HORSEMANCESHIP, the art of breaking, disciplining, and managing horses.

Horsmanship, in a general, includes what relates to the knowledge of the make, colour, age, temper, and qualities, of horses; their respective countries and climates, with the manner of breeding, propagating, &c. the discovery of the uses or service they are fitted for; whether the wars, the race, the saddle, labour; and forwarding and accommodating them for this purpose.

In this general fence it also includes the knowledge of the defects and diseases of horses, and the remedies proper for the fame, with the several operations requisite thereto, as docking, gelding, fleecing, &c. and thus takes in the farther's province.

But the word is in a more peculiar manner understood of the art of riding, or of directing a horse to advantage; not only in the ordinary motions, but more especially in the managing, or making him work upon volites, airs, &c. See MANIGE.

HORSHAM,
HORSHAM, in Geography, a market and borough town in the rape of Bramber, and county of Sussex, England, is traditionally said to derive its name from Horsham, a Saxon chief-town, who is supposed to have had either a place of residence here, or to have achieved some victory in this part of the country. There is no record preferred, however, of either event, and the origin of the place may be as rationally referred to some other person or circumstance. In the county of Norfolk is another parish of the same name, which has equal claims to the same etymology. Of the present Horsham, we do not find any early records; though it is stated to have returned two members to parliament in the reign of king Edward I. This privilege it still retains, as a prescriptive borough. Its civil government is vested in a rector, two bailiffs, and two constables; whilst its election franchise is confined to 25 burgage holders, i.e. persons occupying, or possessing burgage houses, or lands within the borough. There are now wholly the property of the duke of Norfolk; who, consequently, has the unrestrained power of nominating and appointing the members. The county gaol, for Sussex, stands near the south-eastern extremity of this town. It is a large convenient edifice, and is built conformably to the plan recommended by Howard. From ancient custom, the alms for the county of Sussex are alternately held here, and at Lewes; at this place, the petty seances are also held. The church, a large irregular building, contains two old tombs, besides mural tablets of modern date. In the town are four other places of worship, belonging to different sects of dissenters. Here is a free-school, which was originally endowed with 20l. a year for a master, and 20l. for an usher. In 1821 the town contained 573 houses, and 3522 inhabitants. Here is a weekly market on Saturdays, which is noted for its poultry; and the last Tuesday of every month is appropriated for a cattle market. Here are four annual fairs. Horsham is 41 miles S. of London, and 20 miles N.W. of Brighton.

In the vicinity of the town are the following seats: Hills, lately belonging to lady Irving. Field Place, the seat of Timothy Shelley, esq. New Lodge, the seat of J. Aldridge, esq. Coolhurst, Edward Carter, esq. Den Park.

Horsham, a township of America, in Montgomery county, Pennsylvania, containing 781 inhabitants.

Horsham Stone is a kind of thin hard flint, of a greyish colour; formerly much used, especially in Sussex, to heal or cover furrows and channels, great houses, &c. but on account of its weight too onerous for the purpose.

It is called Horsham stone, because chiefly brought from the town of Horsham in Sussex.

HORSEHEAD, in Mining, is a large hopper of wood, the small end of which is close jointed to the air-pipes, or fangs, which are used in the lead mines of Derbyshire subject to foul air: the horsehead being turned towards the wind from time to time, a current of air is by that means directed down the fangs into the mine.

Horsehead Cockle, or Hippocarphoides, in Natural History, deprested on one side and having the future or joint in the middle of the deprested part, is found in the limestone strata of Buckinghamshire. Jones's Phys. Dsp. p. 424. Sometimes these are called horsehead muscles by the quarrymen and others.

Horsehead Flints, in Geology, is a name pretty generally known in the chalk districts of England, and adopted by Mr. Smith and his pupils, for the large and irregular black flints with white surfaces, resembling in size, and somewhat in outward shape, the heads or skulls of horses, which being curiously locked into each other, almost like the futures of a skull, form a stratum of flints of fix to ten inches thick on the very top of the chalk series, and of which these horsehead flints are very characteristic. These flints are very commonly found in the alluvial clays of Woburn, in Bedfordshire, and other places till more distant from the chalk; and what among other circumstances prove these clays, &c. to have been moved in mafs and not rolled along the surface by water, is, that the horsehead flints, though exceedingly brittle, often have large holes through them near their edges, so as to form handles to them, which are entire and unworn, though a slight blow would detach them as the handle of an earthen pitcher or mug; by means of these holes they are very often suspended as jack-weights, and for other similar purposes, in the districts where they are found.

HORSELEY, John, in Biography, a learned antiquarian, was a native of Northumberland, and was educated at the grammar school of Newcastle-upon-Tyne; he studied for some time at one of the northern universities, where he took a degree, and then settled at Morpeth as tutor to a congregation of Dissenters. He died in December 1751, at the age of 56. His great work did not appear till 1732, some time after his death. It is entitled "Britain Depopulata," and contains a large account of all the vestiges of the connexion of the Romans with this island. It consists (1) of an historical relation of all the Roman transactions in Britain; (2) of a collection of all the Roman inscriptions which have been discovered in Britain; (3) of the geography of the island, laid down by Ptolemy, &c. Mr. Horsey was a considerable mathematician, and gave lectures in several branches of natural philosophy, both at Newcastle and Morpeth. Gen. Biog.

HORSENS, in Geography, a sea-port town of Denmark, situated on the Baltic, in Jutland, in the diocese of Aarhus; having a harbour with the water too shallow for admitting any vessels besides lighters. It is a place of considerable trade, with manufactures of flannel and other woollen stuffs, and contains two churches; 19 miles S.S.W. of Aarhus. N. lat. 55° 52'. E. long. 9° 52'.

HORSE-SHOE, in Fortification, is a work sometimes of a round, sometimes of an oval figure, inlaid with a parapet, raised in the ditch of a marshy place, or in low grounds; sometimes also to cover a gap; or to serve as a lodge for falloirs, to prevent surprizes, or relieve an over-timidous defence.

Horse-shoe Head, a difcafe in infants, wherein the futures of the skull are too open, or too great a vacuity is left between them; so that the aperture shall not be totally closed up, or the cranium in that part not be so hard as the rest for some years after.

This opening is found to be increased upon the child's catching cold. When the difcase continues long, it is reputed a fign of weaknefs and short life. In this cafe, it is ufar to rub the head now and then with warm rum, or brandy, mixed with the white of an egg, and palm-oil. Sometimes the diforder arises from a collection of waters in the head, called an hydrocephalus.

Horse-shoe, in Mining, is used by Mr. Kirwan (Geol. Eft. p. 337.), to express a depreflion of strata in a trough-like manner, probably, as the vale of the gayte between Derbyshire and Cheshire presents a striking imitation of, according to Mr. Farey's Report, vol. i. p. 172; in this cafe the edges of the strata prefer the form of a lengthened horse-shoe dipping inwards; but a more remarkable and larger cafe of a horse-shoe, of the edges of strata, dipping outwards, is there described as preferred by the edges of the first or millstone.
HORSESHOE, in Rural Economy, the well-known iron cover or defence which is fastened by means of nails upon the foot of the horse. It requires much care and attention to fix horses in a safe and proper manner. See SHOEING of Horses.

HORSESHOE POINT, in Geography, the most fotherly point of land, near the E. end of the illand of St. Christopher.

N. lat. 17° 19'. W. long. 63° 32'.

HORSESHOE VETCH, in Botany. See VETCH.

HORSING-BLOCK, in Surgery, is a square frame of strong boards used by canal diggers, to elevate the ends of their wheeling-planks upon. See Plate VII. of CANALS, fig. 40.

HORSLEY, Samuel, in Biographies, eldest of the three sons of the Rev. Mr. Horley, formerly minister of St. Martin's in the Fields, was born about the year 1737. He was educated at Westminster school, whence he was removed to the university of Cambridge. Here he applied himself chiefly to the study of the mathematics, and not content with reading modern authors, he went back to the profoundest of the ancients, and made himself master of their works. When he had taken his degree of M. A. he went to Oxford as private tutor to the earl of Aylesford. He received at this university the degree of doctor of laws, and in 1750 he printed at the Clarendon press his edition of Apollonius, a work of great value, but exceedingly abstruse. Here he conceived the design of publishing a complete edition of the works of Sir Isaac Newton, for which he began to collect the necessaiy materials. On leaving the university, Dr. Horley came to London, where he was elected a fellow of the Royal Society, of which he was chosen secretary in 1773. He continued to serve that office with the greatest credit to himself, as well as benefit to the interests of science, till the resignation of the then president, Sir John Pringle. Soon after his settling in London, he accepted of the office of chaplain to bishop Lowth, who presented him to the rectories of St. Mary Newington and Albury, both in the county of Surry, and in the course of the year he married Miss Botham. In 1776 he published proposals for his edition of Newton, which appeared in 1779 in five volumes, royal quarto. To this edition he prefixed a dedication to the king, written by the doctor in excellent Latin, which concludes with these words, "Te, Pater, tan tum DoCoRinarum Artiumque Nominum Patronum, t. nobis供热, tuerat, cuiodatum. Tibi vero gratum precor sit Minus, quod reverentia et officio caufa Tibi dicit, qui in subditorum Tuorum fideliHinorum numero nomen fuum prorifer gefit, unus idem ex humiliHin." In 1778, when the controversy was on foot between Drs. Priestley, Price, and others, respecting materialism and philosophical necessity, Dr. Horley preached a sermon on Good Friday at St. Paul's cathedral, which he afterwards published. In this discoufe he endeavours to reconcile the doctrine of divine providence with the free agency of man, and combat the necessarian hypothesis with much ability. About this period he was appointed archdeacon of St. Alban's by his patron bishop Lowth, who, in 1782, prefigured him to the valuable living of South Wilford, in Eltou. From this time he entered anewly and zealously into the controversy of the Unitarian doctrine with Dr. Priestley; the latter maintaining the simple humanity of Christ, in opposition to the creed of the established church, which admits of three Gods in every respect equal. The controversy was carried on with some bitterness, till at length the archdeacon signified his intention to proceed no further, saying, that it was an endless talk to contend upon an exhausted topic with one who was never disposed to cease disputing without having the last word. In 1789, Dr. Horley collected the tracts which he had written on the occasion, and printed them in one volume octavo, with additions, particularly a fervent refutation of the Unitarian doctrine, which had a material relation to the controversy in question. He had, in the year 1758, been raised to the bishopric of St. David's by the interest of lord Thurlow, who paid, that those, who defended the church and its doctrines were justly entitled to the honours and emoluments it had to confer. In the year 1790, when the Protestant Difenters were calling for relief from the tell and corporation acts, the bishop published a pamphlet without his name, entitled "A Review of the Cafe of the Protestant Difenters." This piece excited much attention, its style was nervous, but it was accused of illiberality and unfairness in the argument. It was a justification of high church principles, and brought forth a number of answers from perfons in and out of the church. In the year 1794, bishop Horley was translated to the see of Rochester, which he held with the deanship of Welfminster. In 1795 he gave the public a very learned dissertation on "The Latin and Greek Pro- fodies," which he dedicated to lord Thurlow; and in the year 1803 appeared his fourth quoft Critical Difficulties on the Eighteenth Chapter of Ifaiah, in a letter to lord King. Two years after this he published a new translation of the prophet Hafea, with notes critical and explanatory. He was in the same year translated to the rich see of St. Afaph; after this, the principal work that came from his lordship's pen was a critical essay on "Virgil's two Seasons of Honey, and his Season of Sowing Wheat; with a New and Com- pendious Method of Investigating the Rulings and Settings of the fixed Stars." Dr. Horley died at Brighton on the 4th of October, 1806. No man of the age, perhaps, prof- fefled more of what is generally understood by the idea of recondite learning. As a senator he was confidered in the first clafs: there were few important discussions in the house of peers, especially when the topics referred to the hierar- chical establishments of the country, to the French revolu- tion, or to the flave trade, of which he was a systematic and eloquent opponent, in which his lordship did not participate. As an orator, his voice was deep, full-toned, and commanding, his enunciation distinct, and his delivery highly advantageous. As an author, besides the works already referred to, he published many smaller pieces, and also three volumes entitled "Elementary Treatises on the Funda- mental Principles of Practical Mathematics for the Use of Students." As a bishop, an overfeer of his diocefe, his con- duct was exemplary and very praiseworthy. In the see of St. David's, which was faid to exhibit more of ignorance and poverty than that of any other in the kingdom, he car- ried through a regular fytem of reform. He regulated the condition of the clergy, and proceeded to a firrer course with respect to the candidates for holy orders, admitting none without personally examining them himself, and looking very narrowly into the titles which they produced. With all this vigilance, his lordship acted to them as a tender father, encouraging them to visit him during his day in the country, which was ufually for several months in the year, affaffing them with advice, and miniftering to their temporal nece- sities with a liberal hand. In his progress through the dio- cefe, he frequently presided in the parish churches, and befowed considerabie largesses on the poor. "He was," says his biographer, "a bleffing to his people, and they followed him with grateful hearts, and parted from him with infinite reluctance." Since the death of the bishop, two volumes of his sermons have been given to the world by his son,
fun, who proposes, “if it please God to spare him a few years,” to publish an uniform edition of all his father’s works, with a biographical account of the author. The bishop has left behind him in MS., but ready for the press, a Translation of the Book of Psalms, with Notes; a Treatise on the Pentateuch, and on the Historical Books of the Old Testament; a Treatise on the Prophets; containing Notes on Isaiah, Jeremiah, Ezekiel, Joel, Amos, and Obadiah; which will be published, if the demand for them be such as to justify the undertaking. Monthly Magazines, vol. xxxII. Preface to Sermons, by Samuel Horsley, L.L.D. F.R.S. F.A.S. late lord bishop of St. Afaph.

HORST, in Geography, a town of Westphalia, in the bispohric of Paderborn; 6 miles W.S.W. of Paderborn.—Alfo, a town of Germany, in the county of Marks; fix miles N.N.W. of Hattingen.—Alfo, a town of the duchy of Hol contents; four miles E. of Krempe.

HORSTIUS, James, in Biography, a physician and ho- tanist, was born at Torgau, in May 1537, and took the degree of M.D. at Frankfort on the Oder in 1562. After having practised his profession for several years, he was appointed ordinary physician of the archduke of Austria in 1583; a post which he occupied about four years, and then was elected to a chair in the university of Helmstadt, in which he pronounced an inaugural oration, “De remissor directionum medicam et eorum cauſa.” He is said to have been dean of the faculty and vice-rector of that university in 1595, and to have died in 1600; but others believe that his death occurred earlier. His works are as follows: “Precationes Medicorum Pie,” Helmstadt, 1585, 12mo. “De vitae vinnæa ejusque partibus opusculum,” ibid., 1587, 8vo. Marburg, 1630, with the following: “Herbarium Horizonum, feu, de felecibus plantis et radicibus libri duo,” Helmßt. 1587. “De natura, differentiis, et causis eorum qui dormientes ambulant,” Lipphiæ, 1593, 8vo. “De auro ete dente maxillari pueri Sileari,” Lipsiæ, 1595. “Epitome Philosophiae et Medicinae,” ibid. 1596. “Dissertationes Catholicae de rebus acirdum et preter naturam,” Witttenberg, 1609. Eloy. Dict. Hist.

HORSTIUS, Gregorie, an able and learned physician, nephew of the preceding, was born at Torgau, where his father was one of the chief magistrates, in the year 1575. After having received the rudiments of his education in the schools of Torgau and Halberstadt, in which he far outstripped his equals in age, he went to the university of Witt tenberg, and commenced the study of medicine; and afterwards travelled through the principal states of Germany, and into Switzerland, being introduced not only in the schools of science, but to men of literature in general. At Basf he received the degree of M.D. in March 1605; and on his return, in the same year, to his native place, he was immediately appointed to a medical professorship, in the university of Wittenberg, by the elector of Saxony. Two years afterwards he was promoted by the Landgrave of Hesse to a medical chair in the college at Giessen, and in 1609 was honoured with the title of Architect of Hesse. At this time his professional character had riven in the public estimation, and he numbered among his patients the principal nobility of the diſtrict. In 1622, he received a public invitation from the magnificy of Ulm to settle there as physician to that city, and as president of the college. He fulfilled his duties in both these offices with great reputation; and his integrity and humanity, not less than his extensive erudition, and his successful practice, endeared him to his fellow-citizens, and claimed the respect and admiration of the surrounding states. He died in the month of August 1636, aged 58 years. During his residence at Giessen and at Ulm he employed his leisure in active study, and he left a considerable number of works, of which it will be sufficient to enumerate the titles of the principal. The whole of his works were collected and published, under the title of “Opera Medica,” in 1600, 3 vols. folio, at Nuremberg, by his youngest son, Gregory. Among his separate publications are “De Natura Humana Libri duo,” Wittenberg, 1610. “De Tractatus de Scurboto, fve, de magnis Hippocratis Libri, Quinque Tomi, et Scelotyrbe,” Giessen, 1609, 1615. “Centuria problematica Medicorum,” 1610. “De morbis eorumque causis Libri quattuor,” with a supplement, in 1631; and an abridgment of his uncle’s “Herbarium Horizonum,” 1630; and some smaller tracts, entitled “De natura amoris? De natura motus animalis et voluntari;” “De causis similitudinis et diffimilitudinis in fato respectu parentum,” &c. See Gr. Horſti Oratio funebris a J. D. Dietrich, subjoined to his works. Eloy. Dict. Hist.

HORSTIUS, John-Daniel, and Gregory, two sons of the preceding, were also physicians and professors of medicine; the latter of whom died at the age of 35; but John-Daniel lived to his 65th year, and was the author of several works, chiefly anatomical, and of little value at present. He was concerned with his brother Gregory in editing the collection of his father’s works; and likewise published an edition of the “Punctuation Medicina-legales” of Paul Zachius, Frankfort, 1666, in folio; and an edition of the “Opera Medica” of Riverius, at the same place, in 1674, in folio. Eloy.

HORSTEMAR, in Geography, a town of Germany, in the bispohric of Munster; 15 miles N.W. of Munster. N. lat. 52° 30’. E. long. 7° 17’.

HORSZCZYK, a town of Poland, in the palatinate of Volhynia; 48 miles N. of Zytomiers.

HORTA, in Mythology, a goddes among the Romans, who presided over youth and excited them to virtue by her exhortations. Her temple is never shut, to admonish youth, so liable to be seduced, “erex in vitrum flætis, that they should be always disposed with particular vigilance over themselves to the practice of virtue.

HORTAGILERS, in the grand seignior’s court, are upholurers, or tapestry-hangers.

There is no city better or more orderly regulated than the grand seignior’s camp; and to have a notion of the magnificence of that prince, he must be seen in that equipage; as he is much better lodged and accommodated there than at Constanținople, or any other city of his dominions.

He has always two tents or pavilions, and two sets of furniture entire; that, while he is in one, they may pitch or spread the other.

In order to this, he has constantly 400 hortigators, or upholters in his retinue, who go a day’s journey before him to fix on a proper place. They first prepare the Sultan’s tent, and then those of the officers of the Porte; and the hortagers, according to their rank.

HORTATOR, in the Roman Navigation, an officer whose business it was to give the word of command to the rowers, and to direct them when to stop, and when to ply their oars.

The Greeks gave the name of ceulescuses to this officer.

HORTE, John, in Biography, a learned prelate, who was educated for a disenting minister under Mr. Thomas Rowe, and had for a fellow-pupil the celebrated Dr. Isaac Watts.
Watts, with whom he kept up a correspondence till the doctor's death. He was settled in early life as a dissenting minister at Marshfield in Gloucestershire; while there, he conformed to the church, and in 1768 preached a visitation sermon at Aylebury. He was afterwards taken to Ireland as chaplain to the Lord Lieutenant, where he was made bishop of Loughlin and Ferns, from whence he was translated to Kilmarnock, and in 1742 to the archbishopric of Tuam. He died in 1751. His works are a volume of excellent sermons, printed at Dublin in 1738, and afterwards at London in 1737. Month. Mag.

HORTENSUS, QUINTUS, a distinguishing Roman orator, born about the year 115 B.C. He began to plead before he was nineteen years of age, and with so much talent, that the great Cicero said of him, "the genius of Hortensius, like the statue of Phidias, was at once beheld and approved." He afterwards entered the army and rose to the post of military tribune: he then passed through the usual course of civil offices to the consulship, which he served with Caecilius Metellus B.C. 70. At that period he had acquired so much power and distinction by his eloquence, that when the lot of the Cretan war fell upon him, he resigned it to his colleague, preferring the distinction and celebrity of the forum and senate-house. He continued to plead till his death, which happened in his sixty-fourth year, or 51 B.C. We refer to the article CATO for a curious incident in the domestic life of Hortensius. As an orator he was elegantly splendid in his dictio, apt in his composition, and copious in his matter. He embraced the whole subject in his memory, divided it acutely, and omitted nothing which the cause supplied, either for confirmation or refutation. He was aided with uncommon powers of memory, which enabled him to repeat a whole oration in the words which he had previously conceived, without committing it to writing, and to go through all the arguments of an opponent in their order.

Though Hortensius died very rich, he lived in a very luxurious style; he possessed several magnificent country seats, furnished with parks, avaries, fish-ponds, &c. in which he very much delighted. He was accommmodated with his own hand to irrigate his fine plane-trees with wine, which underrendered the mandatarie of his leaving to his heir, 10,000 casks of that liquor. His daughter Hortenlia inherited her father's eloquence, and when the Roman women were required to render on oath an account of their property, preparatory to a heavy tax, she pleaded the cause of her sex with such force, that the decree was annulled. Her harangue, which was delivered on this occasion, before the triumvirs, Antony, Octavius, and Lepidus, was extant in the time of Quintilian, who speaks of it with applause.

Univer. Hist.

HORTENSUS, LAMBERT, a man of letters, was born at Montfort, in the province of Utrecht, in the year 1518. He derived his name from the circumstance of his father being a gardener. He studied at the university of Louvain, and was afterwards a professor in the college of St. Jerome at Utrecht, and entered into priets' orders. In 1544 he was appointed precentor of the college of Naarden, which he held till his death, notwithstanding other invitations. When the town was sacked by the Spaniards in 1572, his house was pillaged, and he had the cruel misfortune of seeing his natural fon maimed before his eyes. He himself would have shared the same fate, had he not been recognized and faved by one of his former pupils. He did not long survive this evil, but died in the course of a year or two. He was a general scholar, and published many works, chiefly in the Latin language. He translated four of the comedies of Ariflophantes into Latin verfe, and he wrote annotations on the first six books of the Æneid, and on Lucan's Pharsalia; the latter he so highly prized, that it was the only thing he was licentious to rave at the village of his house. They were published after his death at Utrecht in 1578. His chief work as an historian, was entitled "De Bello Germanico, a Carolo V. Cæs. geflo lib. vii."

Hortensius, Martin, an astronomer, was born at Delft in 1605, and died in the flower of his age, in 1639. He is known by a dissertation "De Mercurio sub febo vito, a Venere invito," also two discourses "De utilitate et dignitate Mathefes, et de Oculo ejufque Prefentiantis."

Horticulture, compounded of hortus, garden, and colo, I till. drefs, &c. the art of gardening. See Gardening.

Hortobagy, in Geography, a town of Hungary, on a river of the same name, which runs into the Théylle; 17 miles S.W. of Namas.

Horton, a township of Nova Scotia, in King's county; traversed by a river, which supplies the inhabitants with excellent salmon.

Hortulanus, in Ornithology, the name of a species of the emuhera, in the Linnean fyllem, though some writers have made this a dimiltent genus.

Hortus, a name used by some authors for the female genital parts of animals.

Hortus Sicus. See Herbal and Herbarium.

Horvatz, Horvos, Horvitz, Horvos, Hortulanus, Hortus, in Geography, a town of Croatia; 18 miles S.W. of Varafdin.

Horvos, an island in the gulf of Mexico, 25 miles long and three wide, separated by a narrow channel from the N. coast of Yucatan. N. lat. 21° 10'. W. long. 75° 1'.

Horwal, a town of Lithuania, in the palatinate of Minik; 28 miles S. of Robaczow.

Horitz, a town of Bohemia, in the circle of Czflau; 20 miles S.S.W. of Czflau.-Also, a town of Bohemia, in the circle of Koningitz. N. lat. 50° 18'. E. long. 15° 20'.

Hosancock Creek, a river of Pennsylvania, which runs into the Schaykill. N. lat. 40° 8'. W. long. 75° 30'.

Hosanna, in the Hebrew Ceremonies, a prayer which they rehearsed on the several days of the feast of tabernacles. It was thus called, because there was frequent repetition therein of the word Hosanna, a word expressive of joy, or, a word, we pray.

There are divers of these hosannas. The Jews call them hofchannoth; i. e. the hosannas. Some are rehearsed on the first day, others on the second, &c. which they call hosanna of the first day, hosanna of the second day, &c.

Hosanna Rathor, or Grand Hoshanna, is a name they give to their train of tabernacles, which lasts eight days; because, during the course thereof, they are frequently calling for the assistance of God, the forgivenes of their sins, and his blessing on the new year; and to that purpose they make great use of the hofchannoth, or prayers above mentioned.

The Jews also apply the term hosanna rabbah, in a more peculiar manner, to the seventh day of the feast of tabernacles; because they apply themselves more immediately on that day to invoke the divine blessing, &c.

Hosanporah, in Geography, a town of Hindooflan, in Bahar; 25 miles N.N.W. of Chuprah. N. lat. 26° 4'. E. long. 84° 50'.

Hose, from the Saxon hapo, a flocking. See Stocking. Hose, a term frequently made use of to signify the sheath from which the shoot of grain proceeds.

Hose in Hose, among Botanists, signifies one long hulk of a flower within another; as in the polyanthus. See Primrose.
Thefe two young Danes undertook an expedition to the coast of Guinea, in search of natural productions, where unfortunately the latter, a most ardent and intelligent botaniff, from whole reearches much was expected, met with a premature death.—Vahl. Enum. v. 1. 212.—Clafs and order, Dianthrea Monogynia. Nat. Ord. Verticillata, Linn. Labiate, Juil.

Gen. Ch. Cal. Perianth of one leaf, inferior, tubular, five-toothed, fringed. Cor. rindges, almost twice as long as the calyx; throat comprifed: upper lip of the limb erect, ovate, gibbous; lower one gaping, trifid, recurved. Stam. Filaments four, growing to the tube; the two barren ones very short; anthers kidney-shaped. Pfl. German superior, four-leaf; style thread-shaped, the length of the perfect flaments; stigma bifid. Peris. Berry spurious, formed out of the calyx; roundish and slightly ten-cornered, umbilicated by the teeth of the calyx, hollow within. Seeds four, ovate, in the bottom of the calyx.

Eff. Ch. Calyx tubular, five-toothed. Corolla rindgent, its upper lip concave. Stamens four, two of which are barren. Seeds four, within the pulpy calyx.

1. H. oppofita. Vahl. Enum. n. 1. — "Leaves opposite, oblong-ovate."—Native of bufpl places in Guinea. This shrub is about six feet high, having numerous opposite branches crossing each other, with a hairy line between the inferior of the leaves; these are two inches or more in length, ferrated towards the end, entire at the base, aromatic. Flowers white. Berry the fize of a currant, orange-coloured, downy.

2. H. verticillata. Vahl. Enum. n. 2. — "Leaves lanceolate, ternate."—Native of Senegal, and first discovered by M. Dupuis, formerly superintendant of the garden of the Thuleries.—Stam shrubby, branched. Branches square, fringed, slightly downy, hairy at the top. Leaves an inch and half long, ferrated, bordered both at the top and base, interfiled with reafious, bright spots, which are discernible by the help of a lens. The parts of frutification in this species are very similar to those of the latt. Panicle terminal. Bracteas minute, awl-shaped. Flowers small, clothed outwardly with whitish hairs.

HOSPINIAN, RODOLPHUS, in Biography, a learned Swif divin, was born at Altidorf, near Zurich, in 1547. From a very early period he was distinguished for excellent talents, which his friends encouraged and cultivated, by giving him a good education. In 1568 he was admitted into the miniftry, the duties of which he performed with much diligence and afliance at a country church a few miles from Zurich. After this he had the superintendence firft of the abbey-school at Zurich, and then of the Caroline school. Amidst the various occupations of his life he was enabled to compone some valuable works, of which the principal are, "De Tempis, &c. 3. De Temporis," "De monachis," "De felis Judentorum," "Hist. Sacramentaria," "Hist. Jefuitica." He was nearly a year deprived of his fight, notwithstanding which he continued to preach as usual, and in 1613 he submitted to the operation of couching, which succeeded to his wirhes. In 1623 his faculties became foon impaired, that he was reduced to a fcond childhood, in which he continued till his death in 1626. His works, which are enumerated by Bayle, were collected and printed in seven volumes folio.

HOSPIDALETTO, in Geography, a town of the bishopric of Trent; 35 miles N.W. of Trent.

HOSPITA, in Mythology, a farnme of Venus, under which appellation she was worshipp'd, and had a temple at Memphis, in Egypt.
HOSPITAL, Michael de l', in Biography, chancellor of France, was born at Auvergne in 1505. He was educated for the law in the most celebrated universities of France and Italy, and at the same time he greatly distinguished himself by his proficiency in polite literature. He was in early life made one of the auditors of the rota at Rome, the duties of which he quitted, to follow the law court at Paris. Here he passed through various high offices, continually rising in esteem for his ability and integrity. In 1560, he was elevated to the dignity of chancellor of France. At this period the kingdom was divided between the factions of contending interests. L'Hôpital was a true patriot, and preferred the honour of the crown and country, to that of any interest supported by the great. To carry his point he was sometimes obliged to give way, and even to consent to a severer edict against the Protestants; this he did with much regret, and he never ceased to advocate the cause of tolerance. In 1561, he was the champion of the decree which allowed freedom of worship to the Protestants. He was more than once accused of being himself a Protestant, and was excluded from those councils in which the bloody massacre was planned. The papal legate would gladly have removed him from office, which he was unable to do, till at length the whole influence of the court was bent on exterminating by violence the reformed religion. He now resigned his seats, and retired into the country to spend the remainder of his days, with his books and his friends, and in this retreat he declared that he enjoyed more happiness than he had ever done in public life. The felicity of privacy was cruelly interrupted by the detestable massacre of St. Bartholomew in 1572. It was imagined that he might, on account of his great integrity, be included among the number of victims, and when a troop of horse approached his house, he was asked if he would defend himself with firearms; "By no means," said he, "and if the wicket is not wide enough to admit the assailants, let open the great gates." The men, who were sent on the bloody errand, were overthrown by a manceuvre from the king, announcing that l'Hôpital was not among the proscribed, and was told that the authors of the deed had pardoned him his contant opposition to their plans; "I did not indeed know," said the excellent man, "that I had merited either death or pardon." He survived the shock but a short time, dying in the year 1660, in the sixty-eighth year of his age. His works include a number of "Latin poems," which have gone through many editions, and which are grave, but easy and energetic; also of "Harangues before the States of Orleans;" "Memoirs containing treaties of Peace," &c.; "A Discourse in favour of Peace," and other tracts. His eulogy, in better times, was made a prize subject by the French academy in 1777; and his statue was erected in marble by Lewis XVI., but his noble and manly conduct has erected to his memory a statue more durable than marble. "No one," says his biographer, "was more determined in resistance to injustice, and if ever he acceded to measures which he disapproved, it was only to prevent worse." Bayle. Moreri.

HOSPITAL, William-Francis-Anthony, marquis de St. Merne, a celebrated mathematician, of the same family as the preceding, was born in 1661. His genius for mathematical pursuits discovered itself at a very early period; for, being present one day at the duke de Rohan's, where some able geometers were speaking of a problem of M. Pascal's, which appeared very difficult, he ventured to say that he believed he could solve it. They smiled at the assertion, and probably regarded the foppied forwardness of a youth of fifteen with contempt; however, in a few days, he lent them a very neat solution, which gave them a very different idea of his talents. He entered the army, and rose to the post of captain of horse, but still retained his passion for mathematics, which he studied at the hours of leisure from military duty, though he was forced to do it in concealment, as an attachment to the sciences was thought unbecoming the dignity of a soldier. Distracted with this idea he quitted the army, and devoted his whole time to study. When he was little more than thirty years of age, he distinguished himself by the solution of problems drawn from the sublime geometry, which had been proposed to the mathematical world by John Bernouilli. In the year 1693 he was admitted an honourary member of the Academy of Sciences at Paris, and from this period the philosophical transactions of France, and those of other countries, were enriched by his papers. He published a work on Sir Isaac Newton's fluxions, entitled "Analyse des infiniments petits," being the first Frenchman that ever wrote on this subject. He died at the age of 43, in the year 1704, and after his death was published another mathematical work which he had left in a finished state, and which included "Les Sections Coniques, les Lieux Geometriques, la Construction des Equations, et une Theorie des Courbes Mechaniques."

HOSPITAL, popularly Spital, a place or building erected, endowed, or supported by charitable contributions, for the reception and relief of the poor, aged, infirm, sick, and otherwise helpless.

The word is formed of the Latin hospes, host or stranger. In the first ages of the church, the bishop had immediate charge of all the poor, both found and disfaced; also of widows, orphans, strangers, &c. When the churches came to have fixed revenues allotted them, it was decreed, that, at least, one-fourth part thereof should go to the relief of the poor; and to provide for them the more commodiously, divers houses of charity were built, which are since denominated hospitals.

They were governed wholly by the priests and deacons, under the inspection of the bishop.

In course of time, separate revenues were assigned for the hospitals; and particular persons, out of motives of piety and charity, gave lands and money for erecting of hospitals.

When the church-discipline began to relax, the priests, who, till then, had been the administrators of hospitals, converted them into a fort of benefices, which they held at pleasure, without giving an account thereof to any body, resorting the greatest part of the income to their own use; so that the intentions of the founders were frustrated. To remove this abuse, the council of Vienne expressly prohibited the giving any hospital to secular priests in the way of benefice; and directed the administration thereof to be given to sufficient and responsible laymen, who should take an oath, like that of tutors, for the faithful discharge thereof; and be accountable to the ordinaries. This decree was executed, and confirmed by the council of Trent.

In England, hospitals, founded for the more relief of the indigent and necessitous, are peculiarly called alms-houses; the name hospital being referred to such defined for the sick, aged, young, &c. See Corporation.

Any person feiled of an estate in fee simple, may, by deed enrolled in chancery, erect and found an hospital for the fullicence and relief of the poor, to continue for ever; and place such heirs, &c. therein as he shall think fit; and such hospital shall be incorporated, and subject to such visitors, &c. as the founder shall nominate. Also such corporatons shall have power to take and purchase lands not exceeding two hundred pounds per annum, so as the same be not holden of the king, &c. and to make leases for twenty-one years,
years, referring the accumulable yearly rent; but no hospital is to be erected, unless upon the foundation it be endowed with lands or hereditaments of the clear yearly value of ten pounds per annum. Stat. 39 Eliz. cap. 5.

This act was made perpetual by the 1 Jac. cap. 1. It is understood, in consideration of this statute, that if the lands given to a hospital be afterwards improved, they shall be enjoyed by the hospital, though they should be above the yearly value of two hundred pounds. And goods and chattels, real or personal, may be taken of what value soever.

(2 1nfl. 722.) But by 9 Geo. II. cap. 39, no lands nor money shall be conveyed or settled in trust, for the benefit of any charitable foundations, unless the appointment of lands, money, or personal estate, stocks in the public funds excepted, be made by deed indented, sealed, and delivered in the presence of two witnesses, at least twelve calendar months before the death of the donor, and be inrolled in chancery within six calendar months next after the execution thereof; and unless such stock in the public funds be transferred in the public books usually kept for the transfer of stocks, at least six months before the death of the donor, and take effect immediately and without the power of revocation. By 43 Eliz. cap. 4, the lord chancellor may issue commissions to take up misapportion of lands and goods, given to hospitals, which have no special visitors or governors. By 31 Eliz. cap. 6, the place of any person, taking reward for nominating an hospital, shall be void. By the aforesaid 30th of the 39 Eliz. cap. 5, it is provided, that all leases of estates for a term exceeding the number of twenty-one years, in possession, and on which the accumulable yearly rent or more, by the greater part of twenty-one years next before the taking of such lease shall not be reserved and yearly payable, shall be void. By 43 Eliz. cap. 2, all lands within the parish are to be affected to the poor's rate, and it has been determined by courts of law, particularly by Holt, in 1 Anne, that hospital lands are chargeable to the poor as well as others. (2 Selk. 527.) In the case of St. Luke's hospital, by 1 Geo. III. it was determined in general, that no hospital is chargeable to the parish rates, with respect to the feite thereof, except those parts of it which are inhabited by the officers, whose apartments are to be rated as single tenements, of which the said officers are the occupiers. By the annual acts for the lands-tax, it is provided, that the same shall not extend to charge any hospital, for or in respect to the feite of such hospital, or any of the buildings within the walls or limits thereof; or to charge any of the houses or lands, which on or before Mar. 25, 1693, did belong to Chrift's hospital, St. Bartholomew, Bridewell, St. Thomas, and Bethlehem hospital; or to charge any other hospitals or almshouses for or in respect of any rents or revenues, which, on or before March 25, 1693, were payable to the said hospitals or almshouses, for the immediate relief of the poor. But all such lands &c. belonging to any hospital or almshouse, or settled to any charitable or pious use, as were affected in the fourth year of W. and M., shall be liable to be charged. The principal English hospitals are the following:

Hospitals, Ake's, or Haberdashers', is an hospital situated at Hoxton, and erected in 1602, by the company of Haberdashers, in pursuance of the will of Robert Ake, esq. who left for building and endowing it 30,000l. This hospital is established for the maintenance of twenty poor haberdashers, and the support and education of twenty boys. Each of the pensioners in this hospital has convenient apartments, is provided with proper diet and fireing, three pounds yearly in money, and a gown every second year. There are also established salaries, &c. for chaplain, clerk, butler, porter, and other domestics.

Hospitals, St. Bartholomew's, is situated on the south-east side of Smithfield, and incorporated in the last year of the reign of Henry VIII. by the name of the hospital of the mayor, commonalty, and citizens of London, governors for the poor, called Little St. Bartholomew's, near West Smithfield. This hospital formerly belonged to the priory of St. Bartholomew, in Smithfield, founded by one Rahere, about the year 1122.

At the dissolution of the monasteries, Henry VIII. left five hundred marks a-year to it, on condition, that the city should add five hundred marks per annum for the relief of sick and poor people; but it was more largely endowed, for the use of sick and lame persons only, by Edward VI., by the munificence of the city and private benefactors. This hospital, having escaped the dreadful fire in 1666, was repaired and beautified by the governors in the year 1691. But the buildings became by length of time to ruinous and dangerous, that a subscription was entered into in 1729, for defraying the expense of rebuilding it, on a plan comprehend four detached piles of building to be joined by stone gate-ways, about a court or area. Four piles have been erected and finished; one of these piles contains a large hall for the refort of the governors at general courts, a compting-house for the committees, and other necessary offices; the other three piles contain wards for the reception of the patients, &c.

It is governed by a president, treasurer, &c. It is furnished with three physicians, and three master surgeons, besides as many affluent surgeons, an apothecary, and vicar. The officers of this hospital, are a cook, steward, rector, matron, and porter. This hospital, since its enlargement, is capable of accommodating four hundred and twenty patients. It extends relief also to a great number of outpatients. By the report of 1811, it appears that this hospital administered relief to 9740 patients in the course of the preceding year.

Hospitals, Bethlem, or Bedlam, was originally a priory, founded by Simon Fitzmurry, sheriff of London, in the year 1247, the 31st of Henry III.; but in the year 1547, king Henry VIII. gave this hospital to the city, who employed it for the accommodation of lunatics. The present edifice was erected in the city of London in the year 1676, at a charge of about seventeen thousand pounds. It was in length five hundred and forty feet, and forty feet broad, and contained a great number of cells, or rooms for the accommodation of those unhappy, who are maintained without any expence to their friends; except an allowance for bedding. At each end of this edifice were erected, in 1733, by the charitable contributions of the citizens, two wings, or spacious buildings, for the reception of poor incurable lunatics. But it became necessary very lately to take down the eaf wing, on account of its decay. The report of the number of incurables was, a short time since, 82, being 37 men, and 45 women; who, by an order of court in July 1807, pay each 7l. per week if sent by parishes, but if sent by friends, 5l. The number of patients capable of relief amount upon an average to 170; and it has been found, at a mean computation, that nearly two out of three are restored to mental sanity. Before this magnificent structure there was a pleasant garden, inclosed by a stately wall about seven hundred feet in length. This hospital, being united by the charter of Edward VI. to that of Bridewell, has the same president, governors, who consist of members of the corporation, and of others, who are made governors by
by benefactions of 520. each, treasurer, clerk, auditor, physician, surgeon, and apothecary; but each hospital has a steward, and inferior officers peculiar to itself. The management is entrusted to a committee of 45 governors, seven of whom, with the treasurer, physician, and other officers, attend every Saturday in monthly rotation for the admission of patients, and other concerns of the hospital. The income of this hospital, appropriated to curables and incurables, and arising from rents, &c., and dividends on government securities, amounts to £1,741. 15s. 10d. The number of patients in this hospital, on the 31st of December 1807, was 126, and of those admitted during the year 1808, was 87, the total 211; the number of those cured and discharged 52, of buried 12, and of patients in the hospital December 31st, 1808, 147. By the report of 1811, the number of cured and discharged in the preceding year was 81, of buried 7, and of patients remaining 147.

The decay of the buildings of this hospital has made it necessary to rebuild it; and the committee, upon mature deliberation, have determined to remove it to another situation. Accordingly, as the leaves of the bridge-house elates in St. George's fields and Lambeth-marsh fell in at Lady-day 1810, the corporation have agreed with the commissioners of those elates for a ground plot of nearly twelve acres, fronting the road leading from Newington to Westminster-bridge, part of which was formerly the site of the house and gardens called the Dog and Duck; and on this spot is proposed to erect a new edifice, capable of accommodating a greater number of patients than the present building can contain, and suitable to the munificence of the city of London. The statues of the two lunatics upon the pillars of the front gates of Old Bethlehem, which have been very much admired as monuments of art, were the work of Caius Gabriel Cibber, a native of Holstein, who came into England at some period previous to the reformation of Charles II. to follow his profession as a flautist.

Hospital, Bridewell, is situated in Bridge-street, Blackfriars, on a spot near the ancient river Fleet, where stood the palace in which King John held his court, and within the walls of which was a well dedicated to St. Bridget, or Bride, whence the palace, &c. derived its appellation. This palace had been very much occupied; it was the residence of Cardinal Wolsey during his prosperity, and after his fall of Henry VIII. particularly in 1532. After this time it was pulled down, and Bishop Ridley begged it of Edward VI., to be converted to some charitable use. The citizens of London addressed the king's council in 1552; and Edward VI., in the same year, by a deed between himself and the mayor, commonalty, and citizens of London, granted to them all the manor-house and parish of Bridewell, with the appurtenances in the parih of St. Bridget, Fleet-street, with other lands, and licence to purchase four thousand mark lands, besides the lands given them by his majesty in London and elsewhere, and to purchase so much land, and that the lands so given them should be discharged of all tenths and first-fruits. And out of the fuppressed hospital of the Savoy, he gave a great part (whole revenue was 720. mark land), besides bedd and furniture for the maintenance and employment of vagrants and idle perfons, and of poor boys; uniting it with Bethem hospital. The king was so delirious that this grant should be carried into effect, that he disowned by his will that it should be performed, and died soon after, on July 6, 1553. In 1557 the citizens of London preferred certain rules for the government of this hospital, and for the power of its governors and officers. (See Bridewell.) By an act passed in 1782, the union of Bridewell and Bethem was recognized, and the present method of appointing corporation governors was established or confirmed. The revenues of Bridewell hospital, at that time, May 1792, amounted to 425L. 13s. id. and of Bethem hospital, to 781L. 19s. 11d.; of which 228L. 17s. belonged to the fund for incurables. The front of this building, situated on the west side of Bridge-street, Blackfriars, has not for many years exhibited any part of the original palace. At present there is one vast quadrangle. The chapel is a plain edifice; the prison's gloomy front occupies the south-west corner; and the hall the greater part of the south side. The ciling of this large room, thirty-nine paces in length and fifteen in breadth, is horizontal, without any other ornament besides two flowers, where the lutes are suspended. At the west end, and over the chimney, is a large picture by Holbein, representing Edward VI. in the act of delivering the charter for this hospital to the mayor and citizens of London. There are some other pictures which we have not room to particularize. It appears (see Bridewell,) that this institution is of a mixed nature, partaking of the hospital, the school of industry, the work-house, and the prifon for correction. The school is conducted by six masters of different arts, who are elected by the governors, viz. a printer, book-binder, ferrif, orris, and galloon weavers, and a silver-smith, to whom forty-eight youths are bound from Christ's hospital, as apprentices, who are clothed at the charge of Bridewell hospital, but maintained by their masters, who receive the whole profit of their work. They were formerly habited in a blue jacket and trowsers, with a white hat; but this singularity has been of late judiciously abolished in favour of the common clothing of other perfons: when they have served their apprenticeship of seven years, they receive their freedom, and a gift of ten pounds towards establishing themselves in business. The work-house, and the prifon for vagrants, idle and disorderly perfons of both sexes, are separated into solitary rooms, where employments are provided, which is a part of their punishment to execute, and which are exercised by their talk-masters, and sometimes accompanied with coercion. Although Bethem and Bridewell hospitals are united, and they are governed by the same members, distinct accounts of their respective revenues are kept. The accounts exhibited at Christmas 1808, stated a net income of 620L. 6s. lid., arising from net rents of the elates and the dividends on 300L. 3 per cent., to which legacies and donations are to be subjoined. The expenses attending the arts-masters and apprentices amounted to 645L. 4s. 6d.; the charges attending the vagrants to 700L. 19s.; the falaris and gratuities to the several officers and servants, &c. amounted to 158L. 14s. 2d., making a total of 253L. 17s. 8d., which exceeded the receipt by 326L. 7s. 3d. The qualification of a governor is a donation of 50L. paid upon election, which is in the general court. This hospital is under the immediate management of a president, treasurer, chaplain, physician, clerk, steward, and other inferior officers. The number of persons received into this hospital, during the year 1809, amounted to 1261, including 279 vagrants or disorderly perfons, committed by the lord mayor and aldermen, and ordered for hard labour or correction, 917 perfons to be forwarded to their respective parishes, and 55 apprentices.

Hospital, Charter-house, or Sutton's. See Charterhouse.

Hospital, Christ's, popularly called the Blue-coat Hospital, was anciently a monastery of Grey friars, founded by Rahere, the first prior thereof in the time of Henry I., or, as others say, by John Ewin, citizen and mercer. It was dissoluted by Henry VIII. and granted by him to the city
city in 1547, and the grant to the citizens was confirmed in 1552, by charter of Edward VI., who converted it into a hospital for poor children; who are supplied with all necessaries and conveniences, clothed, dined, and taught.

Since its first endowment, it has received abundance of new donations. Besides the numerous benefactions of private persons, the city allows this house the benefit of superfintending and licensing the carts of London; and a duty of about 3d. upon every cloth brought to Blackwell-hall, where clerks are kept to receive it. The citizens, by King Edward’s charter, are incorporated governors of his several foundations in the city and liberties of London by the name of the mayor, commonalty, and citizens of the city of London, governors of the poiffeions, revenues, and goods of the hospitals of Edward VI. &c. A great part of it was burnt down by the great fire in 1666; but is again rebuilt by the care of the governors; though not without incurring a great debt, and anticipating the revenues of the hospital; all which incumbrances have been long since discharged.

Formerly, a thousand poor children, most of them orphans, were maintained on this foundation; eight or nine score yearly put out apprentices, and the girls to service; but the number has fluctuated from various causes.

Besides the children that are maintained within the walls of this hospital, there is a considerable number of the leaf; and youngest provided for in the country, viz. at Hertford, in Hertfordshire, where there are a school-house, a master’s house, and several houses for nurses employed in taking care of the children. The number of children under the care and charge of this hospital, in 1810-11, was one thousand two hundred and thirty-two; one hundred and seventy-two were put out apprentices, and eight buried.

Here were two mathematical schools; the first founded by king Charles II. Aug. 19th, 1674, but they are now united. Youths are there taught several parts of practical mathematics, particularly navigation, to fit them for apprentices to masters of ships; there is also a grammar-school (whence the most improved boys are yearly sent to the university), a writing-school, and a school for the girls, where they learn to read, to few, and to mark.

In the mathematical school, called the new royal foundation of king Charles II., forty boys are qualified for the sea, who wear appropriate badges, and whose clavses are examined by the elder brethren of the Trinity-houfe, ten of whom are yearly appointed to ship-masters, and ten others received into their places, who have attained a competency in writing and Latin; and the governors appoint forty more. All the other scholars are bound apprentices at fourteen or fifteen years of age for seven years; or, if properly qualified, are sent to either university of Oxford or Cambridge, where they are maintained for a like term: one scholar is sent every year, except on the return of every seventh year, when two scholars are sent; the scholars have their choice of the college to which they are to go, but Pembroke-hall, in Cambridge, is generally preferred, as most advantageous to them; and one scholar is also sent to Oxford in eight years. The allowance paid to each of them during the first seven years is 60l. per annum. On St. Matthew’s day, 21st of September, yearly, the lord mayor in state, with the president, aldermen, fiffs, treasurer, and governors, and other company, assemble in the great hall after divine service at Christ’s church, to hear orations from the elder scholars; one of whom speaks in Latin, and the other in English, the latter of these having spoken in Latin in the preceding year, is now elected off to college, and leaves the school in about a month afterwards:

on this occasion a glove is handed about among the audience for their contribution.

The masters of these schools are, a grammar master, who is afflicted by an under master, a mathematical master, and two writing masters, who have 100l. per annum each, for their salaries, besides houses. There are also two school-milliners. The grammar master hath an addition of 20l. yearly for catechising the boys, and his usher is allowed 50l. a year. There are likewise a drawing master and music master.

The children are admitted by an order of committee and treasurer, signed by the chief clerk. Their education consists of arithmetic, writing, reading, navigation, Latin, and Greek. Their drefs is the same as that used in the time of Edward VI., being a blue cloth coat or tunic, reaching to the feet, with yellow breeches and stockings, and a round bonnet or cap too small to cover the head, and it is therefore generally taken in the hand. An examination of the children in the grammar school takes place in the months of March and September by an experienced person, appointed by the governors. The upper master examines the under master’s highest form twice in the year, and takes such as he judges ready for his instruction. The holidays allowed are eleven days at Easter, including Sunday; one week at Whit; and at Bartholomew-tide three weeks, and at Christmas 15 days, and the usual Saint’s days, &c. The catechizer teaches the children the fundamental points of religion three times in each week, and at other times visits the wards for the instruction of the inmates. The English reading-master is authorized to assemble all the children belonging to any two wards in the grammar school, from 11 to 12, three times in a week, in order to obtain a knowledge of their progress. Thus every child in the 12 wards is examined once in 14 days. He may subtitute for this purpose under his own observation any boy intended for the university, and he appoints a marker in the several wards, who is to observe and correct mistakes in the reading of prayers, &c. and he reads himself occasionally for example. If the marker’s diligence is approved, he receives a silver medal of the founder. The two writing masters have two others. An exhibition of drawing and specimens of writing takes place in the hall the 31st of March and 31st of September; and the writing is said to be of such superlative excellence, that the writer would procure the writer a situation in the most fardious merchant’s counting-house.

Among the peculiarities of Christ’s hospital, a fight is exhibited from Christmas to Easter, every year, which no other institution, lay, civil, ecclesiastical, or ecclesiastical, has ever equelled in their grand ceremonies, or which is more calculated to impress the heart of a spectator with the lively sentiments of sympathtic pleasure: we mean the supper of all the children on Sunday evenings at fix o’clock, to which strangers are admitted by tickets.

The great hall, which was rebuilt after the fire of London, contains several tables, which are covered with table-cloths, wooden platters, and buckets of beer, with bread and cheese. The treasurer and governors take their seats at the upper end, at a semi-circular table; the boys, attended by the nurlers of their several wards, enter in order, and arrange themselves on each side of the hall; strangers are admitted, who go along the centre of the hall to the upper end; the masters of the school, the steward, and the matron, take their places there also; and the nurlers preside at each table, on which a great number of candles are placed, and thehe, with many lamps and a large lumiere, illuminate the room. The ceremony then commences by the steward striking upon...
HOSPITAL.

one of the tables three strokes with a mallet, which produces a profound silence; one of the boys intended for the church, having ascended a pulpit on one side of the hall, then reads the second lesson for the afternoon service of the day, and an evening prayer composed for the occasion, at the close of which the reprobate of "Amen," from about eight hundred youthful voices, has a very interesting effect; a plainsong hymn is next sung by the whole assembly, accompanied by the organ: the same youth then delivers the grace, after which the boys take their seats, and the supper proceeds. When the repast is concluded, the steward again strikes the table as before, and the boys instantly arrange themselves again on each side of the hall, and a grace is said from the pulpit: an anthem is then sung, after which the boys collect all the fragments into small baskets; and each ward, preceded by its nurse with lighted candles, marches in order past the upper table, where they bow to the governors, and file off to an adjoining school-room, the doors of which are thrown open to receive them, and the ceremony is closed.

There is no person who has ever witnessed this ceremony that does not feel the sublime and the tender emotions: it is a combined offering of the gratitude of hundreds to the throne of Divine Mercy!

The officers of this hospital are, a president, treasurer, physician, chief clerk, under clerk and receiver, surgeon, apothecary, wardrobe-keeper, and assistant clerk, steward, matron, &c. The number of governors, some of whom superintend this hospital, in their several appropriate departments, is very considerable; and it must be allowed that no institution of such magnitude is, upon the whole, better conducted: though some have thought that the diet, which is plain and simple, might admit of useful alterations, particularly with regard to vegetables, &c., without any material addition of expense. The qualifications of governors are 200/., and a present of 200/. more, which is expected upon election. This institution is supported by the revenues of its endowments and funds, and also by legacies and bequests.

HOSPITAL, Emmanuel, is situated in Tothill-fields, in Westminster, and was founded by lady Dacres in 1601, for 20 aged single men and women, each of whom have an allowance of 10l. per annum, with the liberty of bringing up a poor child. The city of London has this charity in trust, with 200/. a-year for its support, issuing from a lease of 199 years, at the expiration of which, the whole manor of Brainburton, in the county of York, amounting to above 600/., per annum, is devised for the augmentation of this foundation. In 1735 the court of lord mayor and aldermen erected a school-house and dormitory adjoining to this hospital, for the reception of twenty poor boys and girls, to be elected out of the parishes of St. Margaret, Westminster, and of Chelsea and Hay's in Middlesex, to which the parishes of St. John, Westminster, has since been added; by the court of aldermen, none of the children being admissible under seven years of age, nor to be maintained there after 14, who are supplied with all the necessaries of life; the boys are taught to read, write, and accompt, and the girls to read, write, and do plain-work.

In consequence of the increased value of the lands appropriated to the support of this institution, the governors obtained an act of parliament in 1795 for augmenting the number of objects of this charity; and after obtaining this 20, five men and five women were admitted as out-pensioners, with such allowance as the court should think fit. And also besides the 20 children in the hospital, eight other poor boys are clothed and educated at the hospital's expense, their ages being at the time of election from seven to ten. The number of girls in the hospital has been increased from 10 to 12. In consequence of this act the 10 out-pensioners are allowed 10l. per annum, till houses in the hospital become vacant, when they are admitted, and other out-pensioners appointed in their stead.

The school was opened at Brainburton, to which eight poor boys were sent, and there clothed, maintained, and educated at an easy expence, compared with that of the hospital in town. In the year 1802 the court of aldermen issued new ordinances and regulations, similar to those of the year 1795. The salaries and allowances to the master and mistresses, and to the warden and steward, matron, and poor men and women in the hospital, and also to the out-pensioners, were settled during the pleasure of the court, and have since been increased; and the court undertook to pay all the bills of expenditure. The charges are as follows:

The master, with the house and garden free of taxes, &c.

The miftresses, do.

The poor men and women, in-pensioners, and with a chaldron of coal, &c.

The poor men and women, out-pensioners, &c.

The warden and stewards, and in addition to the 18l. as.

The matron, do.

All these allowances are payable quarterly, and the coal delivered at Michaelmas. A diet table is also prescribed.

The whole charity now consists of a master and mistresses, and 20 in-pensioners, viz. 10 men, of whom one is the warden, and 10 women, of whom one is the matron, whose allowances have been lately increased; five men and five women, as out-pensioners: also ten boys and ten girls, who are in-pensioners, and have a school-room, who are all apprenticed to trades, with a premium of 10l. half paid at the time of binding, and the other money when they have served half their apprenticeship.

HOSPITAL, Fever. See House of Recovery.

HOSPITAL, Foundling, was established, at the solicitation of Thomas Coram, esq., by royal charter, in the 11th year of George II. and incorporated by the name of "The governors and guardians of the hospital for the maintenance and education of exposed and deserted young children:" and the powers granted by charter were enlarged and confirmed by a statute of the same year. The corporation of this hospital is allowed to purchase lands or tenements to the yearly value of 4000/. This charity is under the management of a president, the king being patron; six vice-presidents, treasurer, and governors. The subordinate officers are a chaplain, morning preacher, afternoon preacher, secretary, solicitor, matron, school-master, treasurer's clerk, and organist. This hospital has two physicians, a surgeon, and apothecary. In 1742 the noble building in Lamb's-conduit fields for the use of this hospital was begun to be erected; one wing was finished in 1743; the chapel was begun in 1747, and in 1749 orders were given for building the other wing of the hospital, which, together with the treasurer's house, was ready for occupation in 1752. The whole building was originally calculated to hold 400 children; and the talents of several eminent artists were employed in contributing to its embellishments; among whom were Mr. Hogarth, Mr. Hayman, Mr. Highmore, Rybbruck, &c. Mr. Handel, upon the building of the chapel, gave an organ, and the benefit of his oratorio of Messiah, the performance of which was conducted by himself; this he repeated several years, which produced to the charity 6700l. and by his will he bequeathed to it his property in the music. Before the end of the year 1752 the hospital
hospital had received 1042 children, of whom 550 were then under its protection; but the expense far exceeding the income, application was made to parliament for assistance; and in 1756 the house of commons, after passing three introductory resolutions, voted 10,000l in consequence of which, before the 31st of December 1757, during an interval of little more than a year and a half, the number of children that were received amounted to 5510. Large sums were afterwards granted, and the number of infants, in 1760, increased to 6000, which they had no adequate income to maintain. The corporation received continual parliamentary assistance, during 15 years, till 1771, when it ceased, at an average of not less than 33,000l per annum; and the number of children in 1769 was reduced to 1000, by apprenticing all who could be placed out. The country hospitals were discontinued, and the establishment reduced to its permanent income. The improvement of the revenue by granting building leaves of the lands, belonging to the hospital, was the next method adopted. Ten acres of the purchased of lord Salisbury had been occupied by the hospital and its conveniences; and after several delays and demurrers, it was agreed, in 1788, that the ground which layouth of and adjoining to the road leading from the gates of the hospital to Gray's Inn Lane should be let on building leases. In the years 1783, 1793, and 1794 the plan of building leaves was fully adopted, and in subsequent years carried on very much to the embellishment of the vicinity of the hospital, and to the improvement of its revenues. The emoluments arising from these improvements, and from the increase of governors and benefactions, have enabled this corporation to replace the flock which they had been under a necessity of parting with for the support of the charity, to repair the hospital, to liquidate its outstanding debts, and at the same time gradually to enlarge the establishment of its children; and it affords the most encouraging prospect of further augmentation. The ordinary age of reception of children is under two months, and upon the hearing of the petitions, the character and exigency of the mother, and deprivation of the father, are investigated. The age, after which children cannot be received, is 12 months, unless they are the children of soldiers and sailors, the time of whose reception is extended to five years of age. The children, after admission, are numbered and registered, and their billets made up; for this purpose the secretary writes a number on a slip of parchment, and affixes it to their clothes; and great care is taken that these numbers remain fixed to the children whilst they continue at surfe; he then makes up the billet, which contains the number, sex, and propounded age, the date of reception, and any particular writing or token brought with the child, which is also marked with its number. The billet is marked on the outside with the number, date, and letter M or F to distinguish the sex. These billets, being the only means which can enable the governors to know the children, in case they should be required for, are kept with great secrecy and care, and are never opened but by order of the general committee. After rigour and baptism, the children are committed to the care of inspectors, who find out proper nurseries, and superintend their conduct: when the children attain the age of four or five years, and not before, they are remanded to the hospital, when the secretary returns receipts for them to the inspectors; and they are then inoculated or vaccinated. The mortality of children, committed to the care of nurseries, is very small; the average of those who died under 12 months in 10 years being one only in six, and for the last four or five years even less than that proportion.

The children admitted to this hospital are not only nurfed, but educated and employed under proper regulations, and provided with all necessaries, till they attain the age appointed by parliament for their discharge, viz. twenty-four for males, and twenty-one for females, unless they be previously married with the consent of the committee: at such time, the general committee, at their discretion, may give them clothes, money, or necessaries, not exceeding the value of ten pounds. In the mean while, the corporation of the hospital may employ the children educated and maintained here in any sort of labour, or manufacture, or in the tea service; and bind such children apprentices, or place them out as servants, or mariners, to any husbandman, master or captain of a flipp, or other person, until the aforesaid respective ages. The girls are distributed into three classes, under the care of three different mistresses, by whom they are taught needle-work, and reading, to affix in the house-work, kitchen, and laundry, &c. The boys are put out apprentices at twelve or thirteen years of age, and the girls at fourteen; and they are disposed of with great attention on the part of the committee. The reports as to their subsequent conduct, which is particularly inquired into, have been very favourable. By a report of sir T. Bernard in 1798 it appears, that out of 252 apprentices, 166 were doing well; and of the remaining 86, 15 had turned out ill, partly through their own fault and partly through that of their masters. The proportion of good servants in place and good apprentices far exceeds the number of the others; and there are many respectable persons at present in London, married and settled in businesses, who have been nurfed, educated and apprenticed by this charity. By an attention to cleanliness and diet the children have of late been more healthy than formerly.

Hospital, French, in the parish of St. Luke, was erected in the year 1716; and the governors of it, by letters patent of Geo. I. anno 1718, were constituted a body politic and corporate, by the appellation of "The governor and directors of the hospital, for poor French Protestant and their descendants, residing in Great Britain."

This institution owes its rise to the charity of M. de Cafligny, master of the buckhounds to king William III., as prince of Orange, who bequeathed 1000l for a building and its maintenance. The interest of this fund was permitted to accumulate, and aided by voluntary contribution; so that a fund was raised sufficient to erect a building for the accommodation of about 80 poor persons. The corporation, by the subseuent contributions of benevolent refugees and others, has been enabled, at different times, to enlarge the buildings, so as to admit 200 poor, who are either very aged, or disordered in mind or body. They are supplied with every necessary for their subsistence and relief. The governors of this hospital is vested in a governor, deputy-governor, and 37 directors. The governor remains in office three years; the deputy-governor is chosen for one year; also a treasurer, secretary, and minister. Eight directors are chosen at the four quarterly courts to constituted a committee, who meet at the hospital every Saturday. Five visitors are chosen annually from among the directors, who, with the physician and surgeon, make a general visit in June, and report the state of the whole institution to the next court. The treasurer and secretary are chosen annually; the minister performs divine service in the chapel of the hospital, and visits the sick at least once a week. The physician attends regularly once a week, and at any other time when required. The surgeon and apothecary attend at least three times in the week. The steward has the superintendence of the house and family. The chapel is commodious, in which an annual sermon is preached upon Wednesdays.
HOSPITAL.

By Geo. II. cap. 29, the net rents and profits of the estates forfeited by the attainer of James late earl of Derwentwater, and of Charles Radcliff, were applied in the first place to the completing of the building of Greenwich hospital; and it is hereby enacted, that all feamen in the merchant's service who shall happen to be maimed in fighting, not only against pirates, but against an enemy of his majesty, &c. shall be admitted into and provided for in the said hospital, as well as feamen maimed or disabled in the king's actual service; and in the next place, the whole net rents of those forfeited estates shall be for ever applicable for the support of the said royal hospital, for the better maintenance of the feamen therein, worn out and become decrepit in the service of their country. This law was farther explained and amended by Geo. II. cap. 30.

Provision is made for securing the payment of the fixpence per month from privateers by Geo. II. cap. 21, and for securing prize money belonging to the hospital by Geo. II. cap. 24. The governors are empowered to grant out-pensions to decrepit feamen, by Geo. III. cap. 16, and pensions perforating or falsely assisting the name and character of out-pensioners, shall be guilty of felony without benefit of clergy; and those who receive half-yearly pensions, null, together with the printed bill delivered to them by the commissioners, produce a certificate under the hand of the minister and churchwardens, where they reside, testifying that they are the persons named in such bill.

The pensioners belonging to this hospital are clothed in blue, and allowed rockings, shoes, linen, and a shilling a week for other necessaries. The victualling is according to the allowance of Chelsea hospital, viz. four men to a mess, each mess to contain four pounds of flesh, a gallon of beer, &c.

The governors of this hospital are the great officers of state, and pensioned in high posts under the king; and it is under the more particular inspection and government of twenty-four commissioners, a governor with an annual salary of 100l. and clerk; a lieutenant-governor, whose salary is 40l. a year; four captains, allowed 25l. a-year each; and seven lieutenants, with 11s. a-year each; a treasurer, whose salary is 20l. with two clerks; secretary with 16l. a-year and clerk; auditor, whose annual salary is 100l. and clerk, surveyor with 20l. salary, clerk of works at five shillings a day; a physician at ten shillings a day, a surgeon with an annual salary of 15l. a servitor and two assistants, dispenser with 50l. a-year and his assistants, two chaplains with a salary of 15s. each, steward with a salary of 100l. and three clerks; clerk of cheque with 100l. salary and three clerks; brewer, three matrons, organist, messengers, two chief cooks and four mates, scullery man and two mates, butler and two mutes, porter and barber. For a particular account of the building and its establishment, see CHEST.

HOSPITAL, Guy's, situated in the parish of St. Thomas, Southwark, was founded in his life-time, by Thomas Guy, esq., a very wealthy citizen and bookseller of London. For this purpose he took a lease of a piece of ground belonging to St. Thomas's hospital, for the term of 599 years, at a ground-rent of 30l. per annum; the foundation of the intended hospital was laid in 1722, and the fabric was finished before the death of the founder, which happened in the year 1724. The charge of erecting and furnishing this hospital amounted.
HOSPITAL.

amounted to the sum of £18,753. 16s. 1d. and the sum left to endow it was £219,495. 6s. 4d. and upwards. The governors of this hospital were incorporated by act of parliament, made in the 11th year of Geo. I. anno 1725, under the title of "The President and Governors of the Hospital founded at the sole cost and charges of Thomas Guy, esq." and under this title they are empowered to purchase, either in perpetuity or for a term of years, any estate not exceeding £12,000 per annum. The number of governors appointed to be chosen from thofe of St. Thomas's hospital, by the founder, is 60; and it is enacted that if the number does not exceed 40, the vacancies shall be supplied by the Lord Chancellor, lord keeper, or commissioners of the great seal, lords chief justices of the king's bench and common pleas, and lord chief baron of the exchequer, so as to make up the number of 50. It is also enacted, that the management of the hospital be referred to a president, treasurer, and 21 governors; forming a committee appointed by a general court, seven of whom are annually changed; this committee is empowered to chuse, and at pleafure to remove, all officers and servants employed in the hospital, except the physicians, surgeons, clerk, and chaplain, who are elected by the general court, to appoint their salaries, to admit objects of charity, and in general to transact the affairs of the hospital subjed to the inspection and control of a general court; and this general court has power to make any by-laws for the better government of the corporation. This hospital, fo liberally endowed by its founder, was established for the reception and relief of upwards of 400 fick and deceased poor objects; besides twenty incurable lunatics, who are provided for in a separate building. Since the deceafe of Mr. Guy, the governors have taken a leaf of an additional spot of ground, for which, with the former, they annually pay to St. Thomas's hospital the sum of £100. On this ground they have erected two handfome wings; in the centre of one wing there is a spacious hall and rooms for public bufinefs, and opposite to it in the other a neat and elegant chapel, in which there is a finely executed statue of the founder by Mr. Bacon. The corner house in one wing is for the residence of the treasurer, and the other houses are for the chaplain, feward, and apothecary. This hospital is under the medical inspection of three physicians and three surgeons, who are allowed £200 a-year each, an apothecary, who has 90l. a-year for himself and lffitant, and a house. The officers are a clerk, chaplain, feward, accompanier, marfon, burler, and lffitant; surgery man, porter, beadle, keeper of the lunatic men, and a keeper of the lunatic women. It contains 13 wards and 411 beds; and the number of patients admitted into this hospital, at an average of ten years, has been 2244 yearly; of whom 2014 have been discharged, and 230 have died: under the prudent conduct of the treasurer and governors, it does great honour to the liberality of its founder. The day of admission to this hospital is Wednesday. To this hospital belongs a theatre for chemical, medical, and anatomical lectures. On one evening in the week medical subjects are debated for the improvement of the science and practice. A library is also a part of this establishment, well furnished with professional works, and a collection of analytical preparations. We shall add under this article, that Mr. Guy (see Guy) has bequeathed to the president and governors of Christ's hospital, a perpetual annuity of £400 for taking into the said hospital four children yearly, at the nomination of the governors of his hospital: preference being always given to his own relations, who have never failed to offer themselves. To his poor aged relations he gave annuities during life to the amount of £800, and among his younger relations and executors the sum of £7,500, together with the sum of £1000 for discharging poor prisoners, within the city of London, and counties of Middlesex and Surrey, who could be released for the sum of five pounds.

He likewise erected an alms-house, with a library at Tamworth, where his mother resided, and which he represented in several parliaments, for the use of 14 poor men and women; to whom he allowed certain pensions during life, and at his death, for their future support and putting out children apprentices, &c. he bequeathed a perpetual annual sum of £115. Mr. Guy also built and furnished, at his own expense, in the year 1707, three wards on the north side of the outer court of St. Thomas's hospital; and gave to the fame £100 per annum, for eleven years immediately preceding the foundation of his hospital. Some time before his death, he removed the frontpiece of the said hospital of St. Thomas, which flood over the gate-way in the borough, and erected the fame in the place where it now stands, fronting the street; and having enlarged the gate-way, rebuilt the two large houses on the sides thereof, and erected the flately iron-gate between them, at an expense of between 2 and 300l. To many of his relations he gave flatted allowances of 10 or 20l. per annum, and to others, money for advancing them in the world.

HOSPIHAL OF JERUSALEM. See Hospitaler.

HOSPITAL, Jews, called יִרְאֶה יִשְׂרָאֵל Beth-olem, or house for relief of the fick, was founded by subscription in 1748. It was first established in Leman-street, Goodman's-fields. This charity, which administers medicines and advice gratis, was maintained by a certain sum allowed by the synagogue, and private contributions, amounting, soon after its first establishment, to about 500l. a-year. An enlargement becoming neccessary, a more commodious building was erected in 1792 at Mile-end, Old-town, which contains accommodation for 14 sick men, and as many sick women, and for eight lying-in women; besides 21 beds for the old and indigent. The beds for the sick are for four wards, those for lying-in women in a separate apartment, and those for the old and indigent in ten rooms, with a long-fitting room, which has two fire-places. The contributions for the support of this charitable institution are general throughout the Portuguese congregations by offerings made at the synagogue, and their elders grant from their general charity fund from 270 to 300l. annually towards its support; they have also a small endowment. This hospital dispenses medicines to all persons who hold any employment under their synagogue, and to all the poor of their congregation.

HOSPITAL, German and Dutch Jews, פֶּרֶז בֵּית-הֹלֶם, New-yaack, i.e. dwelling-place of justice or of charity, an establishment situated in Mile-end, Old-town, of wider extent than that of Beth-olem, which arose from the philanthropic exertions of Benjamin and Abraham Goldsmith, esqs. who, in 1795, commenced a collection among their friends for the purpose of relieving the poor of the classes denominated German Jews. The sums contributed by Jewish and Christian beneficence enabled them, in 1797, to purchase 20,000l. of imperial annuities of three per cent. and by accumulation of interest and increase of donations, the aggregate sum, in 1826, amounted to the value of 22,000l. of stock, at the current price of that period. After previous deliberation it was agreed to erect an hospital for the reception and support of the aged poor, as well as for the education and industrious employment of both sexes. Ten thousand pounds of three per cent. consols bank-annuities were purchased, and this sum, together with the former stock, was transferred to trustees as an inviolable fund for its endowment, yielding 300l. per annum. In February, A.D. 1806, the freehold on which the hospital was afterwards erected, was purchased for 112
December, chaplain, attended a meeting held in March, officers are elected, and also a house-committee of 24, and two auditors. This institution is under the management of a general committee of 12 governors, which attends at the hospital on Sunday, weekly. None are considered as proper objects of this charity who do not belong to one of the three established synagogues of German Jews in London; nor can any be admitted under 55 years of age. The boys are admitted from 10 to 13 years of age, and maintained till the expiration of their apprenticeship. The girls are admitted from 7 to 10 years of age. The present officers are, a patron, president, two vice-presidents, two treasurers, a physician, surgeon, solicitor, and secretary.

Hospital, Lock (lock being derived from loke, a house for lepers,) near Hyde-park corner, was instituted in the year 1746, for the relief of venereal patients only. Every gentleman subscribing five guineas a year, or upwards, shall be a governor of this hospital, and whoever gives a benefaction of fifty-pounds at one time becomes a governor for life. This hospital is under the direction of a president, seven vice-presidents, two treasurers, and a committee of the governors, who meet every Thursday for the business of the institution. It is attended by a physician, two surgeons, and two visiting apothecaries. The officers are a chaplain, house-surgeon, secretary, collector, and matron. By a report circulated in November 1789, it appears that the number of patients perfectly cured to that time amounted to 30,577; many persons of both sexes were thus restored to their families, who might otherwise have lingered out a loathsome and miserable existence; many abandoned characters were reclaimed by the religious instructions afforded them; and the progress of the contagious disease, dreadful to the sufferer and destructive to politerity, was materially arrested. The Lock Asylum is an appendage to the hospital, which provides for females after cure, who have no means of accommodation and support when they leave the hospital, and who might otherwise be urged by necessity to return to that course of vice and infamy which they have abandoned. This institution has been found of singular utility. The number of women admitted to this asylum from July 1787 to Lady-day 1809, has been five hundred, many of whom have been preferred from ruin, and rendered useful members of the community. The asylum is under the superintendence of a patron, president, three vice-presidents, a chaplain, and secretary.

Hospital, London, in Mile-end road, was instituted in 1749, principally by the instrumentality of John Harrison, esq., its first surgeon, and incorporated in 1759, 32 Geo. II. This hospital, which was first founded in Prebent-green, Goodman’s fields, is now supported, in a very large and commodious building, by voluntary contributions, for the relief of all sick and wounded persons. The in-patients are supplied with advice, medicine, diet, lodging, washing, and every other kind of comfortable allowance: the out-patients receive medicines and advice daily. None are admitted into the hospital with infectious Diseases, or the venereal disease, or who are athmatic or consumptive, or deemed incurable or improper for admission by the physicians or surgeons; but such persons may be relieved as out-patients. The average number of patients in this hospital at any one time is about 180, but its wards are 12 in number, and would contain nearly 400. This hospital has fulfilled during a period of 68 years, and in that time has relieved 507,852 to Jan. 1, 1809, which is an average of 7466 persons in each year. During the year 1809, the in-patients amounted to 1400, and the out-patients to 877. The governors, in 1809, made an interesting appeal to the benevolence of the public, and with such success, that the committee were enabled immediately to discharge the hospital debt, amounting to £3242. 10s. Id. In consequence of other liberal contributions, they began with the admission of 37 in-patients, and they have since been progressively augmenting the establishment, according to the extent of their power. The funds of the hospital, at the close of the year 1808, consisted of £1076 bank stock, 225l. 5 cent. navy subscription of bank on bank stock, 1804; 200l. 4 cent., £5,526l. 2s. 2d. 3 per cent. consols; 9779l. 9s. 8d. 3 per cent. reduced; 400l. 3 per cent. O.S.S. ann. 457l. 3 per cent. New ditto; 310l. India stock; 571l. 16s. South Sea stock; 500l. 3 per cent. 1726; 50l. bond; 35l. 8s. 8d. cash; land and houses near the hospital ad valorum.

The charity is under the government and direction of a president, five vice-presidents, a treasurer, and six governors, who, by giving a benefaction of thirty guineas, or more at one time, become governors for life; or who subscribe five guineas or more per annum. A house-committee of thirty governors is annually appointed at the quarterly court, in December, one of whom is chosen chairman; and they meet every week at the hospital to transact the necessary business.

There is also a committee of accounts, consisting of twelve governors, appointed at the quarterly court in June for one year, who meet there quarterly to examine and audit the bills and accounts, and a medical committee also consisting of twelve governors, elected annually at the court in December, who examine all the medicines and drugs. The management of the house is inspected by two governors, appointed visitors by the house-committee. Three physicians and three surgeons attend this hospital: the officers are a chaplain, apothecary, secretary and receiver, steward, and matron. Every governor is entitled to send one in-patient at a time, and four out-patients. Subscribers, that are not governors, may send out-patients; the day of admission is Tuesday.

The “Samaritan Society” is an appendage to the London Hospital, instituted A.D. 1791, for the relief and prevention of various circumstances of distress, not within the provision of public hospitals, and depending upon donations and bequests. Annual members contribute one guinea, and benefactions of five guineas constitute members for life. The affairs of this society are conducted in the consulting-room of the hospital, allotted in 1792 for its meetings and business, by a committee of nineteen for general purposes; a committee of eleven for public communications and correspondence; two auditors, a treasurer, an almoner, a secretary, and collector.

Hospital, St. Luke’s, for Lunatics, in Old-lane Road, was instituted in 1751. The extensive building for this hospital was erected at an expense of 2000l. raised by voluntary contributions, upon leasehold ground belonging to St. Bartholomew’s hospital: the site is held for a term of 50 years, renewable every fourteen years, on payment of a fine of 200l. and at the yearly rent of 200l. It was completely finished at the close of the year 1786; and on the 11 of January, 1787, the
the patients were removed into it. The house accommodates 300 patients, who are distinguished by two lists or classes, 200 on the curable list, and 100 on the incurable list.

It appears, from the printed state of this hospital, that the number of patients received into it from the opening on the 30th of July, 1751, to the 21st of April, 1809, inclusive, amounted to 9242, of whom those discharged incurcd and received again at 72. a week, are 329. Of these 391 have been discharged cured, and 3101 discharged uncured, 783 discharged as idiots, 438 died, and 251 taken away at the desire of friends. Of the incurable, 50 were taken away at the desire of friends, 14. died, and 18 were cured.

The property of the hospital consists of the building and premises in Old-street; 64,000. Lord con. 3 per cent. annuities; 38,000. reduced annuities; 22,500. Old South Sea annuities; 5000. 4 per cent. annuities; 225. New South Sea annuities; 1000. reduced annuities; divers legacies unrivileged, besides contingent and reversionary legacies; an annuity of 3l. 5l. and another of 100 guineas by the late Samuel Whitbread, &c. The income of this property is considerably increased by incidental benefactions and legacies, and by cash received from the boards of incurables, all which, with a balance in hand, amounted, in 1828, to 9057. 16s. 3d., and the expenditure amounted in the whole to 7932. 17l. 3d.

Perfons paying the entire sum of twenty guineas or upwards, for paying seven guineas at least, and signing an agreement to pay 3l. 18s. yearly, for the four next succeeding years, are admitted governors of this hospital; nine of whom constitute a general court, held on the third Wednesday in February, every year. At this court one president, four vice-presidents, a treasurer, a general committee, physician, surgeon, resident, apothecary, secretary, matron, and accountant, shall be elected for the ensuing year. The general committee consists of the president, vice-presidents, and treasurer, and of five governors, named as follows in the leaf of the ground on which the hospital is built, and of all persons who pay in their own right 100l. or upwards, who are standing members of it, and of such other thirty governors resident in the bills of mortality as are elected at the court in February.

The general committee meets monthly or oftener, if necessary, and is empowered to transact all the necessary business of this hospital, and to appoint a house-committee and sub-committees. The physician and surgeon attend on every committee day, and one other day in the week, and as often as occasion requires. The resident apothecary is excluded from all other practice. No fees are taken by any officer. Patients are admitted into this hospital according to the order of time in which their petitions, previously signed by a governor, have been delivered to the secretary, and without any expense, except that the parish poor shall provide their bedding, which they may take away at their discharge. But no person can be admitted into this hospital who is not poor and mad; or who hath been a lunatic more than twelve calendar months; or who hath been discharged uncured from any other hospital for the reception of lunatics, or who is troubled with epileptic or convulsive fits; or who is deemed an idiot; or who is infected with the venereal disease; nor any woman with child; nor any child under the age of twelve, nor any person above the age of seventy years. Besides a petition, the governors require two printed certificates; one testifying the above particulars, signed by the minister and churchwardens, or overseers of the poor of the parish or place where the proposed patient resides; and the other to the same purpose, signed by some physician, surgeon, or apothecary, who hath visited such patient; which signatures must be attested upon oath.

Upon notice being sent from the committee for the patient to be brought for examination, there must be left in writing with the secretary, within three days afterwards, the names, busines, and place of abode of two substantial housekeepers, refusing within the bills of mortality, who must be present precisely at the hour when the patient (not being parish-poor, or receiving alms or support from any public body or community) is to be admitted upon the payment of three pounds; and if such patient be parish-poor, or has received alms or support from any public body or community, then upon the payment of six pounds, and to enter into a bond of one hundred pounds to take away the patient when discharged by the committee; which sums of three pounds and six pounds are not returnable unless the patient dies or is discharged within one month after admission.

It is also provided, that the general committee may receive immediately into this hospital any patient who shall have been discharged cured, in case such patient relapse within two months; and that such patients who have been discharged uncured, not exceeding 100, shall be admitted by rotation; on condition of the payment of seven millions per week for each, till the charity shall be enabled to lessen that expense. The patients are not exposed to view; but their friends are allowed to visit them every Wednesday morning.

HOSPITAL Lying-in. There are several hospitals of this kind in the cities or suburbs of London and Westminster.

The Queen's lying-in hospital was founded in 1732 for the purpose of receiving poor pregnant women, as well married as unmarried, in separate wards, and also of attending them at their own habitations, within a limited circuit. It is now fixed at a house in Baywater; and the government of the charity has been vested in a president, four vice-presidents, a treasurer, and a committee of eighteen governors. An annual subscription of three guineas constitutes a governor, entitled to recommend one in-patient, two to be delivered at their own habitations, and fix for advice; and a subscription of 31 guineas at one payment, entitles to the recommendation of one in-patient, fix at their own habitations, and twelve for advice, yearly. It is computed that upwards of 45,000 women have received the benefit of this hospital in its various branches.

Quarterly meetings are held at the hospital; and the committee meet every Tuesday. This hospital was restored in October 1809, and under the active exertions of its president the duke of Sussex, has now a fair prospect of permanent utility. Her majesty is patroness, and it is under the care of a consulting physician, and physician in ordinary, a surgeon and man-midwife, an apothecary and secretary, a matron, nurses, and collector.

The Middlesex hospital for sick and lame, and lying-in married women, in Mary-le-bone Fields, was instituted for the first description of patients in 1735; and for the second in 1747; and for patients afflicted with cancer in 1792. It is under the direction of a patron, a president, 12 vice-presidents, two treasurers, and a committee of the governors; the qualification for a governor is an annual subscription of three guineas, and of a governor for life 50 guineas at one payment. A quarterly general court is held four times in the year. All general courts and weekly boards may appoint committees for carrying on the business: 24 governors are appointed for a weekly board to meet every Tuesday; and 12 for a medical committee, including the physicians, man-midwife, and surgeons, to meet every Saturday. The president, vice-presidents, treasurers, chaplains, physicians, man-midwife, surgeons, apothecary, secretary, collector, and matron, are elected at a quarterly or special general
During the apothecary, provided, and furnished, besides the physician and surgeon of the cancer-ward. The domiciliary officers are a chaplain, secretary, apothecary, and matron, who reside in the house, have salaries, and are provided with lodging, washing, and board. The house-surgeon also resides in the hospital, under certain stipulated regulations. A sufficient number of midwives to attend women at their own habitsations is provided. The day for admittance of patients is Tuesday.

The British lying-in hospital for married women, in Brownlow-street, Long-acre, was instituted in 1740. This hospital is governed by a president, four vice-presidents, a treasurer, and a committee of 15 governors, who meet every Friday to receive the women recommended, and to direct the ordinary affairs of the house. The qualification of an annual governor is a subscription of five guineas or upwards per annum, and of a perpetual governor a single payment of 30 guineas, each of whom may present two women in the year. This hospital is occasionally visited by three physicians, and one surgeon; and it is provided with an apothecary, chaplain, secretary, matron, and midwife, six nurses, and 62 beds. Female pupils, being widows or married women, not less than 25 years of age, and of approved character, are permitted to attend this hospital, for instruction in midwifery, and have a right to stay in the hospital six months. They are to board in the hospital, and dine at the steward and matron’s table; and on leaving the hospital to receive certificates of their qualification. The expenses of instruction and board are settled by a general court. The flock of this charity in the public funds amounts to 200l. 12s., and its expenditure is about 110l. a-year, for which they have the dividends of the above-mentioned flock, and annual subscriptions of about 900l. per annum, besides benefactions and legacies, and board of women, who reside in the hospital before and after the period of three weeks, allowed for their lying in and recovery, and pupils. The committee of this hospital have preferred an account of those who have died, from which it appears that in the first 10 years of the institution one woman died in 42; in the fifth 10 years, one died in 288; in the sixth and last 10 years, one in 216; and from the 20th of September, 1866, to the 25th of March, 1868, not one woman died out of 501. In the first 10 years one child died in 15; in the fifth 10 years one died in 77; and in the last nine years and a quarter, one died in 92. The proportion of boys to girls born is about 18 to 17; of still-born, about one to 25; of women bearing twins, one to 84, the whole number being 52. If similar tables were preferred by other institutions of a like kind, they would furnish useful data in calculations relating to population and political economy.

The city of London lying-in hospital for married women, in the City road, was instituted in 1750. The government of this hospital is referred to a president, 12 vice-presidents, and a treasurer, chosen annually from among the governors and select committees. The subscription of 30 guineas constitutes a governor for life; those who subscribe five guineas, or three guineas per annum, are governors for so long as they continue their subscription. Each governor for life has the privilege of relieving eight patients in a year, and of having two of them on the books at a time. Subscribers of five guineas may relieve five patients, and those who subscribe three guineas may relieve four patients. A double subscription requires a double privilege. The affairs of the hospital are conducted by a committee of 24, of whom the treasurer is one, who meet at the hospital every Wednesday. Four of them preside, by rotation, for two succeessive months, at the public baptisms; and at the Midsummer court fix retire, and fix are elected to supply their places. The officers, besides the president, vice-presidents, and treasurer, are a preacher and a chaplain, four physicians, two of whom practice more particularly in midwifery, a surgeon, an apothecary, a secretary, and a matron, who is a skilful midwife, and resides in the house, superintending the nurseries and servants, and the whole domestic economy. The property of this hospital consists, besides its leafhold premises, of 11,000l. three per cent. consol bank annuities, and 10,000l. reduced annuities, and two annuities of 5l. and another, during the life of the duke of York, of 25l. The whole annual expenditure amounts in general to about 1500l. supplied by the dividends on its capital, legacies, subscriptions, and collections at the chapel, and at the anniversary meeting. Pupils are allowed to be received who pay to the charity for their lodging and board during their stay in the hospital, besides some fees to the matron and medical officers. The present building, at the entrance of the City-ward, was begun in October, 1770, and completed at an estimated charge of 3500l. so as to be open for the reception of patients in April, 1773. It was licensed for the public reception of pregnant women, pursuant to an act of parliament, passed in the 13th year of the reign of George III. (13 Geo. III. c. 82.) This hospital, which in 1809 had fulfilled 59 years, has received, in that time, 24,902 poor married women, of whom 23,196 children have been born. During the year, ending Lady-day, 1809, their number was 413, and the male children born were 227, and the females 186. Out of the whole number, 202 women have been delivered of twins, and two women had three children at the birth.

The Westminster new lying-in hospital, on the Surrey side of Wellminton-bridge, was instituted by subscription in the year 1765. It is governed by a president, four vice-presidents, a treasurer, and a committee of governors. The qualifications of governors are various. An annual subscription of three guineas entitles to recommend three patients, three out-patients at their own habitations, and any number for advice, and to vote at elections. An annual subscription of five guineas entitles to recommend five patients, five at their own habitations, and any number for advice, with a vote at elections, &c. A subscription of 50 guineas constitutes a governor for life, entitled to recommend yearly three in-patients, three at their own habitations, and any number for advice, and to vote at elections, &c. The privilege of recommending patients is extended in proportion to the subscription. There are four quarterly meetings at the hospital in the year; and a weekly board, consisting of any number of the committee annually appointed in January, is held at the hospital every Tuesday, for the general affairs of the institution. The physicians practising midwifery are allowed to take pupils, two of whom may reside in the house for three months, and board for a stipulated price, at the matron’s table: female pupils are also allowed upon the same terms. One of the physicians attends at the hospital every Tuesday and Friday, from 11 till 12 o’clock, to give advice in the several disorders incident to child-bearing and infancy. It is attended by two physicians and six surgeons, a physician extraordinary, an apothecary, and a surgeon. The officers are a committee, chaplain, and matron or midwife, confidant resident in the hospital, superintending the nurseries and servants, &c.

In connection with lying-in hospitals, we may mention two or three institutions for the purpose of delivering poor married women at their own habitations. An useful institution of this
HOSPITAL.

this kind dates its rise in the year 1757, and is under the direction of a president, six vice-presidents, a treasurer, secretary, and governors. An annual subscription of one guinea, or more, for a benefaction of 10 guineas or upwards, constitutes a governor. An annual governor for one guinea may recommend eight objects within the year, and in proportion for a larger sum, and the governor for life recommends the same number annually. This institution is under the direction of a president, six vice-presidents, a treasurer, a consulting physician, three physicians and acconcheurs. The subordinate officers are a secretary and collector. The midwives are 27 in number, who reside in all parts of the town. During the first 50 years of this society the deliveries amounted to 175,983; and in the year 1808 to 4102. Another institution of the same kind, called the "Benevolent Institution, for the sole purpose of delivering poor married women at their own habitations," was established in January, 1788. It is supported and conducted on a plan similar to that of the institution last mentioned. The officers are a president, seven vice-presidents, a treasurer, a physician, secretary, and 40 midwives. Another society of a like kind was formed at Tottenham, near London, in August, 1791.

HOSPITAL, Magdalen, in St. George's Fields, was instituted in the year 1778, for the relief and reformation of prostitutes. The queen is patroness of this charity; it is under the direction of a president, six vice-presidents, treasurer, and committee of 32 governors. It is attended by a physician, two surgeons, and two apothecaries. The domestic officers are a chaplain, steward, secretary, matron, and assistant, and meilenger and assistant. Twenty guineas constitute a governor for life, and an annual subscription of five guineas is a qualification for a governor for one year, which subscription, when it amounts to 25 guineas, qualifies a governor for life. Four general courts are held in every year; and at the general court in April, the committee, and all officers, except the president, are elected. The committee, consisting of 32 governors, meet at the hospital every Thursday; and two of them, in rotation, attend at the chapel every Sunday at morning and evening service, when a collection is made previously to admission. This hospital was first established in Prescott's-court, Goodmans-fields; and the new building in Blackfriars' road, St. George's-fields, was opened in the year 1778. An act of incorporation was granted by parliament in 1790. The new hospital is calculated to receive about 360 penitents every year; and during the period of its subsistence more than two-thirds of the women who have been admitted have been reconciled to their friends, or placed in honest employments or reputable services. A very considerable number have been married, and have become respectable members of society; but some, as might naturally be expected, have relapsed into their former errors. A probationary ward has been instituted for the young women on their first admission; a separation of those of different descriptions and qualifications has been established; and apartments have been fitted up in the lodge for the residence of the chaplain and his family, that he may with the greater facility continue to devote his time and attention to the instruction of the women. Each class is entrusted to its particular assistant, and the whole is under the inspection of the matron. It appears by a statement, extracted from the books of the hospital, that from the 1oth of August, 1757, to the 7th of January, 1808, 3,765 women have been admitted, and that of these 2,335 have been reconciled to their friends, or placed in honest employments or reputable services. A very considerable number have been married, or troubled with fits or incurable disorders; 72 have died; 573 have been discharged at their own request; and 506 discharged for improper behaviour.

An institution, in aid of the Magdalen hospital, was founded in the year 1808, under the appellation of the "Female Penitentiary," the external management of which was confided to a committee of 24 gentlemen, together with a treasurer, a secretary, and assistant; and the interior to a committee of 24 married ladies. The establishment was fixed at Cumming-house, Pentonville, Islington, by the purchase of a long lease of the house and adjoining ground, to which it has since added a contiguous building for a temporary infirmary. The penitentiary-house is divided into six apartments; a temporary ward for cases of emergency, two probationary wards, wards for persons fully admitted after probation, a ward for diseased subjects, a sick ward, and a refractory ward; a part of the house is appropriated to divine service. This institution is attended gratis by a physician, surgeon, and apothecary. The matron resides in the house.

HOSPITAL, St. Peter's, at Newington Butts, was erected by the company of Flibmongers, by virtue of letters patent of king James I. in 1618, for the reception of divers of their poor members, who had penitents bequeathed them by the wills of some of their company.

HOSPITAL, Royal, for disabled soldiers, commonly called Chelsea-Collage.

The building was originally begun by king James I., in the 5th year of his reign, for a college to confit of a number of learned divines, who, being furnished with books and all means of subsistence, might devote their time to the study and teaching of controversial divinity, especially those points in dispute between the churches of England and Rome. Accordingly he incorporated a provost and fellows, by the title of king James's college, in Chelsea. The corporation was endowed by his letters patent, with the reversion of certain lands in Chelsea, and authorized also to receive of his loving subjects lands not exceeding, in the whole, the yearly value of 500l. Every thing being previously settled, king James laid the first stone of the intended college; but for want of money the building went on slowly; and, at length, before an eighth part of the model was executed, it stood still. In this state it remained for several years; but in the year 1616 the king sent letters to the archbishop of Canterbury, requiring him to stir up the clergy in his province to contribute towards it; in conseqquence of which collections were made in several parishes of England, but their produce was small, and was swallowed by the fees and collectors. The corporation, however, though the building was stopped, was nominally kept up during the life of king James I. The troubles under king Charles I. occasioned all thoughts of completing the work to be laid aside. After the restoration, king Charles II. erecting a convenient hospital for the reception of sick, maimed, and imperannuated soldiers, converted the unfinished buildings of this college to that use; whence the hospital has retained the title of the "College." It was founded by king Charles II., carried on by king James II., and finished in the reign of king William and queen Mary, by Sir Christopher Wren. The whole expense of this structure amounted, as it is said, to 150,000l., and the extent of the ground is above forty acres.

The building is very spacious and magnificent; its figure is a: the middle or front part whereof consists of a chapel and hall; the other two lines, being four stories high, are divided into wards or galleries, two in each story; containing each twenty-six distinct apartments for the foot soldiers. At each of the four corners of the main building, there is a pavilion, in one whereof is the governor's lodging, and the council.
council-chamber; the other being lodgings for several of the officers of the house. Before the main building, there are four wings or out-buildings; one for the infirmaries, another for several officers of the house, another for old maimed officers of horse and foot; and the fourth for the baker, laundress, &c. The number of pensioners in the house is, in general, estimated at about 400, besides officers and servants in the house: the out, or extraordinary pensioners, are also very numerous; and these, upon occasion, do duty in the several garriions, from whence draughts are made for the army, &c. Their allowance is 7l. 12s. 6d. a year each.

The pensioners are all provided with cloaths, diet, washing, lodging, and firing; and have a weekly allowance of 8d. for their pocket-money.

The qualifications required to be admitted of this body, are, that the candidate bring a certificate from his superior officer that he has been maimed or disabled in the service of the crown; or that he has served the crown twenty years, which must be made appear by muster-rolls.

To defray the charges of this hospital, there is a considerable fund paid yearly out of the moneys of the army; besides one day's pay of each officer, and each common soldier, every year, which, in time of war, amounts to a very considerable sum. In case of a deficiency, it is supplied by Parliament.

For the administration of this hospital there are commissioners, a governor, whose salary is 500l. per annum, a lieutenant-governor with 400l., a major with 270l., an adjutant with 100l., two chaplains with 100l. each, a physician and surgeon, whose salaries are 100l. a-year each, besides surgeon's mates and apothecary, a treasurer, who is the paymaster-general of the land-forces for the time being; and his deputy and clerk, secretary and regifter and clerks, agent and pay-master to the out-pensioners and his clerks, comptroller, steward, house-keeper, organist, clerk of the works, &c. &c.

HOSPITAL, or Corporation, Scots, a charitable institution which commenced in 1665 by the voluntary association of respectable merchants, tradesmen and others, and which obtained a charter of incorporation by letters patent under the great seal of England, bearing date the 20th of June 1665. By these, the persons described in the charter were empowered to erect an hospital in the city and liberty of Westminster, for the maintenance of old or decayed artificers of the Scottish nation, and for training up their children to handicraft employments. In 1673 this corporation was enabled to erect a hall, with fix adjoining tenements, for fulfilling the purpose of the charity, in Blackfriars. Afterwards it became necessary to apply to the crown for an enlargement of the numbers, powers, and privileges of the corporation. Accordingly new letters patent were issued, bearing date the 16th of November, 1676, by which 50 affiants were added to the former eight governors; liberty was granted to establish their hospital either in London or Westminster; and they were empowered to purchase and to hold lands to the yearly value of 500l., by the name and style of "The Master, Governors, and Affiliates of the Scottish Hospital, of the Foundation of Charles II."

The design of an hospital, however, was afterwards abandoned; and in its place was substituted the wiser mode of afflicting and relieving the poor objects at their own habitations. The charter of 1676 having been found insufficient by its provisions to render the institution sufficiently extensive in its beneficial effect, application was made to his present majesty for a new charter of incorporation, which was obtained, bearing date the 28th of November, 1775, by which the corporation is re-established under the ancient name and style of "The Scottish Hospital of the Foundation of Charles II." and the government vested in a president, six vice-presidents, and a treasurer, to be elected annually on St. Andrew's day, or the day after, and the number of governors left unlimited. A committee is also chosen on the same day, consisting of 20 governors, besides the president, vice-presidents, and treasurer, who are of the committee, for conducting the affairs of the corporation. The officers of the society are a chaplain and secretary. By the charter there must be five general councils held every year; and the committee meet on the second Wednesday in every month, at the hall of the corporation in Crane-court, Fleet-street, to receive the petitions of the patients recommended by the governors, and in order to distribute the charity. A donation of 10 guineas constitutes a governor for life; and a subscription of one guinea or upwards, annually, qualifies to be an annual governor. In conformity to a bye-law, it is the practice, in order to form a capital, to invest, in some one of the public funds, one-half of every donation of 10 guineas and upwards to 20, and the whole of every donation of that last amount, or beyond it.

The annual subscriptions, and a moiety of the lower donations, are applied towards the regular monthly expenditure. Every governor, whether annual or for life, has the privilege of recommending one, and only one, distaffed object for relief. This institution may be justly denominated an "Hospitall of Out-Patients:" the objects of it being supported and relieved by weekly, monthly, or quarterly allowances in money, and with medical assistance and advice at their own habitations; and such of them as are destitute of returning to their native country for the benefit of their health, or to spend the remainder of their days with their relations and friends, have their passages by sea paid, and money advanced to supply their immediate wants, by which they have not only the benefit of an hospital and work-house, without the disagreeable circumstances attending them, but all the comforts of their families and friends reserved for them.

The number of poor, lame, and sickly persons relieved, and passages to Scotland paid for, by the hospital, annually for five years, have been as follows:

HOSPITAL, Small-Pox, or hospital for relieving poor people afflicted with the small-pox and for inoculation, was instituted by voluntary subscription in the year 1746. The object met with very general encouragement, and several houses remotely situated from one another, were engaged in subserviency to the design. This hospital afterwards consisted of two houses, at a due distance from each other, in airy situations. A house for preparing patients for inoculation was erected at Pancras, and that for receiving them when the disease appears, and for accommodating patients who have it in the natural way, was then in Cold-bath fields. The new building at Battle-bridge St. Pancras, was finished and opened at Michaelmas 1767, for the reception of patients before inoculation. The whole expense of the building, and its accidental charges, amounted to 8955l. 19s. 11d. In December 1767 there were 300 patients for inoculation in the hospital. The hospital in Cold-bath fields requiring a general repair, and the governors being pleased of freehold ground at Pancras, on which the inoculation hospital flood, and where they had sufficient room for a new building, determined to erect a new edifice in the room of the other, which needed repair. Accordingly in
HOSPITAL.

1792 a plan was obtained, and a special committee was appointed to conduct the business. It was actually begun in May 1793, and completely finished in June 1794, and the patients were removed into it in under the direction of the medical officers. The whole subscription for this purpose amounted to 597 l. 18s. 8d.; and the building charges amounted to 75l. 5r. 2d. beyond that sum. A new set of rules was framed, and one apothecary and one matron were constituted to take the direction of both houses, under the superintendence of the physician. Soon after the practice of vaccination became prevalent, Dr. Woodville, physician of the hospital, first introduced it Jan. 21st, 1799, and adopted it very generally during the following year, that greatly assisting Dr. Jenner in his researches and experiments: and in the space of three years from that time, 9200 were vaccinated, without any complaint of unsatisfactory practice. In 1801, their number increased to 11,800, of whom 2500 were afterwards visited by various inoculations; and the progress was so rapid that 4290 were vaccinated in 11 months. In 1802 the number of vaccinated patients had increased to 15,715; and no failure of success appeared. After this time the new practice seems to have declined in reputation, for in the following year only 2862 were vaccinated at the hospital. In 1806, Dr. Adams having succeeded the deceased Dr. Woodville in the office of physician, vaccination was slowly recovering from its depression, and from the monthly tables of the hospital in 1809 it appeared, that the in and out-patients vaccinated amounted to 2906, and those of various inoculations to 2538. In 1807 vaccination further declined; but there was no fatality in the hospital in the natural disease during five months. From the report communicated by Dr. Adams to the college of physicians, it appears, that 20,324 had been vaccinated by the institution since its commencement in 1799, of whom only 18 had afterwards taken the small-pox casually; and that three years were the critical period at which the greater part of them had taken it. The prejudice, however, against vaccination prevailed. During the year 1808, the patients relieved in the casual small-pox amounted to 132, those for inoculation to 1266, and those of vaccination to 1525; and the total number of these, since 1799, amounted to 23,197; of casual patients, since the first establishment, 21,886, and of variolated patients to 47,171; making together 92,566. Dr. Lottenton states, in favour of vaccination, that not more than four have died in 64 thousand vaccinated patients. (See Cow-pox.)

This society is supported without charter by voluntary contribution; their property consists of the freehold estate at Pancreas, containing four acres of land; 8000/ in reduced bank annuities, and 9000/ consols, and 32l. 7s. 2d. imperial annuities. The receipts generally amount to about 1450l. per annum, and the expenses generally exceed that sum. The king is the patron of this institution, and the establishment is governed and conducted by a president, six vice-presidents, a treasurer, physician, secretary, resident surgeon and apothecary; and matron, a house committee of 13 governors, and a committee of seven auditors, chosen annually. Thirty guineas constitutes a governor, and five guineas an annual subscriber; and any double subscription gives a double privilege. Smaller sums are gratefully received, but give no privilege. Every governor may recommend one patient into each house at a time. Two half-yearly courts are held before Midsummer and Christmas. The house-committee of 13 meet on the first Thursday in every month to manage the whole concerns of the institution. The physician preferes, inoculates, and takes the general oversight and direction of the family; the secretary receives legacies, donations, subscriptions, &c. and keeps all the accounts and minutes, &c.; the apothecary, who is also a steward, is resident at the hospital, and keeps an accurate register of the medical transcriptions, and enjoys the matron respecting the provisions and household direction, and attends all the committees; the matron's office comprehends every thing which is commonly included in that of midwife of a family. No officer can receive any fee for any of his services. Both hospitals are plain brick buildings, that for inoculation and the other for the natural small-pox, being contiguous, but entirely disjoined from one another, and communicating only by a covered passage. The air of the situation, and the cleanliness which is preferred through both hospitals, and the good order maintained by the vigilance of the resident surgeon and the affiduous attention of the matron, render these hospitals well deserving the notice of every friend to humanity.

HOSPITAL, Sutton's. See Charterhouse.

HOSPITAL, St. Thomas's, in Southwark. is established for the same purposes as that of St. Bartholomew.

It was originally founded a hospital by Richard, prior of Bermondsey in 1213, and surrendered to king Henry VIII. in 1558; in the year 1551, the mayor and citizens of London, having purchased of king Edward VI. the manor of Southwark, including this hospital, repaired and enlarged it, and admitted into it 260 poor, sick and helpless objects; upon which the king, in 1553, incorporated it together with the hospital of Christ, Bridewell, Bethlehem, and St. Bartholomew. This ancient structure, much damaged by fire and fire, was rebuilt by voluntary subscription in the year 1609; and by additional buildings greatly enlarged; in consequence of which it consisted of three beautiful figures; to which the governors, in 1732, added a magnificent new building, consisting of several wards, a brew-house, and other necessary offices, at their own expense. It now consists of four quadrangular courts; in the first are wards for women; in the second two chapels, the lesser for the private use of the hospital, and the larger parochial; in the same court and adjoining to it, are the houses of the treasurer, and other officers; in the third court are several wards for men; the fourth hath also wards, hot and cold baths, a surgery, theatre, apothecary's shop, &c. The number of in and out patients relieved by this hospital, at an average of six or seven years, may be stated at 9000, at an expenditure of about 1500l. Thoese of the last year appear by the return of 1811 to be 8718. The governors of this hospital are the lord mayor and court of aldermen, and the number of others, who, on receiving a governor's staff, give a benefaction of 30l. or upwards, is unlimited; but it is commonly between four and five hundred. They choose their officers and servants, who are, a president, treasurer, hospitalier or chaplain, besides the minister of the parish, who is paid by the hospital, three physicians, three surgeons, apothecary, clerk, receiver, steward, matron, butler, and brewer, baker, cook, almoner and servant, an almoner clerk in the compting-house, two porters, four headmen, nine dovers, nineteen watch-women, a chapel-clerk and sexton, and one watchman. The house contains eighteen wards, and about 485 beds.

HOSPITAL, Westminster, or Publick Infirmary, was instituted in the year 1719, at the expense, and by the contribution of several benevolent individuals, for the relief of the sick and needy from all parts. This hospital was admitted by a recommendation signed by any governor, excepted, which are admitted without recommendation at all hours of the day or night; and several beds are reserved for them. A benefaction of 30l. or upwards, or of three

K.K.

guineas
guineas or more per annum, qualifies the donor to become a trustee. A board of trustees meets every Wednesday morning to transact the affairs of the charity; and four quarterly general boards are held for the supervision of its concerns. The capital of this hospital consists in several funds of 111,500l. 17s. 4d. three per cent. The inalienable capital for the incurables amounts to 21,368l. 13s. 1d. in several funds of three per cent., and the maintenance, clothing, and medicines are charged at 20s. per week, which does not exhaust more than one-third of the income appropriated for them. The queen is the patroness of this hospital; and it is under the direction of a president, nine vice-presidents, a treasurer, a secretary and receiver, three physicians, three surgeons, and an attendant surgeon.

Besides the hospitals already enumerated, there are royal hospitals, such as that at Haslar, near Portsmouth, for sick and hurt seamen and marines, and the royal hospital at Plymouth, and many others, supported by the benefactions of private and voluntary contributors, which provide relief for almost every species of disease or injury. For a particular account of all hospitals in London, and all public charities and benevolent establishments, for the relief and instruction of the poor; see a work, the refuit of much investigation and labour, and written with the most laudable design by A. Highmore, eq. 1809; entitled, "Pietas Londinensis; or the History, Defign, and Prefent State of the various Public Charities in and near London."

Hospitals, Comp. are either general or regimental.

The general hospitals are of two kinds, viz. the flying hospital, attending the camp at some convenient distance, and the stationary hospital, which is fixed to one place. In the choice of both, it will be better to have them in towns than villages, as the former will afford larger wards, besides more of other conveniences; these wards should be as airy as possible.

As to the disposition of hospitals, in regard to preserving the purity of the air, the best rule is to admit but few patients into each ward. It will also be found a good expedient, when the ceilings are low, to remove some part of them, and to open the garret-floor. The doors and windows may likewise be opened, and ventilators used to purify the air of every ward. In winter-hospitals, the wards are to be warmed with chimneys, and never by floves; for though the latter may warm a large ward better, and at a less expense, yet by scarce making any draught of air, they will be apt to increase its putrid quality; whereas a fire, kept up in a chimney, acts like a current ventilator.

The general hospital should receive only such sick as the regimental ones cannot conveniently contain, together with those who cannot be removed with the army. Without this diffusion of the sick, the general hospital, in bad seasons, would have a greater number than could be well attended; and what is equally, if not more pernicious, it would be too much crowded, by which means the contagion would spread, and the mortality be rendered more general.

Regimental hospitals are of the greatest importance, and therefore should be supplied with blankets and medicines from the public stores, with an allowance also for nurses and other necessaries. Nor are they to be maintained in the field only, but also in winter-quarters, as there will always be a great many more sick than can be taken care of in the general hospital.

Barns, stables, granaries, and other out-houses, but above all, churches, make the best hospitals, from the beginning of June to October; for as the greatest danger arises from foul air, which cannot be compensated by diet or medicine, we may lay it down as a rule, that the more airy and large the hospitals are, the less danger there is of the infectious spreading. Pringle Obser. on the Diseases of the Army, p. 104, f.'q.

Hospital, Fever, in Medicine. See Fever and Typhus.

Hospital Ship. See Ship.

Hospital, in Geography, an island in the river St. Lawrence, Upper Canada, in front of the township of Edinburgh, containing about 100 acres.

HOSPITALER, one that entertains and provides for poor people, travellers, &c.

The appellation is chiefly given to certain communities of religious; as, the hospitalers of Elfeet in Essex, instituted to take care of lepers; hospitalers of St. John Baptist, of Coventry; hospitalers of St. Julian; hospitalers of St. Leonard, at York, &c.

The religious hospitalers generally follow the rule of St. Augustine. Most of them pretend, that St. Martha was their first foundress, and chose her for their patron, because the entertained Jesus Christ at her house. Some of them go back to the patriarch Abraham for their founder.

There are also hospitalers among the military orders; such as the knights of St. Lazarus, and St. John of Jerusalem.

Hospitalers, Hospitarii, more particularly denote an order of religious knights, who built an hospital at Jerusalem, wherein pilgrims were received. To these pope Clement V. transferred the effects and revenues of the Templars; whom, by a council held at Vienne, he suppressed, for their many and great misdemeanors.

These hospitalers were otherwise called Knights of St. John of Jerusalem; and are the same with those whom we now call the Knights of Malta.

HOSPITIALER, in Mythology, is a name which the ancient Romans gave to Jupiter, calling him Jupiter Hospes, because they considered him as the guardian of hospitality.

HOSPITIUM, Inx; a term peculiarly used, in our law-books, for an inn of court.

Hospitium is also used for a little convent, which the religious built for the reception of strangers and travellers of the same order, who had occasion to stay with them some time.

Most of these hospital, or inns, in time became fixed convents.

In the middle ages there seem to have been no inns or houses of entertainment for the reception of travellers; and this circumstance affords a proof that little intercourse bused between different nations. And as hospitality is a virtue of the first rank among people whose manners are simple, and who are seldom visited by strangers, it was considered at the period to which we now refer as a very important and indispensable virtue; and not as one of those virtues which men may practise or not, according to the temper of their minds, and the generosity of their hearts. Hospitality was enforced by statutes, and those who neglected this duty were liable to punishment. "Quicquum hospiti venienti lectum, aut focum negaverit, trium foldorum in latione multificavit, Leg. Burgund. tit. 38. § 1. Si quis homini aliquo pergenti in uicino manum venetaverit, seque lex extinguit solidos componet in publico," Capital. l. vii. § 82. The laws of the Slavi were still more rigorous; they ordained "that the moveables of an inhospitable person should be confiscated, and his house burnt." They were even so licentious for the entertainment of strangers, that they permitted the landlord to feed for the support of his guest. "Quod noctu furatus fueris, cras appone, hospitibus," Re- rimi Meclneburg. l. vii. a Mat. 30. Bedir. Lipp. 1751. p. 50. In consequence of these laws, or of that state of society
Proper hospitality made it proper to entice them, hospitality abounded while the intercourse among men was incon siderable, and secured the stranger a kind reception under every roof where he chose to take shelter. As the intercourse among men increased, that which was a pleasure became a burden, and the entertaining of travellers was converted into a branch of commerce.

Hostage was likewise formerly used for procuration, or visitation money. See Procuration.

Hospodar, the title borne by the prince of Walachia and Moldavia.

The Hospodars of Walachia and Moldavia receive the in vention of those principalities from the grand seigneur, by a vell, and a standard which he gives them.

They are sometimes deposed by him; though in other respects they have sovereign power within their states.

Hossain, a principal town of Coreyly, in Bengal; 50 miles N. of Moorshedabad.

Hossain, or Hoste, in Geog. a principal town of Corewally, in Bengal; 50 miles N. of Moorshedabad.

Hossainour, a town of Hindoostan, in Oude; 40 miles N.E. of Muscatapur.

Hossamally, a town of Hindoostan, in Guzerat; 25 miles S. of Amebad.

Hossaree, a town of Hindoostan, in Canara; 10 miles E. of Bareclore.

Hossein, or Longorossen, a town of Arabia, in the province of Oman, on the E. coast; 30 miles N.N.W. of Sohar. N. lat. 24° 40'.

Host, Hospes, which some will have thus called, quae hostium, or ostium peters; for ostium is anciently written with an aspirate; a term of mutual relation applied both to a person who lodges and entertains another, and to the person thus lodged.

Thus the innkeeper pays, he has a good hoft, in speaking of the traveller who lodges with him; and the travelled again says, he has a kind hoft, in speaking of his landlord. It must be observed, then, that it was the custom among the ancients, when any stranger asked for lodgings, for the master of the house, and the stranger, each of them to let a foot on each side of the threshold, and swear they would neither of them do any harm to the other. It was this ceremony that raised so much horror against those who violated the law or right of hospitality on either side; insomuch as they were looked on as perjured. Instead of hospes the ancient Latins called it hostis, as Cicero himself informs us; though, in course of time, hostis came to signify an enemy; so much was the notion of hospitality altered.

Host is also used by way of abbreviation for hostis, a victim, or sacrifice, offered to the Deity.

In this sense, hoft is more immediately understood of the person of the word incarnate, who was offered up a hoft, or hostia, to the Father on the crofs, for the sins of mankind.

Host, or Hoste, is chiefly used, in the Romish church, for the body of Jesus Christ, contained under the species of bread and wine, which is offered up every day, a new hoft, or sacrifice in the mass.

Pope Gregory IX. first decreed a bell to be rung, as the signal for the people to betake themselves to the adoration of the hoft.

The vessels wherein the hofts are kept is called the eibory; being a large kind of covered chalice.

Hostage, formed of hoft, and that of hospes, a person left as surety for the performance of the articles of a treaty.

When two enemies are on the point of concluding a treaty, or capitulation, it is frequent for them to give hostages on each side, as sureties for the execution of what is contained therein.

A hostage is either a principal, or an acciesary, according to the state of the cause. He is only an acciesary, when, for instance, a prince promises fidelity to another, and gives up his son, or some other great lord, to assure his engagement, without any farther stipulation. For here, if the prince fail of his word, the hostage is no ways accountable for it.

But the hostage becomes a principal, when it is expressly stipulated, that he shall be answerable for the event: for instance, if a city engage to surrender, in case it be not relieved in so many days, and to secure the engagement, give hostages, these hostages are what a surety is to a creditor for the debt of his principal. So that if the relief do not come, and yet the cities refuse to surrender, the hostages stand in their places, become principals, and are liable to be punished for the prevagination of those they are become sureties for.

A hostage given for another person becomes free when that person dies.

Hosptana, in Geography, a town of Itraia; 6 miles N. of Ravend.

Hostaun, a town of Bohemia, in the circle of Pilsen; 9 miles N.W. of Trzeitz.

Hoste, or l'Hoste, John, in Biography, who flourished in the former part of the seventeenth century, was born at Nancy, in Lorraine. He was some time professor of civil and canon law in the university of Pont-a-Mouffon; and afterwards occupied the mathematical chair. His talents and industry recommended him to the notice and favour of Henry, duke of Lorraine, who appointed him to the posts of intendant of fortifications, principal engineer, and counsellor of war. He was author of many valuable works connected with his profession, of which the following are the principal: "Le Sommaire et l'Usage de la Sphere Artificielle;" "Description et Usage des principaux Instrumentes de Geometrie;" "Du Cadran et Quarre." He died in the year 1674.

Hoste, or L'Hoste, Paul, was born at Pont-de-Veex, in France, in the year 1652. He entered into the order of the Jesuits in 1669, and afterwards took several voyages with the marquis D'Etretes and D'Enville, and the duke of Mortemart, whom he accompanied, for twelve years, in their naval expeditions. He distinguished himself by his great skill in mathematics, and became professor of those sciences at Toulon, where he died in 1709. He was author of 1. "Traites des Evolutions Navales," folio, 1697. 2. "Traites de Mathematique les plus necessaire a un Officier," 3 toms. 12mo. The treatise on naval evolutions was enlarged and reprinted in 1727; it is historical as well as didactic, and contains an account of the principal naval transactions during the last fifty years preceding the time of its first publication, illustrated with four hundred copper-plate engravings. Annexed to it is a treatise "On the Constructions of Ships." Moreci.

Hostea, in Botany, was discovered by professor Willdenow, in compliment to the highly meritorious Dr. Nicholas Thomas Hoft, author of a Synopsia Plantarum. Auctoris egerunt. octavo; and of a most superb work in three volumes, folio, with coloured plates in the style of Jacquin's publications, entitled Graminia Auctiorae. Professor Jacquin has called a plant Hostea, with the same intention, in his Hortus Scehembrinus. v. 1. 62. t. 114, which appears to us the Cornua pyramides of Linnaeus, notwithstanding the doubts and objections of Jacquin, and the disagreement of its fruit with...
HOSTEL, or Hotel, a French term, anciently signifying a house or dwelling-place.

It is now more commonly used for the palaces or houses of the king, princes, and great lords.

In this sense they say, the hotel de Condi, hotel de Condi, hotel de Louvre, &c.

The grand devet de l'Hotel was the first judge of the officers of the king's household; his jurisdiction was much like that of lord-highward of the household of the king of England.

The hotel de ville is what we call a town-house, or town-hall.

Hotel-dieu, a common name for the chief hospital for the reception of sick persons, in most of the cities of France. The Hotel de Mery is a hospital near Paris; of the same nature with Chelsea hospital.

HOSTEREN, in Geography, a small island in the N. sea, near the coast of Norway. N. lat. 60.

HOSTERLITZ, a town of Silesia, in the circle of Zennin; 12 miles N. E. of Zennin.

HOSTIA, Host, in Antiquity, a victim offered in sacrifice to a deity.

The word is formed from hostis, enemy; it being the custom to offer up a sacrificial before they joined battle, to render the gods propitious; or, after the battle was over, to give them thanks. Some choose to derive the word from hostis, q. d. ferio. Induce on this word remarks, that the name hostia was given to those sacrificial which they offered before they marched to attack an enemy; Antiquam, says he, ad hostem pergrans, in contradistinction from victima, which were properly those offered after the victory. Ovid seems to differ from otherwise, when he says,

"Victima quae eccidit dextra victorie, vocatur.
Hollitus a domitio hostia nomen habet."

As if the hostia might be slain by any priest, but the victim only by the hands of the victor. Fronton makes another distinction: according to him, victima was a grand oblation, and hostia a smaller and less considerable one.

HOSTILINA, in Mythology, a goddess adored among the Romans, and invoked particularly for the fertility of the earth.

HOSTILITY, the action of an enemy. During a truce, all hostilities are to cease on both sides; such a city stands neutral, and commits no hostilities on either side.

The word is Latin, hostilias, formed of the primitive hostis, which signifies enemy, and which anciently signified stranger, hobses.

HOSTILLERS, in our Old Writers, is used for innkeepers; and in some old books the word hostes is taken in the same sense. 3 Ed. III. cap. 2.

The word is French, hobses, of the same import.

HOSTIS, in Antiquity. See Hostis.

HOSTOMITZ, in Geography, a town of Bohemia, in the circle of Beroun; six miles S. E. of Beroun. N. lat. 49 51'. E. long. 14° 11'.

HOSTORP, a town of Sweden, in the province of Skone; 10 miles N. W. of Lund.

HOT-BATH. See Bath and Therme.

HOT-BED, in Gardening, a name given to a sort of bed contrived for the purpose of producing artificial heat, and the raising of different sorts of culinary and other vegetables and plants.

In this view these beds are mostly formed either of horse-dung or hawker's-dung, being raised two, three, or four feet high, and covered with garden-frames and glasses, &c. And in some cases the dung and bark are mixed or blended together.

It is chiefly by the aid of these beds that various tender plants, flowers, and fruits, are raised in perfection, which, without such artificial heat, could not possibly be produced or continued in this climate. By this means, likewise, vast numbers of seeds, which would otherwise remain years in the earth, and some never grow at all, are made to generate, form plants, continue their growth, and produce their flowers and fruits as in their native soils. And the cuttings and slips of many sorts of trees and shrubs, which would otherwise remain inactive and perish, are also made soon to emit root-fibres and flowers, and become plants in due time.

By this means, too, many valuable esculent plants, that succeed in the full ground at one time of the year or other, are brought to perfection much sooner than they could otherwise be obtained, as the cucumber, asparagus, peas, beans, kidney-beans, radishes, carrots, strawberries, and various salt herbs, and other plants, which grow in the open ground of the garden department.

And annual flowering plants, as well as those of the herbaceous and shrubby kinds, are also brought to more early perfection and flowering by them. They are therefore of great use in the practice of gardening, in numerous cases of forcing early productions.

Making Dung Hot-beds.—The proper situations for making these sorts of beds in are the forcing-ground, or other sheltered, warm, sunny exposures, either in or contiguous to the garden ground.

The hot-beds are sometimes made entirely on level grounds, and sometimes in a trench or oblong cavity formed in the ground, the width and length of the intended bed, and from twelve inches to a foot and a half deep or more; but for early work in the winter or spring seasons, they should be raised above ground, upon the level or rather elevated surface, that the bottom of the bed may stand dry, and not be liable to be chilled by wet, as, when made in this way in those seasons when the heat declines, both sides of the bed may be lined with hot dung quite to the bottom, so that the whole may have an equal benefit of the lining to revive its declining heat, which is essentially necessary during winter and spring, until the middle or latter end of May. But when hot-beds are made in trenches at an early season, where linings must be added to support a constant regular heat, all that part of the beds within the ground is deprived of the advantage of them. These beds are sometimes also enclosed by brick masonry, which is surrounded by hot dung on the outside. This is M-Phil's mode of early forcing.

With respect to the forms and dimensions of dung hot-beds, they should generally be those of long squares, ranging nearly half and wide, to any length that may be convenient; about four feet and a half in breadth, if to be covered with common garden-frames; and three and a half or four feet if for hand-glasses; raising them, if in winter, or early in spring, three or four feet or more in height, allowing for stuffing.
thing; as they will settle half a foot or more in the course of a week or two after making them.

The more early beds should be substantial, otherwise they will not support a durable uniform temperature of heat for continuing the plants in a regular free growth; which, by the aid of limbs, must be effected till the arrival of warm weather. Those made in winter should be three feet and a half in height at first, when first made; or if four, so much the better; in March a yard in height, in April the same, or two feet and a half; and in May two feet or a little more, as without due sub stance they never answer well.

These beds may be made for a one-light, a two-light, or even a three-light frame; and for two, three, or more, three-light frames in a range, according to circumstances and the nature of the forcing to be done.

Manner of Forming the Beds.—After properly marking them out, some of the longest and most flanny dung should be shaken along the bottom, to begin the bed with; then the long and short together as it comes to hand, finicking it evenly in every part, raking the sides perfectly upright, straight, and firm as possible; forming the corners also full and very firm, keeping the middle well filled with the bed dung; and, as the work advances, bearting each layer of dung evenly and firmly down with the dung fork; or, when it is very long, lofts, flanny dung, treading it in to settle every part equally; proceeding in this manner till the bed is arrived to its designed height, raking that part intended for frames two or three inches higher in the back or north side than in front, to give the greater scope to the glasses to the sun, finishing the top even in every part; and when the bed is thus raked, trimming up all the short dung remaining at last round the bed, laying it on the top ridge-ways along the middle, which may either then, or rather, if a strong bed, in a few days afterwards, when the bed has settled a little, be levelled, to make good all inequalities, and smooth the surface. After this let the frames, &c. on, and earth the bed as directed below. See Frame and Hand Glasses.

The hot-bed being thus formed, when of considerable substance, it may be advisable to defer the framing and earthing it finally for several days, or even a week or more according to the strength of the bed, until it is a little settled, and the first violent heat has subsided; as the heat will be very strong, and frequently of a burning nature, for the first week or two after it is made. It may, however, often be proper to set the frames and glasses on, to defend the beds from excessive rains or snow, as well as to draw up the heat sooner, to form the bed to a proper temperature for the reception of the mould, and seeds or plants. The upper ends of the lights should be raised a hand's breadth high, or be shewed so much down in dry weather, that the great beam arising from the bed may pass freely off; as in strong hot-beds neither the earth, feed, nor plants, should be put in till the fierce heat and violent beam have a little abated. Hot-beds of flender substance may, however, be framed, earthed, &c. as soon as made, as no great danger is to be apprehended from burning, and more particularly those for small frames, hand-glasses, &c.

Where, in this mode of forcing, there is an extensive range of substantial hot-beds, the placing of the frames on them before they are fixed for good, is often inconvenient; in which case it is proper to have mats, or dry long litter, ready to cover the tops in case of excessive rain or snow, which might chill and retard the beds greatly from becoming of a due temperature for the reception of the earth, &c. and sometimes occasion them to become of a burning description, when they otherwise would be of only a regular heat and temperature for the purposes for which they are designed.

But in hot-beds designed for strength and duration, it will, as soon as they are made, be proper to provide some sharp pointed sticks, two feet long, to thrust down into the middle of the beds in different parts, that by pulling them out daily, and feeling their lower parts, a judgment may be formed of the working and temperature of the beds, and when in a proper state for the reception of the mould and plants.

Where the hot-bed is therefore of good substance, and for the large frames, it is proper to let it remain some days to settle, before it is framed for good, because, notwithstanding all the care in making it, it will often settle unequally; and it should be levelled before it is earthed; in from about three to five, six, or eight days, according to the nature of the dung, or sub stance of the bed, it will have so far settled as to discover the inequalities, if any; when, if the frames and glasses were placed thereon, for the purposes above-mentioned, when the whole has settled, all the inequalities should be made even, by levelling the top, making the surface firm, and smoothing it off neatly with the back of the spade.

Then the frame and glasses should be put on for good, opening the lights a little at top to give vent to the steam and rank heat.

Mode of Earthing the Beds.—As strong substantial dung hot-beds, after being covered with the frames, &c. sometimes heat violently the first week or fortnight; when the earth is put in during the fierce heat, by confining that and steam till more closely it is in danger of being burned, and also of destroying the feed and roots of the plants, if any were sown or planted. When the earth is thus burnt by the heat of the dung, no seeds or plants can vegetate or thrive in it; it must therefore be taken out and replaced by fresh compost. Hot-beds of such consider able substance should of course be examined previously to mounding them, to ascertain the state of heat daily, by the ditches, and thrusting the hand into the dung. And when it is found of a due temperature, the mould should be put on. This is sometimes flown to be the case by the appearance of a frost of mullroom upon the more superficial parts.

But in flender hot-beds, as their heat is never so violent or durable, they may either be earthed as soon as made, or in two, three, or four days afterwards, as may be judged proper. In all cases care should, however, be taken that the beds do not lose any time for them to waste their heat ineffectually, without being earthed and properly prepared for the reception of the plants.

And for all sorts of hot-beds, the earth or mould should be rich, light, and of a dry quality, particularly for early work in winter and spring, and tender plants, such as cucumbers, melons, tender annuals, &c. as very moity earth rots such plants while young, binds too closely, and by its compactness confines the heat and steam, so as often to burn at bottom, and sear the roots of the plants. Some light mould should therefore always be in readiness in some airy shed, for two or three weeks before it is wanted for this use: See Compost.

In regard to the depth of earth or mould which is necessary to be applied over hot-beds, it must be different according to the purposes for which they are designed, as for fowling feed on, or the reception of plants, and the nature of the plants, or chiefly for planting pots in. In general, however, from about five or six, to ten or twelve inches, is the common depth. For fowling feeds to raise plants for transplantation, the depth of mould should be about six inches; and where they are to remain to acquire their full growth, not
H O T - B E D.

not less than from six to eight to ten or twelve inches in depth. If for the immediate reception of plants to remain, or for striking cuttings of any sort in, &c. from six to eight, ten, or more inches of mould will be necessary, regulating the whole in some proportion to the nature or growth of the plants, and the substance of the beds. Thus, cucumbers and melons, which are not only extensive growers, but produce large fruit that requires much nourishment, need a greater depth of mould than small salald-herbs, &c. which only stand in need of a slight covering.

In the humbefts of earthing the beds, every part of the dung within the frame should be carefully covered over, especially after the plants are come up, or any planted in them, that no steam may rise immediately from the dung upon them, and thereby prove injurious or destructive to them.

With regard to the fowing or planting of feeds or plants in hot-beds of strong substance, under frames, care should constantly be taken not to do it till the danger of burning is over, unless performed in pots, that may be removed up as occasion requires; and at any rate, it is always better to wait a day or two, than to endanger the plants; time should not, however, be lost when the bed is ready, as it is necessary always to have a lively heat at first, to promote a quick germination in the feeds, or to strike and let the plants forward, so as to allow a free growth at first when they appear at the surface of the beds.

And in the management of hot-beds after being fown or planted, it must often be different, according as the different plants may require. In general, however, after the feeds or plants have been put in, the glaffes are to be constantly continued until the middle of summer, when the weather is become settled and warm, particularly for all the tender kinds of plants; fresh air being admitted daily, at all opportunities, in mild weather, by raising the upper ends of the lights; or, if hand-glaffes, by propping up one fide, from about half an inch to two or three inches high, according to the heat and steam in the bed, and temperature of the outward air, shutting all clofe in due time towards evening, and keeping them clofe every night during the cold weather, covering the glaffes every night with mats until June, especially for the more tender sort of plants, flowers, &c.

As soon as the heat of the beds naturally declines or becomes of a weakly temperature, it must be renewed by adding fresh hot dung around the fides, which is called lining the bed, and is particularly necessary for all dung hot-beds, made any time in winter or spring, as already noticed. See Lining.

And sometimes a repetition of new linings is required three or four times, especially when the feed in winter, to continue them in an uniform heat; these linings should be made of the hottest dung, and be applied quite from the bottom to the top of the bed, and about fifteen or eighteen inches wide at bottom, drawing them into about a foot wide at top, raising them four or five inches up the frame to allow for settling, but not more; for the tops of the linings, when settled, should be but very little above the bottom of the frame, left their heat burn the earth adjoining to the frame within; and to prevent steam from rising too copiously from the linings, a stratam of earth should be laid on the top two inches thick, continuing it close up to the bottom of the frame, that no steam may rise that way; for the rank steam immediately from dung, without sift passing through a body of earth, is destructive to molt plants. As the linings settle down lower than the tops of the bed, more fresh dung should be added, in order to preserve them of a proper height.

Lining Bark Hot-beds.—These are such hot-beds as are formed of bark or tan, after having been used in tanks or pits, and which produces a regular, moderate, and steady durable heat. See Bark and Hot-bone.

But hot-beds of this kind always require to be made in proper bark-pits formed for the purpose of brick-work, or post and planking, to confine the tan in its proper situation and direction. See Bark-pit.

In cases where there are proper conveniences of pits, in which to make the hot-beds furnished with frames and glaffes suitable, they are superior in many cases to dung hot-beds, both in raising many early efulent productions, and various curious flowers to early bloom, as well as in the propagation and raising many sorts of tender exotics, from seeds, layers, cuttings, &c. In bark hot-beds early strawberries and melons may be raised, which, by the regular, moderate, and durable heat which they produce, are generally in great perfection at an early season; likewise, small early crops of drawer-peas and kidney-beans, &c. and of flowering plants, many sorts may be forced in great perfection of early bloom, both of the bulbous, tuberous, and fibrous-rooted kinds, such as hyacinths, dwarf-tulips, jonquils, narcissus, anemones, ranunculuses, pinks, and many other moderate growing kinds; also roes, and some other small ornamental flowering shrubs of different descriptions.

And bark hot-beds are also of great utility in hot-houses, flies, and forcing houses, as the principal and most proper, and effectual kind of beds for these different departments of the garden. See Bark-beds, and Hot-bone.

Kinds of forced Crops.—The particular sorts of crops usually raised in these hot-beds are those of cucumbers, melons, asparagus, strawberries, kidney-beans, peas, dwarf-peas, radishes, small salald-herbs, and lettuces. But various sorts of feed plants are raised and preferred in this way, such as cauliflowers, early cabbages, red cabbages, early celery-plants for pickling out, carrots, small white turnip-radishes, Dutch turnips, mint, tarragon, tansy, basil, capiciums, love-apples, coriander, purslane, early dwarf potatoes, and mushrooms in beds of peculiar sorts. But those for which these beds are more absolutely necessary, are all the firft fort, and bail, capicium, love-apple, and mushrooms amongst those of the second description. See Mushroom-bone.

Hot-beds, in Agriculture, a fort of earthly layer or stratam, under which horse and some other kinds of manure have been deposited in their more raw and imperfectly reduced conditions, by means of which a degree of heat is kept up for some length of time, and thereby vegetation brought forward, where the feafon or climate is not warm enough for effecting the purpose in a proper manner. This is a method of husbandry that can only be had recourse to in particular sorts of crops, such as those of potatoes and a few others, in which the sorts or other feeds are capable of being put in upon littery or other hot dung in the drills or rows, by means of which a kind of hot-bed is prepared for the promotion of their growth, and the extension of their knobly, tuberous, or other roots.

Hot-bed Culture, a term applied to that kind of cultivation which in some measure approaches to that which takes place on hot beds. See Hot-bed.

Hot-bone, in Gardening, a fort of garden erection, mostly formed of glass-work, in which a constant regular degree of artificial heat by fire and bark hot-beds is kept up and preserved.

The principal powers which assist in promoting the growth of vegetables, and which of course should be regarded in buildings of this nature, are those of heat, light, air, earth or foil, and water. The firft of these is commonly afforded by
by the consumption of some sort of material as fuel, in a narrow fire-place or furnace, the heat and smoke being conveyed in a winding horizontal flue or pipe, which serves as a chimney to the different parts. This has, likewise, been occasionally done by the application of steam alone, as well as in combination with fire. This is, however, too expensive a method to be generally employed. It may be afforded also by different materials in the state of fermentation, such as dung, litter, leaves, and various other vegetable products of little value but for manure. And in particular situations it may be effected by the sun, being preferred by proper contrivances, as in the patent hot-house lately invented by Mr. Anderdon, and described below. But though all these schemes may be occasionally had recourse to in particular cases, that by the consumption of fuel in furnaces and flues is the only practical method that can be generally adapted with benefit. As the principal difficulty is the regulation and retention of the temperature, so as to suit the different habits and degrees of heat that are requisite for the growth of the different plants; various plans have been had recourse to in these intentions; in the latter partly by having the house made in a great measure air-tight, and partly by the contrivance of an inner curtine, so as to be let down close under the glafs during the night-time, and thereby prevent the heated air of the house from being brought in contact with it, and from escaping in any great proportion in that way. This curtine has been lately contrived by Dr. Loudon. In the former, the heat is also chiefly regulated and kept at the proper height by means of this curtine, which, as it keeps up the due temperature, does not render it necessary to have the heat raised so much in the early part of the night, in order to avoid its getting too low towards the morning. For though the house be quite air-tight, as glafs from its porous nature is readily permeable by heat or cold, it must of necessity, in consequence of the affection of the heated air to the top of the house, be continually given out to the surrounding atmosphere by the roof and sides of all glassed houses of this description. It is indeed principally on this account that such houses as have their sides of glafs, are, without this sort of curtine, conducted with such trouble and difficulty.

Light is necessarily admitted by having the whole or a portion only of the roof of such houses; or all the roof and sides too, contriv'd with glafs, in frames that have the convenience of sliding at pleasure. It is of very great importance in these buildings also, that the light should fall upon the plants, at but a small distance from the glafs of their roofs, as by such means the plants are found to succeed in the most perfect manner.

Air is obviously included within such houses, but is capable of being excluded, and that which is fresh admitted either in the whole or only in part, so as to be intermixed with it, by means of proper openings or apertures formed in different parts, so as to be opened or closed as there may be occasion for the due growth of the plants.

Earthly matter or soil proper for this purpose may be provided by means of inclining a part of the surface of the ground within such houses, and putting it under a suitable state of preparation, as well as by depositing it after being properly prepared in pots or boxes made for the purpose, and which are capable of being put in any way that may be found beneficial for the plants or other things they may contain.

Water can readily be given in its state of fluidity to the plants or other crops simply by pouring it over the surface of the earth, or by the garden syrings, engine, and watering-pot, as rain; and by pouring it upon the heated flues or other parts of the house by which it is converted into vapour, it is applied as dew, in consequence of its being deposited in fine particles as it loses its heat.

Besides these, the removal of stagnant air in these sorts of houses is of much consequence, which may in some measure be effected by affording motion to the plants by the admission of the external air in gentle currents. But as this can only be properly attempted when the air from without is nearly of the same temperature as that of the hot-houses, it is plain that plants grown in such places can only have such admissions for a very small part of the year. This has led to different contrivances in order to remedy the defect, but those have hitherto been attended with but little success.

General Contrivation and Use.—The hot-house is used for procuring some sorts of fruits, such as the peach, the nectarine, the cherry, the fig, &c. also for the vine, the pineapple, and for raising and preferring various other sorts of tender exotics from the hot parts of the world. Each of these sorts of fine fruits requires something particular in the construction of the hot-house.

Those which are intended for the peach, nectarine, cherry, and fig, &c. are in general with great propriety in cold situations constructed against walls, being made with glafs on one side. But in climates that are less severe, such houses are formed of glafs on all the sides, having the trees so planted as to grow irregularly in the standard method, may be more beneficial as well as more ornamental.

For the forcing of vines, they may be of any kind of form as well as small or large, according to the feason at which the trees are to be brought into fruit. But a double-roofed house, with an inner roofing, is advised by some as the most proper for general crops, as well as the most cheap in its nature.

It is usual for pines to be raised at very great expense, in consequence of the quantities of tan, leaves, and other similar substances that are necessary, and which stand in need of such frequent renewal, and cause so much labour and trouble in removing and replacing the plants, &c. in their situations. These, with the uncertainty that is naturally attendant on forcing with materials under the state of fermentation, have deterred many from attempting this sort of culture. Lately, however, plans have been suggested and put in practice, which in a great measure obviate these inconveniences, as may be seen in the fection of a piery given in the plate for this purpose.

But in the general construction of these houses, a wall of eight or ten feet in height or more, is raised behind, with a low wall in front and both ends, on which is placed upright glafs-work, four, five, or six feet, and a sloping glass roof, extending from the top of the front to the back wall. Internal flues for fire-heat, in winter, are also contriv'd, and a capacious oblong or square pit in the bottom space, in which to have a constant bark-bed to furnish a continual regular heat at all seasons; so as in the whole to warm the inclosed internal air always to a certain proper high degree. Houses thus formed are molly used in raising pines.

But besides the above, these houses are of great utility in forwarding many sorts of choice or desirable hardy plants, flowers, and fruits to early perfection, which being transplanted into pots, and placed in them in winter, or early in spring, the constant heat thus produced forwards them to maturity two or three months or more before their natural season in the full ground, such as kidney-beans, strawberies, &c. also, many sorts of flowering plants, both annuals and perennials, of moderate growth, are forwarded to early bloom; and vines planted in the outside close to the front, the stem of each introduced through a small hole above, and
the internal branches trained up under the glass-work, produce grapes at an early period, as in May. In hot-houses, likewise, early cucumbers may be raised in good perfection; and the seeds, cuttings, slips, &c. of many curious tender plants forwarded exceedingly to their growth by plunging the pots containing them in the bark-beds of such houses.

**Situation and Form.**—These houses are mostly ranged lengthways, nearly east and west, that the glassings of the front and roof may have the full influence of the sun. This is the most convenient situation for common houses, either for pines or exotic plants.

But four houses of this sort, instead of being placed in this direction, have lately been ranged directly south and north, having a sloped roof to each side like the roof of a house; also to the front or south end; both sides and the south end being of glass. These houses are made from ten to twelve to fifteen or twenty feet wide, the length at pleasure; and from ten to twelve feet high in the middle; both sides fully head height; being formed by a brick wall all round, raised only two or three feet; and south end; but at the north end like the gable of a house. Upon the top of the side and south end walling is erected the framing for the glass-work, which is sometimes formed two or three feet upright, immediately on the top of the wall, having the sloped glass-work above; and sometimes wholly of a continued slope on both sides, immediately from the top of the side walls to that of the middle ridge. They are furnished either with one or two brick-pits; but if of any considerable width, generally with two ranging parallel, one under each slope of the top glass, separated by a two-foot path running along the middle of the house, and sometimes continued all round each pit, with flues ranged along against the inside walls; the whole terminating in an upright funnel or chimney at the north end of the building.

There are other hot-houses which are formed entirely on the square, having a ten or twelve-foot brick wall behind; that of the front, and both sides, only two or three feet high for the support of the glass-work, placed nearly upright almost the same height, and sloped above on both sides and front, which are wholly of glass. These are furnished within with bark-pits and flues, as in the other forts.

In particular cases they are likewise made semicircular, or entirely circular, being formed with a two or three-feet brick wall supporting the glass framing, which is continued quite round; having the brick-pit also circular, and flues carried all round the inside of the walling, terminating in a chimney on the northern side of the house. However, the fir forms are probably the best for general purposes.

**Dimensions.**—Hot-houses on these plans are made of different dimensions, according to the size of the plants they are designed to contain; but for common purposes they should be only of a moderate height, not exceeding ten or twelve to fourteen feet behind, and five or six in front; some are, however, built much more lofty behind, to admit of the taller growing exotics placed toward the back part, to grow up accordingly in a lofty stature; but the above are best adapted to the culture of pines, and other moderate growing plants, as well as for forcing in; as very lofty houses require a greater force of heat, and by the glassings being so high, the plants receive less benefit from the sun, and are apt to draw up too fast into long slender leaves and stems, as they naturally tend towards the glassings. Where the top glassings are at a moderate distance from the plants, they receive the benefit of the sun's heat more fully, which is essential in winter, and become more flaky at bottom, and assume a more robust and firm growth, particularly the pine-apple, and are thereby more capable of producing large fruit in the season.

**Construing the Flues.**—After having determined on the dimensions as to length and width, the foundations of the house should be set out accordingly of brick work, allowing due width at bottom to support the flues a foot wide, wholly on the brick basis; detached an inch or two from the main walls; then setting back off the back or north wall a brick and a half or two bricks thick, and the front and end walls nine inches, carrying up the back wall from ten to fourteen feet high; but those of the front and ends only from about two feet to a yard; taking care in carrying up the walls to allow a proper space for a door-way, at one or both ends, towards the back part; setting off also the furnace or fireplace of the flues in the bottom foundation, towards one end of the back wall behind, formed alto of brickwork, made to communicate with the lowermost flue within. But when of great length, as forty feet or more, a fire-place at each end may be necessary; or, if more convenient, may have them in the back part of the end walls, or both in the middle way of the back wall; each communicating with a separate range of flues; in either case, forming them wholly on the outside of the walls, about twelve or fourteen inches wide in the clear, but more in lengthways inward; the inner end terminating in a funnel to communicate internally with the flues, fixing an iron-barred grate at bottom to support the fuel; calculated for coal, wood, peat, turf, &c. An ash-hole should be made underneath. The mouth or fuel-door should be about ten or twelve inches square, having an iron frame and door fixed to shut with an iron latch as close as possible. The whole furnace should be raised sixteen or eighteen inches in the clear, finishing the top archways. Then continue carrying up the walls of the building regularly, and on the inside erect the flues close along the walls.

It is sometimes advantageous to have the flues a little detached from the walls, one, two, or three inches, that, by being thus distinct, the heat may arise more from both sides, which will be an advantage in more effectually diffusing the whole heat internally in the house; as, when they are attached close to the walls, a very considerable portion of the heat is inefficiently lost in the part of the wall behind. In contriving the flues, they should be continued along the front and both ends, in one range at least, in this order. But it is better if they are raised as high as the outward front and end walls, in one or two ranges, one over the other. On the tops of these may be placed pots of many small plants, both of the exotic and forcing kinds, with much convenience.

Thus proceed in the construction of the flues, making them generally about a foot wide in the whole, including six or eight inches in the clear, formed with a brick work, on edge; the first lower flue should communicate with the furnace or fire-place without and be raised a little above it, to promote the draught of heat more freely, continuing it along above the internal level of the floor of the back alley or walk of the house the above width, and three bricks, on edge, deep, returning it in two or three ranges over one another, next the back wall, and in one or two along the ends, and front wall as the height may admit; each return two bricks, an edge deep, and tiled or bricked over. In the beginning of the first bottom flue a sliding iron regulator may be fixed, to use occasionally, in admitting more or less heat, being careful that the brick-work of each flue is closely jointed with the belt fort of mortar for that purpose, and well pointed within, that no smoke may break out; having each return closely covered with broad square paving tiles on the brickwork; covering the uppermost flues also with broad, thick, flat tiles the whole width, all very closely laid, and joined in mortar. The uppermost or last range of flues should terminate in an upright vent or chimney at one end of the back wall;
HOT-HOUSE.

wall; and where there are two separate sets of flues, there should be a chimney at each end. An iron slider in the termination of the last flue next the chimney may also be provided, to confine the heat more or less on particular occasions, as may be found necessary.

But sometimes, in very wide houses, in erecting the flues, to make all possible advantage of the fire-heat, one or more spare flues, for occasional use, is continued round the bark-pit, carried up against the surrounding wall, but detached an inch or two, to form a vacuum for the heat to come up more beneficially, and that, by having vent, it may not dry the tan of the bark-bed too much; and in the beginning a sliding iron regulator may be fixed, either to admit or exclude the heat, as expedient; so that the smoke, by running through a larger extent, may expend its heat wholly in the flues before it be discharged at the chimney. Great care must be taken that neither the fire-place nor flues be carried too near any of the wood-work of the buildings.

Bark-pit.—After this work is done proceed to set out the cavity for the bark-pit, first allowing a space next the flues for an alley or walk, eighteen inches or two feet all round, and then in the middle space form the pit for the bark-bed six or seven feet wide, the length in proportion to that of the house, and a yard or more deep; inclosing it by a surrounding wall. It may either be sunk at bottom a little in the ground, raising thereof above by means of the parapet wall; or if there is danger of wet below, it should be raised mostly above the general surface. The surrounding wall should be nine inches, but a brick wide wall is often made to do, especially for that part which forms the parapet above ground. It should be coped all round with a timber plate or kirk, framed and mortised together, which effectually secures the brick-work in its proper situation.

The bottom of the pit should be levelled and well rammed, and if paved with any coarse material, it is an advantage in preferring the bark. And the path or alley round the pit must be neatly paved with brick or tufc, as may be more convenient.

Glafs-work.—The glafs part for inclining the whole should consist of a close-continued range of glafs-fashes all along the front, both ends and roof, quite up to the back wall; each fash being a yard, or three feet six inches wide; and for the support of which, framings of timber must be erected in the brick-walling, conformable to the width and length of the fashes, the whole being neatly fixed.

And for the reception of the perpendicular glafs in the front and ends, a substantial timber plate must be placed along the top of the front and end walls, upon which should be erected uprights, at proper distances, framed to a plate or crown-piece above, of sufficient height to raise the whole front head high, both ends corresponding with the front and back; a plate of timber being also framed to the back wall above, to receive the floping bars from the frame-work in front; proper grooves being formed in the front plates below and above, to receive the ends of the perpendicular fashes, sliding close against the outside of the uprights all the way along the front, or they may be contrived for only every other flue, to slide one on the side of the other, but the former is the better method.

And from the top of the upright framing in front should be carried substantial cross-bars or bearers, floping to the back wall, where they are framed at both ends to the wood-work or plates, at regular distances, to receive and support the floping glafs fashes of the roof, when placed close together upon the cross bars or rafters, and generally ranging in two or more tiers, sliding one over the other, of sufficient length together to reach quite from the top of the upright framing in front, to the top of the back wall. The cross bars should be grooved lengthways above, to carry off wet falling between the frames of the floping lights; making the upper end of the tier of glafs fashes close up to the plate in the wall behind, running under a proper coping of wood or lead, fixed along above close to the wall, and lapped down of due width to cover, and shoot off the wet sufficiently from the upper termination of the top fashes. Some wide houses have, exclusive of the main slope sliding glafs fashes, a shorter upper tier of glafs fixed; the upper ends being secured under a coping as above, and the lower ends lapping over the top ends of the upper sliding tier, and this over that below in the same manner, to shoot the wet clear over each upper end or termination; likewise along the under outer edge of the top plate, or crown piece in front, may be a small channel to receive the water from the floping glafs fashes, and convey it to one or both ends without running down upon the upright fashes, being careful that the top part behind be well framed and secured, water-tight, and the top of the back wall finished a little higher than the glafs, with a neat coping the whole length of the building.

And the bars of wood which support the glafs should be neatly formed, and made neither very broad nor thick to intercept the rays of the sun. Those however, at top, should be strong enough to support the glafs without bending under them. In wide houses, uprights are arranged within, at proper distancies, to support the cross rafters more perfectly than could otherwise be the case.

Glazing.—But in respect to the glafs work in the floping fashes, the panes of glafs should be laid in putty, with the ends lapping over each other about half an inch, the vacancies of which are, in some, closed up at bottom with putty, others leave each lapping of the panes open, in order for the air to enter moderately, and that the rancid vapours arising from the fermentation of the bark-bed, &c. within, may thereby be kept in constant motion, without condening much, and also that such as condense against the glafs may discharge themselves at those places without dropping upon the plants. The upright fashes in front may either be glazed as above, or the panes laid in lead work; being very careful to have the glazing well performed, and proof against any wet that may happen to beat against them. The doors should have the upper parts fashed and glazed to correspond with the other glafs-work of the house.

Painting.—And on the inside, the walls should be plastered, pargeted, and white-washed; and all the wood-work within and without, painted white in oil colour. Some, however, have the back wall painted or coloured rather dark.

Shelves.—Ranges of narrow shelves for pots of small plants may be erected where most convenient, some behind over the flues, a single range near the top glafs towards the back part, supported either by brackets lappend from the cross bars above, or by uprights erected on the parapet wall of the bark-pit. A range or two of narrow ones may also be placed occasionally along both ends above the flues where there is a necessity for a very great number.

In wide houses, where the cross bars or bearers of the floping or top glafs fashes appear to want support, some neat uprights, either of wood or iron, may be erected upon the bark-bed wall, at convenient distances, and high enough to reach the bearers above. This is a neat mode of affording them support.

And on the outside, behind, should be erected a close shed, the whole length, or at least a small covered shed over each fire-place with a door to flut, for the convenience of attending...
attending the fires; but the former is much the bell, as it will serve to defend the back of the house from the outward air, and to flow fuel for the general use of them, also for garden tools, and all garden utensils when not in use, to preserve them from the weather; as well as to lay portions of earth in occasionally, to have it dry, for particular purposes in winter and early spring, as in forcing frames, &c.

Sometimes hot-houses are furnished with top covers, to draw over the glass sashes occasionally, in time of severe frosts and storms; and sometimes by flight sliding shutters, fitted to the width of the separate sashes; but these are inconvenient, and require considerable time and trouble in their application. At other times they are formed of painted canvas, on long poles or rollers, fixed lengthways along the tops of the houses just above the upper ends of the top sashes, which, by means of lines and pulleys, are readily let down and rolled up as there may be occasion.

In the plate of Hot-houses, at fig. 1. and 2. are contained the front elevation and ground plan of an improved hot-house, which has been found to answer well in practice in different instances.

At fig. 3. is shewn the section of a hot-house for pines, in which the objections arising from the expense and risk attending their culture on the old plan are chiefly obviated. It is the invention of Mr. London. In this, A, A, A, are the smoke flues; B, the air flue; C, a large vacuity of heated air; D, the rubble stone vacuity; E, the walk in the centre; F, earth in which the plants grow; G, feeding and air tubes; H, the inner roofing; I, the surface of the ground. See London's Treatise on Hot-houses.

A plan for another kind of improved hot-house has been suggested by Dr. James Anderdon, for which he has taken out a patent. It produces its effects chiefly by the heat of the sun, without the aid of flues, tan-bark, or steam. This improvement extends to every part of a hot-house; and the advantages of such hot-houses are, according to the statement the doctor has given, very considerable. They are,

1st That "in every kind of temperature, if the works are to be erected new, from the foundation, few cafes can occur, in which they may not be so placed, as that the whole heat required may be obtained without occasioning the expenditure of one shilling for fuel; but in the most unfavourable cafes that can occur, the expenditure of fuel will not amount to one-tenth part of what is now universally employed for producing similar effects."

2d. That "in a vineyard, for example, where the grapes are not meant to be forced farther than to ripen from the middle of June to the end of July, as the season may be, no fuel will, in any cafe, be required, the whole effect being produced by the sun alone."

3d. That "where the grapes are to ripen in April or May, some artificial heat will be wanted; but the quantity of fuel, even in this case, will be so inconsiderable, that in a house which produces, on an average of years, under ordinary good management, not less than ten thousand full-sized bunches of grapes, and fifteen hundred pots of strawberries, or other such plants, the consumption of fuel will not exceed half a London childrent of coals, and fo in proportion for those of a larger extent."

4th. That "in the pinery and stove, the expenditure of fuel will be diminished in a proportionate degree; while, at the same time, the use of bark (or of steam, as a substitute for the heat of tan) will be entirely dispensed with; which, in many situations, will be the saving of much expense."

5th. That "these savings of expenditure will be effected not only without any detriment to the pines and other

...
fame time, and of course, of forcing most sorts of common vegetables, as well as growing vines, pines, and melons, each in their suitable climates, at little trouble or expense. A surface plan of it is given in the annexed plate, in which A, the cover of the excavation, comprizing the furnace; B, the air register, which serves to form the different temperatures; C, the air and steam tubes, by which the heated air is admitted from the vacuum formed by the rubble stone, as well as by the steam afforded by pouring in water, &c. In the position of this pit in the same place, A represents the smoke flue; B, the air flue; C, the chimney; D, the supports or the rubble vault; E, the rubble cavity; F, the earth and the plants; G, the inner roofing rolled up; H, the damper; I, the furnace hole; K, the cover of the flame; L, the surface of the ground, &c. There are many advantages derived from this mode of construction, as those of saving labour, expense, and littering the garden ground; and by slight alterations it will be found to answer cheaply for the business of forcing vines. See Loudon on Hot-houses.

**Form of Succession House.**—This sort of house should be contrived with erect glass frames in front, and sloping fashes at top, with a door for entrance, and an alley or walk next the back wall; or, what is better, continued round the back-pit. And where joined to the end of the hot-house, it may be divided from it by a sliding glass partition, having a separate furnace and flues, as the young pine plants do not at all times require the same degree of fire-heat as the older pines. The dimensions must vary according to circumstances, and the number of plants. See **Greeen-house**.

**Hot-house Plants.** are all such of the tender, exotic, or other kinds, as require this sort of house for their growth, protection, and preservation, in this climate. This description of plants is very extensive, and of many different kinds. See **Stone Plants**.

**Hot-houses, in the Salt Works,** the place where they dry the salt after it is taken out of the boiling pan. In the Cheshire salt-works, this is situated between the furnace and the flues of the chimney which conveys up the smoke. Along the floor of this room there run two flues, nearly in a horizontal direction. From the furnace, after this course along the floor, they rise perpendicularly. In these, the flame and smoke running along, heat the room by the way.

**Hot-houses, or Horihouses,** a sort of factitious, or compound fires, made of a third part of any coal, pit, sea, or charcoal, mixed with two-thirds of loam.

These ingredients are to be made up into balls, moistened with a little urine, round, or in any other form, at pleasure, and exposed to the air till thoroughly dry; then may they be burnt in the most orderly fire imaginable, affording a glowing, regular, and constant heat, for seven or eight hours, without standing. This mixture is also used in some parts to blacken the impetuous devouring of the fire, and keep coals from consuming too fast.

**Hot Springs,** in Geology. A great part of the writers on thermal waters have ascribed their heat to subterranean fires, heated deep in the earth, and have supposed that the waters of hot and warm springs were all alike boiling hot, until by their passage through different masses of cool strata, they were reduced to the temperature at which they issue. Mr. Farey's recent examination and report on Derbyshire, vol. i. shews, that the hot or warm springs at Buxton, Matlock Bath, Stoney-Middleton, &c. are situated on or near the principal faults or vertical derangements of strata in these districts, and the probability that fāsile, brought in contact with toads, in the faces of these faults, excites the fermentation, or decomposition, which develops the constant heat of these curious springs. See **MINERAL WATERS**.

**Hot Wall**, in Gardening, a term applied to a range or extent of brick or stone walling, fronted with glass-work, so as to incline a space of several feet in width, constructed with internal fire-flues, &c. designed for forcing fruit-trees to early production. It consists of two parts, the flues and furnace in the wall; and the contrivance of a covering of canvas or netting to protect the trees.

**Situation of this nature are mostly ranged lengthways, east and west, to the front the sun; having the south side, or, that exposed to the sun, covered by a frame-work of glass, the whole length and height, including a space of moderate width, as four, five, six, or eight feet for one row of trees behind, trained in the wall-tree order, and extended from twenty to thirty, to forty, fifty, or a hundred feet in length; or of greater width, as ten, twelve, or fifteen feet, in the forcing-house manner, to admit of a range of trained trees behind, and others of lower growth forward; and, in either having internal flues for fire-heat in the main-wall, and continued round along towards the front glass, or sometimes ranged longitudinally along the middle space. Some hot-walls have likewise the front inclosure of glass-work, of sufficient width to admit of forming an internal pit, from four to five or six feet in width, the length of the erection; in which to make a bark-bed, or sometimes a dung hot-bed, or occasionally dung below and bark above, to affix, in conjunction with the fire-heat of the fires, in warming the internal air of them.

And in either method, a border of good mellow, loamy, or other fertile earth of proper width, is formed against the main-wall, in which to plant the trees. Where there is no bark-bed, the whole bottom space is formed with good earth, having a narrow inclosure of glass, four, five, or six feet, to have only a range of trees next the wall, trained as wall-trees, or espaliers; or sometimes made wider, to have wall-trees behind trained to the height of the wall, and others trained, in lower growth, in the internal space forward, either in the espalier manner, or as small dwarf-standards, or sometimes as horizontal dwarfs. See **DWARF TREES**.

When these are made of wide dimensions, either to admit of a bark-pit, or to have the whole bottom space of earth set with trees against the wall, and others planted forward between these and the glass, they may properly be considered as forcing-houses.

But in proper hot-walls, as such have narrow inclosures of glass from four to five or six feet in width, containing only one range of trees, may they be trained towards the wall upon a trellis-work, where there is a range of flues immediately next the wall; but where all the flues are ranged forward, the trees may be trained close to the wall. See **FORCING-frames**.

The flues in these walls should be formed in such a way as to distribute the heat equally over the wall, which is easily effected. The fronts of them should be made at least a brick in thickness, to preserve the heat more effectually. The most proper furnace for this use is that fold by Mr. Cook in London, and connected with a damper, which is very useful. The covering of canvas, gauze, or netting of the small kind, should be fixed to the wall top, by means of small rafters, and to the border, about three feet from the roots of the trees; the roller for containing this covering being fastened to the bottom parts of these rafters. By this means, and the use of cords and pulleys, such coverings can easily be drawn up to the top of the wall, or be rolled down, as there may be occasion. This covering should never be neglected.
in such walls, as it is of vast utility in preserving the heat, as well as in preventing the effects of destructive fruits and chilly dews at particular leasons. See BARK-pit, and PIT.

HOTAMBÉLA, in Zoology, the name of a species of insect found in the East Indies, of a greyish-yellow colour, and very rank smell.

HOTCH, in Agriculture, a term provincially applied to a bad job of any sort of work, or to such bargains as do not turn out well.

HOTCH-POT, in Law, signifies a mixture or blending of lands, given in marriage, with other lands in fee accruing by descent. Thus, a man feized of thirty acres of land in fee, hath two daughters, and gives with one of them ten acres in frank-marriage, and dies seized of the other twenty. If now, the that is thus married will have any part of the twenty acres, the muft put her lands given in frank-marriage in hotch-pot, that is, the muft refuse to take the folc profits of the ten acres, but suffer them to be mingled with the other twenty, so that an equal division may be made of the whole thirty between her and her father. Thus, for her ten acres she will be entitled to fifteen. Coke on Litt.

This was left to the choice of the donee in frank-marriage; and if she did not chufe to put her lands into hotch-pot, she was preferred to be sufficiently provided for, and the rest of the inheritance was divided among her other fitters. The law of hotch-pot took place only, when the other lands descending from the ancestor were fee-simple; for if they defended in tail, the donee in frank-marriage was entitled to her share, without bringing the lands so given into hotch-pot. (Litt. § 274.) And the reason is, because lands descending in fee-simple are distributed by the policy of law, for the maintenance of all the daughters; and if one has a sufficient provision out of the fame inheritance, equal to the rest, it is not reasonable that she fhould have more; but lands descending in tail are not distributed by the operation of the law, but by the designation of the giver, per formam doni, however unequal the distribution may be.

Alfo no lands, but fuch as are given in frank-marriage, shall be brought into hotch-pot; for no others are looked upon in law as given for the advancement of the woman, or by way of marriage-portion. (Litt. 275.) But gifts in frank-marriage having fallen into dispute, it would have been needful to mention the law of hotch-pot, if this method of division had not been revived and copied by the statute for distribution of personal chattes. See FRANK-MARRIAGE, and CUSTOM of London.

HOTCH-POTCH, or Hodge-Podge, from the French bache en poche, or, according to Camden, bache en pot, i.e. boiled in a pot, primarily denotes a Flemih medley dish, made of hfe cut in pieces, and fobbed with herbs, roots, &c.

HOTMAN, Francis, in Biography, a French civilian, was born at Paris in 1542; at the age of fifteen he was sent to study the law at Orleans, where his progrifes was fo rapid, that within three years he received the doctor's degree. He read lectures at Paris, but quitting the religion in which he was educated, and embracing the Protestant faith, he went to Switzerland, from whence he removed to Straflburg, where he obtained a professorship of the civil law. He afterwards engaged in the service of the king of Navarre, and took two journeys into Germany, for the purpose of obtaining succours from the Protestant princes. On his return, he removed to Valence, where his law-lectures revived the credit of the university; after which he was induced to accept a profefloration at Bourges; this he soon resigned, to partake in the councils of the heads of the Protestant party at Orleans; but at the time of the infamous massacre of St. Bartho-

lorow he retired to Bafl, where he died, in the year 1595. His works were published, in 1599, in three volumes folio. He was learned and profound jurif, an eloquent historian, an able politician, and an ingenious man. His works confift, for the most part, of tracts relative to the civil law, and to the Roman history and constitution. Bayle.

HOTOM, or Koton, in Geography, a town of Little-Bucharia; 230 miles S.E. of Cashgar. N. lat. 37° 42'. E. long. 80°.

HOTTORE, a town of Bengal; 22 miles E.S.E. of Dacca.

HOTOWACZYN, a town of Lithuania, in the patinate of Torki; 16 miles E. of Grodno.

HOTTENPLOZ, a town of Moravia, in the circle of Perau, inhabited in Sileia; 12 miles N.N.E. of Jagerdorf.

HOTTENTOT CHERRY, in Botany. See Cassine.

HOTTENTOTS, Country of, in Geography, a large territory of Africa, and part of Caffraria, bounded on the N. by countries unknown, and on the S.E., S., and W. by the sea. The coast is mountainous, and abounds in capes and bays. The whole country, distinguished by this appellation, is inhabited by different tribes of Hottentots, governed by various chieftains, who have no fixed residence, but live in huts or portable houfes, and remove their kraals, or villages, whichever the paffure fails to supply their cattle, or upon the death of an inhabitant. Ever since the establishment of the Dutch in the southern part of Africa, they have been separated and differed from the neighborhood of the Cape of Good Hope; and thoce who from ill usage and oppofition have been removed to a confiderable distance, or to regions that have been inaccessible to their purfuits, have maintained some separate eftablihments, and retained, in a degree, their primitive habits and manners. The Hottentots are divided from the Caffres or Kaffers by the Great Fih river. The dilipation and character of these people have been much misrepresented; and we are indebted principally to Mr. Barrow for a just account of them; who has rectified the mistakes and confirmed the more favorable representations of modern writers. Dr. Sparrman has given the following account of the Hottentots. With regard to their perfonas, he fays, they are as tall as most Europeans, and if they are, in general, less corpulent, this is owing to their being more fcented in their food, and to their not being acculturated to hard labour. But that they have fmall hands and feet compared with the other parts of their bodys has been remarked by no one before, and may, perhaps, be regarded as a characteristic mark of this nation. The root of the nofe is for the most part very low, by which means the distance of the eyes from each other appears to be greater than in Europeans. The tip of the nofe likewise is very flat. The iris is fearely ever of a light colour, but has a dark brown cut, which sometimes approaches to black. Their fkin is of a yellowish-brown hue, resembling that of an European who has the jaundice in a high degree; however, their colour is not in the least observable in the whites of the eyes. One does not find fuch thick lips among the Hottentots as among their neighbours the Negroes, the Caffres, and the Mozambique. Their mouths are of a middling fize, and almost always furnifhed with a feft of the fweeth teeth that can be feen, and taken together with the reft of their features, as well as their shape, carriage, and every motion, in short their "tout ensemble," indicate health and content, or at leat an air of "fans fouci." At the fame time, this careless men discovers marks of alacrity and resolution; qualities which the Hottentots can occasionally exhibit. Their heads one would suppo-
HOTTENTOT.

The Hottentots, with their skins thus be smeared with grease and foot, and Bucku-powders, are in a great measure defended from the influence of the air, and may in a manner reckon themselves dreeded. In other respects both men and women appear naked, excepting that a trifling covering always conceals part of their bodies. The covering of the men consists of a bag or purse made of skin, hanging quite open, and only fastened by a small part of its upper end to a narrow belt, so that it is an imperfect covering; and when the wearer of it is in motion, it is no concealment at all. This purse is called Jackall, from the name of the animal, of whose skin it is prepared, with the hairy side turned outward. As another covering which decency requires the men to use, we may also consider two leather straps, generally hanging from the bottom of the cline of the back down upon the thighs, each of them being in the form of an isosceles triangle, with the points or upper ends fastened to the belt already mentioned, and with their bases, about three fingers broad, hanging carelessly down. These straps make a kind of rattling noise, as the Hottentot runs along, and probably by fanning him, produce an agreeable coolness. Among the Hottentots, the fair sex appear to be the most modelled, for the females cover themselves much more scrupulously than the men, using for this purpose two, and very often three coverings, made of a prepared and well-greased skin, which are fastened round their bodies with a thong, resembling the aprons of European females. The outermost is always the largest, measuring in breadth from about six to 12 inches. This is frequently adorned with glass-beads strung in different figures, thus indicating among the unpolished Hottentots not only a regard to neatness and decorum, but powers of invention, and a disposition to set off their natural advantages. The outermost apron reaches about half way down the thighs, and is chiefly intended for ornament. The middle one is about a third or one-half less, and is regarded by them as an additional entrenchment of modesty, when their gala garment is laid aside. The third, or innermost, about the size of one's hand, is said to be useful at certain periods, which are much less troublesome to the fair sex here than in Europe. All these aprons, however, and even those which are decorated with beads, are not less befmeared and greasy than their bodies. The garment worn by the Hottentots for covering their bodies is a sheep-skin, with the woolly side turned inwards; this pelle, or else a cloak made of some smaller fur, is tied forwards over the breast, and worn loose, or wrapped round them, as far as below the knees, according to the state of the weather. In general, the Hottentots do not burden themselves with many changes of their cloaks, or "krofts," (as they call them in broken Dutch), but are content with one, which serves them both for clothing and bedding; and in this they lie on the bare ground, covered with this krofs or karofs. The cloak, or karof, of the women differs little from that of the men, except that their's has a little hood or pouch, with the hairy side inwards, in which they carry their infants, to which they now and then throw the breast over their shoulders. The men have seldom any peculiar covering on their heads. The women likewise go bare-headed: but when they use any covering, it is a cap in form of a truncated cone, made of some animal's stomach, and as black as foot, mixed with fat, can make it. Over this they sometimes wear a kind of oval wreath, or a crown made of buffalo's hide, with the brown hair upwards, about four fingers high, and surrounding the head so as to reach a little way down upon the forehead and the neck behind. The rims of this wreath, above and below, are ornamented with a row of small shells of the Cyprea kind, in number about 30, and placed quite close, so that their beautiful white enamel, together with their mouths, is turned outwards. Between these two rows of shells, there are others disposed as their fancy fuggels. The ears of the Hottentots are never adorned with any pendant or ornament, any more than the nose, according to the custom of other savages: the latter, however, is sometimes marked with a black streak of foot, or a large spot of red lead; and on high days and holidays they put some of the latter on their cheeks. The necks of the men are bare; but those of the women are decked with an ornament, held in high estimation, which consists of a thong of undressed leather, upon which are strung eight or ten shells. These shells are commonly sold for not less than a sheep's-piece, as it is said they are procured nowhere else than on the moat distant coast of Caffaria. On their arms and legs they wear rings, and this ornament is used by both sexes. These rings are made of leather straps, formed in a circular shape. This ornament has given occasion to the almost universally received report, that the Hottentots wrap guts about their legs, in order to eat them occasionally. The men wear from one to five or six of these rings on their arms, but seldom any on their legs. These rings are of various thicknesses; and to the matrons of higher rank, who have them both on their arms and legs, they give great trouble both in the preparation and use of them. Kings of iron and copper, and especially of brahs, of the size of a goose-quill, are considered as more handfome and more valuable than those of leather. The girls are not allowed to wear any rings till they are marriageable.
HOTTENTOTS.

muriable. The Hottentots seldom wear any shoes; those in occasional use are made of undressed leather, with the hairy side outwards; which leather undergoes no other preparation besides that of being beaten and moistened with cow-dung and some kind of grease. The Hottentots who live within the boundaries of the Dutch colonies seldom make use of any weapons; here and there they furnish themselves with javelins, as a defence against the wolves; these are called "Haffagais." The habits of the Hottentots are like their dress, adapted to the wandering pastoral life. They fearedly merit any other name than that of huts. In a Hottentot kraal or village the huts are built exactly alike, so that the equality of fortune and happiness among these people excludes mutual jealousy and envy. Some of these huts are circular, others of an oblong shape, resembling a rural bee-hive or a vault. The ground plot is from 18 to 24 feet in diameter: the highest of them are 10 low, that even in the centre of the hut, a middle-sized man cannot stand upright. The door is barely three feet high; but the Hottentot finds no difficulty in leaping and crawling on all fours, as he is always more inclined to lie down than to stand. The fireplace is in the middle of each hut, and therefore when they sit they rather lie in a circle round the fire, the whole company equally enjoying the benefit of its warmth. The door is the only part of the hut that lets in day-light; it is the only outlet for smoke. The frame of the arched roof is composed of slender rods and sprays of trees, which, previously bent into a proper form, are laid, parallel to each other, or cross-wise; and these are strengthened by binding others round them in a circular form with withies. These withies, as well as the rods themselves, are taken chiefly from the "Cliffortia conoides," which grows plentifully in this country near the rivers. Large mats are then laid very neatly over this lattice-work, so as perfectly to cover the whole. The aperture of the door is closed when occasion requires, with a skin fitted to it, or a piece of matting. The mats are made of cane or reed, fastened together with fowces or catgut, or some kind of packthread procured from the Europeans. When a Hottentot has a mind to take down his house and remove it, he lays all his mats, skins, and sprays, on the back of his cattle. The order or distribution of these tents in a kraal or clan is most frequently in the form of a circle, with the doors inwards; by these means a kind of yard or court is formed, where the cattle are kept at night. The milk, as soon as it is taken from the cow, is put to other milk which is curdled, and is kept in a leather sack; of this the hairy side, being considered as the cleaner, is turned inwards; so that the milk is never drank while it is sweet. In certain northern districts, such as Roggevelo, or Bokkevelo, where the land is, as it is called, Karrow (which sec), or dry and parched, the Hottentots, as well as the colonials, are shepherds.

From the account of the Hottentots given by Mr. Barrow it appears, that the neglect or opprobrium with which they have been treated by the colonists has contributed to corrupt and degrade them. Having first held out the irresistible charm which spiritious liquors and tobacco are found to poffe, among all people in a rude state of society, they took the advantage of exchangefng these pernicious poisons for the only means the natives enjoyed of subsisting themselves and their families; and instead of instructing and encouraging a race of men of willing and intelligent mind to renew the means of subsistence of which they had deprived them, they imported at a vast expense a number of Malay slaves, not more expert and much less to be depended on than the Hottentots, to whom, indeed, they even preferred the stupid negroes of Mozambique and Madagascar. That they are capable of infliction and improvement, both mental and moral, appears from the laudable establishment of the Hermitudus or Morevarian missionaries, who, by the protection afforded them under the British government, and its liberality, through general Dundas, in enabling them to enlarge their territory, had succeeded so far, in the object of their mission, as to bring together into one society not fewer, at the time of the evacuation of the colony, than 600 poor Hottentots; whom they not only instructed in the principles of the Christian religion, but by example as well as by precept taught to feel, that their value in society was in proportion to the benefit they were able to render to that society, by their labour and moral conduct. On the contrary, when they experienced a treatment less favourable than that of the meanest slaves, and were employed with a view merely to the benefit of those who had possession of their country, and were neither paid, clothed, nor fed, they exhibited on the same spot a scene of filth and wretchedness; they became a nuisance to the town, and of course it became necessary to disband them. Sir James Craig bears honourable testimony to the disposition and conduct of those Hot- tentots whom he formed into a corps. He represents them as contented and grateful, as intelligent and docile; no more addicted to drunkenness than our own people, nor invincibly disposed to rove and abandon the service assigned them. By degrees they became cleanly in their persons; the practice of blemirthing themselves with grease being entirely left off; and they frequently washed themselves in a rivulet, where they could have in view no other object but cleanliness.

Other missionaries, says Mr. Barrow, but of different societies, have lately proceeded to very distant parts of the colony, and some even much beyond it, both among the Kaffers to the eastward, and the Bogjeftam Hottentots to the northward; the latter they represent as a docile and tractable people, inexpressibly grateful to their benefactors; but they say, the Kaffers are a volatile race, extremely good humoured, and ridiculing all their attempts to convert them to Christianity. A Hottentot, says the same ingenious writer, among the many good qualities he possesses, has one which he is master of in an eminent degree; that is, a rigid adherence to truth. When accused of a crime of which he has been guilty, with native simplicity he always states the fact as it happened; but at the same time he is always ready with a justification of what he has done. From lying and stealing, the predominant and inefearable vices of the condition of slavery, the Hottentots may be considered as exempt. "In the whole course of my travels, and in the midst of the numerous attendants of this nation, with which I was continually surrounded, I can with safety declare that I never was robbed nor deceived by any of them." Of the severity of the treatment which these poor people received from the savage bowers of the country, we have many instances on record. We shall content ourselves with mentioning only one. A young Hottentot woman, with a child in her arms, was found lying stretched on the ground in a most deplorable condition; she had been cut from head to foot with one of those infernal whips made of the hide of a rhinoceros or fea-cow, known by the name of "Sambocs," in such a barbarous and unmerciful manner, that there was fearfully a spot on her whole body free from laceres; nor had the sides of the little infant, in clinging to its mother, escaped the strokes of the brutal monster. For several days after she was taken care of, there were little hopes of her recovery; though by means of a good constitution and tender treatment she did afterwards recover. And what does the reader suppose could have been the atrocious crime that demanded such chastisement? The only crime alleged against her was the attempt to follow her husband, who was among the number of those
HOT

ef his countrymen that had determined to throw themselves upon the protection of the English. A Hottentot is capable of forming attachments; with a readiness to acknowledge, he poffeffes the mind to feel the force of a benevolent action. "I never found," says Mr. Barrow, "that any little act of kindness or attention was thrown away upon a Hottentot; but on the contrary, I have frequently had occasion to remark the joy that sparkled on his countenance, whenever an opportunity occurred to enable him to discharge his debt of gratitude. I give full credit to all that Monfieur le Vaillant has laid with regard to the fidelity and attachment he experienced from this race of men; of whom the natural character and disposition seem to approach nearer to that of the Hindus than of any other nation.

Dr. Sparrman mentions a tribe of Hottentots, called "Bohimeen," or "Bohoimeen," who live round about Camdebo and Sneuwurgh, who are sworn enemies to the pastoral life, and who live on hunting and plunder. Their weapons are poisoned arrows, which, shot out of a small bow, will fly to the distance of 200 paces, and will hit a mark with a tolerable degree of certainty at the distance of 50 or even 100 paces. From this distance they can by stealth, as it were, kill the game they hunt for food, as well as their foes, and even fo large and tremendous a beast as the lion. Their bows are hardly a yard long, and about an inch thick in the middle, and very much pointed at both ends. The strings of the bows are fine, or a kind of hemp, or the inner bark of some vegetable. The arrows are a foot and a half long, made of reed, armed with a highly polished bone five or six inches long. At the distance of an inch or two from the tip of this bone, a piece of quill is bound very fast with fines, so that the arrow may not be easily drawn out of the flesh, and thus the poison inimicats itself and infects the wound. Their quivers are two feet long, and four inches in diameter. Besides a dozen of arrows, every quiver contains a slender hone of sand-flone for whetting the iron head, and a brush for laying on the poison. The poison is taken from several different kinds of serpents, and the more venomous they are, the better. The dwellings of these foes to a pastoral life are generally more agreeable than their manners. Like the wild beasts, bushes and clefts in rocks by turns serve them instead of hovels; and some of them are said to be so far worse than beasts, that their soil has been found close to their habitations. Many of them are entirely naked; and others cover their bodies with such skins of animals as they are able to procure. As ignorant of agriculture as apes and monkeys, like them they are obliged to wander about over hills and dales after certain wild roots, berries, and plants, which they eat raw. Their tables are sometimes covered with the larvae of insects, snakes, and spiders. The capture of slaves from this race of men is easily effected. For this purpose, several farmers, who are in want of servants, join together, and take a journey to that part of the country where the Bohimeen live. They themselves, as well as their Lago-Hottentots, or such Bohimeen as have been caught some time before, and have been trained up to fidelity in their service, endeavey to spy out where the wild Bohimeen have their haunts, which is best discovered by the smoke of their fires. They are found in societies from 10 to 50 and 100. The farmers in a dark night set upon them, notwithstanding their numbers, with fix or eight people, having previously stationed themselves at some distance round about the kraal. They then give the alarm by firing a gun or two. The favages are thus terrified; some of them make their escape by flight; others are stupid and timorous, and suffer themselves to be captured. These are treated at first kindly, and plentifully fed with various kinds of game; supplied with tobacco, and induced to accompany the colonist to his place of abode. Their luxurious feasts of meat and fat are then exchanged for butter milk, frumenty, and hasty-pudding. With this change of fare, and a corresponding alteration of usage, they very sensibly feel the hardship of their condition, and make every effort in their power to escape.

The language of the Hottentots is said to be a composition of strange and disagreeable sounds, resembling rather the noise of irritated turkeys, the chattering of magpies, hooping of owls, than human sound or articulation, and depending on extraordinary vibrations, infections, and chafings of the tongue against the palate; and therefore it is no wonder that it should be understood by few, and that the knowledge of it can scarcely be acquired by persons of any other nation. As to their religion, it does not appear that they poffefs any, or that till of late any pains have been taken by their invaders and conquerors to afford them any instruction. Addicted to magic, they have among them abundance of witches and conjurers, and under bodily disorders they run to them for relief; and as their wizards employ both internal and external remedies, they are sometimes successful, but they more frequently fall in administering efficacious remedies. Diflinitc, as they are said to be, of any religious principles, they seem to have some ideas of a future state. Some have said that they worship a genus of insects called "Mantis," and others have affirmed that they pay a kind of adoration to the moon; but these reports have not been duly authenticated. See Paterson's Narrative of four Journeys into the Country of the Hottentots, &c. 4to. 1780. Barrow's Travels in Africa, vol. I. and II. See BOSHOOGAS, CAFFERRA, KAFFERS, KOU- SIS. See also CAPE OF GOOD HOPE.

HOTTENTOT Holland, a district of Southern Africa, which is a continuation of what is called the Sand Down, being a large tract of country lying between the Table bay, and bay Fafle. Most of it is uninhabitable, on account of a white sand blown up by the S.E. winds in very large ridges. There are, however, many thorns dispersed in different parts. It is the principal place whence they procure their fire-wood at the Cape. This territory is situated on the N.E. side of bay Fafle, and surrounded on three sides by lofty mountains; but open to the S.W. where the bay is in view. The soil is not so good for vines as most other places on this side of the mountains, being wet and marshy; but it produces an excellent corn. Here is one of the most difficult passes into the country, called "Hottentot Holland's Klof;" Klof or kloof denoting a narrow pass through the mountains. This high chain of mountains terminates the Cape rhinus, and at a few miles to the southward of the Klof it forms the eastern boundary of the extensive bay Fafle. This Klof is a narrow road cut through the hill, the summit of which appears to be nearly of a height with the Table land. The chain of mountains, commencing at cape Fafle, or the Hang-Lip, extends to the N.W. for nearly 300 miles; and from 20 to 30 miles from the sea. Several other branches from this chain extend to the interior parts of the country.

HOTTERRE, in Biography, born in Italy of French parents, was an excellent performer on the flute, and published an elementary work on that instrument that was much esteemed. He likewise published another work, entitled "L'Art de Preluder," the art of preluding.

There was a Mad. Hoterre, about the year 1740, who played well on the violin.

HOTTINGER, John Henry, was born at Zurich, in Switzerland, in the year 1620. His love of learning was 10
A very beautiful variety of this, with flowers of a deep rosy colour, was discovered near Kelmars in Northamptonshire by the late Mr. Hanbury, F.L.S.

It appears to us that the three other species mentioned by Willdenow are at best very doubtful. *H. indica*, a plant concerning which the most intelligent botanists have always had doubts, because of its habit, is made into a new genus under the name of *Limnophila* by Mr. R. Brown, *Prod. v. 1. 442*. We are unacquainted with the *ferrata* of Willdenow, or the *jesselufora* of Vahl; but by their descriptions the former at least seems to be a *Limnophila*, and probably the latter also.

HOTTTS, or HUTTS, pouces, and round balls of leather stuffed or tied on the sharp ends of fighting-cocks' spurs, to keep them from hurting one another in sparring or breathing themselves.

HOTY, in Geography, a town of Sweden, 21 miles W. of Carlecrina.

HOTZEMPLLOTZ, a town of Moravia, in the province of Blekingen; 2 miles N. of Trappau. N. lat. 50° 12'. E. long. 17° 35'.

HOU, a village of Egypt, on the left bank of the Nile, situated upon the uncinium, on which, as it is said, the ancient city of *Diospolis Parva* was built. (See Diospolis.) Rubbish, large bricks, and stones still larger, the remains of a dike, and an arcade, which forms an entrance to a subterraneous conduit, are the sole traces now remaining of the ancient works; 28 miles S. of Girgë. N. lat. 26° 2'. E. long. 31° 27'.

HOVA, a town of Sweden, in the province of Blekingen; 18 miles N. of Mariestad.

HOUAC, or HOUAT, an island in the English channel, about eight miles in circumference, defended by a fort; seven miles N.E. of Belle-Ile; N. lat. 47° 24'. W. long. 2° 52'.

HOUAL, or OUALO, a kingdom of Africa, situated on the banks of the Senegal, and on the coast of the Atlantic, 90 miles from E. to W., and 18 from N. to S. The soil is rich and fertile, producing in the greatest abundance maize, rice, indigo, tobacco, and cotton; the meadows feed a great number of cattle, large and small, while the flet is excellent; game is plentiful; birds are numerous and various; and the forests abound with palm-trees. The king of the country affames the title of "brak" or emperor; and was formerly very powerful, but of late is reduced to a low state, being frequently in want of millet for his support. When he is occasionally roused from his natural indolence, he assembles his courtiers, travels with them through the villages of his kingdom, eats the provisions which he can find; drives away the cattle; and exploits the owners to public sale.

HOUARD DE LA MOTHE, ANTONY, in Biography, a law antiquary, was born at Dieppe in 1725, and died at Abbeville in 1803. He was member of the Academy of Inscriptions, and an associate of the National Institute. His works are, 1. "Anciennes Lois des François, conservées dans les Coûtures Angloises," two vols. 410. 2. "Traité sur les Coûtures Anglo-Normandes, &c." four vols. 410.

HOVAREIN, in Geography, a town of the desert of Syria; 70 miles S.W. of Palmyra.

HOUBIGANT, CHARLES FRANCIS, in Biography, was born at Paris in 1686, was educated for the church, and became a priest of the Oratory. He distingushed himself for his profound knowledge of the Hebrew scriptures, which he translated into the Latin language with notes, published at Paris in 4 vols. folio 1753. He died in 1783. He was author of many other pieces, among which are "A Dictionary,
HOV

Dictionary, French and Hebrew," 8vo.; "Examination of the Pfarler of the Capuchins;" and "A Translation of bishop Sherlock's Sermons."

HOUCHONG, in Geography, a town of Meckley; 18 miles W. of Monypour.

HOUDAIN, a town of France, in the department of the Isteis of Cahis, and chief place of a canton, in the distric of Bethune; six miles S. of Bethune. The place contains 1060, and the canton 13,665 inhabitants, on a terri-ory of 220 kilometres, in 31 communes.

HOUDAIN, a town of France, in the department of the Seine and Oise, and chief place of a canton, in the distric of Mantes; 10 miles S. of Mantes. The place contains 1700, and the canton 12,392 inhabitants, on a territory of 232½ kilometres, in 31 communes.

HOUDAN, a small island on the North sea, near the coast of Norway. N. lat. 61° 40'.

HOVE, in Rural Economy, a term employed to denote the riting or swarming which sometimes takes place in chees, soon after they are made, in consequence of their taking on a flight degree of fermentation. The chief remedy in this case is the frequent turning of such cheeses in order to get them dry as expediently as possible. See Cheese and Dairying.

The term is likewise applied to the peculiar swelling in neat cattle and sheep, which proceeds from the feeding too greedily upon some sort of luxuriant green food, such as red clover, &c. See Hove.

Hove, in Geography, a town of Norway, in the diocese of Dronthom; 25 miles N.W. of Dronthom.

HOUEILLES, a town of France, in the department of the Lot and Garonne, and chief place of a canton, in the distric of Nercé; seven miles S. of Caletel-jaloux. The place contains 607, and the canton 4001 inhabitants, on a territory of 335 kilometres, in nine communes.

HOVEL, a town of Welfallia, in the bishopric of Paderborn; six miles N.W. of Lippring.

HOVR, in Rural Economy, the name of a kind of field or low building, which has some part of it constantly open below; but which is covered above. It is useful for young animals of the horse, neat cattle and sheep kinds to run into, as there may be occasion, for protection, during the stormy winter months.

HOVELLING, in Architecture, is a method of working up the fides of a chimney, and covering the top with tiles or bricks, set up in a pyramidal form, so that the smoke may escape below the current, when the wind makes over the chimney, or against any one fide of it. This is used to prevent the inconvenience arising from adjoining buildings higher than the chimney, or from its being in the eddy of any very lofty building, or in the vicinity of high trees: the covered fide muft in this cafe be kept towards the building which occafions the inconvenience.

HOVEN, in Rural Economy, a term applied to a peculiar fort of dilution or swelling taking place in the stomachs of neat cattle, sheep, and some other animals, in confequence of the sudden extrication of air, proceeding from the decomposition of green succulent food, which they have consumed too greedily and in too large quantities; such, for instance, as red clover, fog, or rank-grafs, &c. See Clover.

In this cafe, the chief remedy is evidently the dicharge of the confined air from the stomachs of the animal; which in flight affections may be often accomplished by the ufe of such fubfiances as have a tendency to retard or ftop the progres of the fermentative process, or to force off the flatus. Much benefit in thole intentions has been ob-tained from the giving of large does of prepared ammonia in mixture with some sort of spiritsuous liquor; and other fimilar remedies.

This affection has been suppofed, in an able paper in the twenty-ninth volume of Young's Annals, to principally pro-ceed from the ditention of the first stomach of the animals by the carbonic acid gas or fixed air that is difengaged from such tender juicy grafses, by their decomposition; the after ditcharge of it by the gullet being prevented by some fort of contraction occurring about the upper orifice of the stomach. It is added that the dangerous and frequently fatal effects that succeed the dilution are not to be ascribed to the air, or juices of the fermented grafs, acting as poisons upon the stomachs, for moderate quantities of either of them produce no bad effects; besides, the rete-rate experienced of the grazer has clearly fhewn, that cattle, in many infances, are immediately relieved and preferved by the properly flabbing them with a fharp-pointed knife, and letting the air escape in that way. It is, of course, concluded, that cattle may be faved with certainty, if the air be drawn off in due time, without injuring the stomachs or bowels. This is fuggefted as capable of being done with facility, by passing a flexible tube through the gullet into the stomachs. A tube of iron wire is advised as the most proper for the purpose, which has about one-fifteenth of an inch diameter, and formed by twifiting it round a smooth iron rod three-eighths of an inch in diameter; being afterwards covered with smooth leather. That end of the tube which is to be put into the stomachs, should have a brafs pipe of the fame fize, or rather larger, and two inches in length, firmly fastened to it, and pierced with large holes in fufficient number. In order to prevent the too much bending of the tube in the mouth or gullet in passing it down, an iron wire one-eighth of an inch in diameter, and of equal length with the tube, should be introduced into it; being withdrawn upon the tube entering the stomachs. It is found, that the space from the fore teeth, to the bottom of the firfl stomach of a large fized ox, is about fix feet; and a tube five feet nine inches in length has been paffed into the gullet of a living ox. A proper tube fhould confequently be fix feet in length to fucceed perfectly in all cafes. When the tube has been thus introduced it may remain for any length of time, as it does not inconvenience the breathing of the animal. By means of this tube, moft part of the elatic and condensed air may be dicharged from the stomachs, and where neceffary, ardent spirits, or any other fluid proper for checking fermentation, be thrown through it into the stomachs. In this way, the air is not only more certainly dicharged than by the practice of flabbing, but the danger which it caufes is obviated; this danger does not arise from much of the irritation of the wound, as the airy, and other contents of the stomachs infalinating themselves into the cavity of the belly, betwixt the containing parts and the bowels, and thereby creating fuch a flate of inflammation as may prove fatal to the animal.

This tube is equally applicable to sheep, when properly adapted in fize; and not lefs beneficial in the removal of the affection. It is perfectly fimple, and readily confructed by any common workman. Such tubes are however fold, ready for ufe, in London and other places.

Wooden tubes, somewhat of this nature, have been con-trived, and brought forward under the encouragement of the Society of Arts, by Mr. Eager, for the purpose of removing this fort of dilution in the stomachs of animals. They confist of knobs of wood firmly attached to portions of cane of different lengths, for fuiting different forts of animals, representations of which may be seen in the annexed
It is directed by the inventor, that such beasts as are hoven, or swollen, should be laid hold of by a person by the cowtail and one horn, while with one hand an affiant firmly secures the tongue, and with the other passes the cane quite down into the stomach. Care should be had, not to let the animal get the knob of the tube between his grinders. Some dilution is generally afforded to the tube about the entrance of the stomach, which requires a little additional force in passing it; as soon as a fetid smell is found to be discharged, and the size of the body of the animal to be diminished, nothing further is requisite, as nature will effect the rest. The success of this method has been fully confirmed by different flock-farmers.

The common practice of attempting the removal of this affection by the making an incision or puncture by means of a penknife between the short ribs, and fixing a pipe of some sort in it to afford passage to the confined air, securing the whole by adhesive plasters from the effects of the atmosphere, is generally the result of real necessity, but often liable to be attended with fatal consequences, from the want of knowledge, or inexperience of the person who performs the operation. In order to succeed, it should be done on the left side, about the mid-way between the short ribs and the hip-bone, a long slender knife being employed for the purpose, and thrust to the depth of from four to five inches. The operation is sometimes denominated parruching, and should be always carefully executed.

Only remedies have likewise been had recourse to in the view of removing these sorts of swellings in the stomachs of animals; such as olive oil, and butter, or lard, melted and blended together, but they can seldom be much depended upon, though affected to produce relief in a speedy manner by some.

It is a good method to prevent the disease taking place as much as possible, by properly managing the flock in first turning them upon such luxuriant pastures. This should be done, when they are the least pressed by hunger, in order that they may be the fomnest fattished with food; and when there is the least dew upon the grasses. It is also a good practice, in this view, to only let the animals remain a short time at once upon such pastures; and some advise their being frequently driven about in them; though much injury must necessarily be done to the grass in this way. See Clover.

HOVEDEN, Roger de, in Biography, an English historian, who flourished in the reign of Henry II. was born at York. Having received an education suitable to the purpose, he became a professor of theology at Oxford. He was likewise a lawyer, and is said to have served the king in the capacity of chaplain, and also in other confidential offices. It was not till the death of Henry that he applied himself particularly to the composition of English history. He wrote in the Latin language, commencing his annals with the year 731, the period at which Bede finishes, and coming down to the third year of John, A.D. 1201. His work was printed at London in 1595, in Sir Henry Savil's "Collection of ancient English Historians," and at Frankfort in 1601. Of so much authority was it that Edward I. caused strict search to be made in all the libraries for copies of it, in order to ascertain the homage due to the crown of Scotland.

order of James, who commanded the commissioners to in¬
itial Dr. Parker, bishop of Oxford, in his room. Twenty-five
of the fellows refused to sign a submission to their new pre¬
dent, who, on that account, were, with Dr. Hough, expelled
the college, and declared incapable of being admitted to any
eclesiastical dignity or benefice. In the following year, the
prince of Orange's declaration was received in England, and
the king, with the hope of regaining the allegiance of the
clergy, thought it prudent to recede from his illegal and
arbitrary proceedings. An order was accordingly passed to
reconcile Magdalen college to its rights; and Dr. Hough was
replaced in his precentorship by a commissary for that pur¬
pose, directed by the king himself to the visitor. After the
revolution, Dr. Hough was nominated by king William to the
bishops' of Oxford, with which he was allowed to hold
the precentorship in commendam; in 1699 he was translated
from the see of Oxford to that of Lichfield and Coventry;
and in 1715 he was offered the archbishopric of Canterbury,
which, through diffidence in himself, he declined. In 1717
he was raised to the see of Woreceler; and, notwithstanding
he was then 67 years of age, he prejided over Woreceler
25 years, constantly refiding in his diocese, and diluting
with fidelity and zeal all the episcopal functions. He died
in 1743, without pain or sickness, but quite exhausted, full
of days and honour. He was a very munificent prelate, and
expended on his episcopal palaces upwards of £2000. His
private benefactions were very extensive, and his hospitality
such as became his station as a father of his people. Dioq.
Brit.

Hough, in Animals, is the name of the bending or ply of
the hind leg, which also comprises the part behind but oppo¬
site to the ply, usually denominated the back. This point or
part, in the horse, should be full, and not too crooked,
in order to constitute a well formed leg.

To Hough, or cut the houghs, is to hamstring, or to dis¬
able by cutting the sinews of the ham.

Hough, Hounds, is a hard, round swelling, or tumour,
growing upon the tip or elbow of the hough.

It generally proceeds from some stroke or bruise; and if
neglected till the swelling becomes hard, like glue, it proves difficult to cure.

Hough, in Nautical Affairs, is a name for the square head
of some forts of barges, thore, for instance, which are used
for carrying goods on the Thames, at London.

Houliéres, Antoniette du Liger de la Garde, des, in Biography, is a distinguished French poetess, was born
at Paris in 168. Her talents for writing French vers were first excited and cultivated by the president Henaut.
She married Lafon feigneur des Houliéres, soon after which she was arrested at Brimelles by order of the Spanish govern¬
ment, and carried as a prisoner of state to the castle of Wil¬
verden, from thence she was released through the artifice of her husband. She came to Paris, and attracted round her a
circle of admirers and men of wit. Becoming a widow she fell into indigent circumstances. At length the obtained
a small pension, and faulted herself with study; and acquired
the knowledge of the Latin, Italian, and Spanish languages,
the best authors in which she read with facility. She died
in 1694. Her poems were collected in two volumes in
1724, and reprinted in 1747, in two volumes 12mo. They
co-operate with idylls, eclogues, odes, epigrams, and the tragedy of Genferie. The idylls are accounted the best compo¬
sitions of the chas in the French language. She has been
charged with gross plagiarism.

Houliéres. See HOLLIERUS.

Houma, in Geography, a town of Asiatic Turkey, in
the province of Natolia; 21 miles S.E. of Kara-hifer.

Houmiri, in Botany, Aublet. Guian. v. i. 56d. t. 225.
(Houmiri; Jull. 455.) Red-gum tree, or Red wood, of
Guiana. See MYRODENDRUM.

Houn, in Geography, a town of Africa, in Pezzan; 10
miles S. of Wadan.

Houna, a cape and village of Scotland, on the N.
coast of the county of Caithness; two miles W. of Dun¬
canby Head. N. lat. 58° 33'. W. long. 2° 57'.

Hounds may be distinguished, with regard to the manner
of their hunting, into such as find out and pursue the game
by sight, and the quickness and Swiftness of their motion;
which kind are the game-bounds, or greyhound, and grey-bound.
Greyhound, canis venatici, a hunting-dog. See Dog.

The species of scenting-dogs may be divided further;
itself, of course so-called, and blood-hounds; each whereof
admits of some diversities.

1. As to bounds, simply thus called, those which are all
one colour, as white, black, &c. are most valued; then
those spotted with red; the white with black ears, and a
black spot at the letting on of the tail, are generally
commended the best for compelling a kennel, and are of the
best scent and contation; those spotted with dun are less
prized, as usually wanting courage and boldness. The black¬
tanned, or all brown-coloured, or all white, the true tal¬
bots, are best for the firing or line; and the grizzled,
whether mixed or unmixed, if their hairs are flagged, are
usually the best runners. There should always be a couple
of these in the pack. Follow bounds are of good scent, and
hardy, not fearing the water; they keep the chase well,
without change; but are not so swift as the white; they
love the hunt above any other chase, having little on
the hare, &c. whereas they are not so fit for private
gentlemen; besides that, they are apt to run at tame beasts.
The dun bounds are of a more general use, being fit for
all chances. Their sagacity and fidelity in knowing and
flicking to their master's voice and horn, and to none else,
are much admired; they also understand each other, and
know which are babbles, which barks, &c. They are of
different sizes and qualities in the several countries, &c.
Mountainous and woodland parts breed a tall heavy fort,
called fox-hounds; moderate foils, where the champain and
covert share pretty equally, produce a middle-sized hound
of a nimble make. The ancient laid a greater fire on colour than the moderns, with whom it is a kind of fixed
opinion, that the colour of a good hound, or a good horse,
is unimportant.

The marks of a good and fair hound are to be of a middle
proportion, rather long than round, the nostrils wide, back
bowed, fillets great, launchers large, ham straight, tail big
near the roots, and the rett flender to the end, the leg big,
the sole dry, and claws large. See Dog.

The legs of a good fox-hound, says Mr. Daniel in his
"Rural Sports," should be straight as arrows; his feet
round, and not too large; his shoulders should lie back; his
bead rather wide than narrow; his chest deep; his back
broad; his neck thin; his head small; his tail thick and
bouncy; and if he carries it well, this circumstance will add
to his comeliness. Although a small head is mentioned as
one of the requisites of a fox-hound, this is to be understood
merely in its relation to beauty: for as to goodnefs, large-
headed hounds are in no respect inferior. The middle-sized
hounds are reckoned the strongest and best able to endure
fatigue. With regard to their shape, it is pre-emined that
they must all agree; and in order to exhibit a good appear¬
ance, they should be nearly of a size; if they appear of the
same
fame family it will be an addition, and if they are also hand-
some, they are deemed perfect as far as appearance is con-
cerned. It is of great importance in the shape of a hound
that it should exhibit a perfect symmetry: for if this be not
the case, he will neither run fast nor bear hard work; much
speed is required, and he should possess adequate strength.
A preposition will always occur in favour of that fort of
hound to which the sportmen have been most accustomed:
those who have usually hunted with the sharp-nosed,
will hardly allow a large-headed hound to be a fox-hound,
although both are equally so. Speed and beauty are the
chief excellencies of the former; whilst flatness and tender-
ness of nose in hunting characterize the latter. Very good
sport may be had with unsound hounds, where a great dif-
fERENCE in size and look is apparent, but a gentleman, anxi-
ous that his hounds should be complete, will not be satisfied
with such a pack; hounds should run well together, and this
cannot so well be attained as by uniting as early as possible,
those of the same fort, size, and shape. Packs consisting
of various kinds of hounds seldom run well together, although
they may frequently kill their fox; but it is the "style" of
killing which constitutes celebrity among sportmen. The
great excellence in a pack of fox-hounds is the "head" they
carry, considered in a collective body: they go fault in propor-
tion to the excellence of their noses and the head they carry,
and that pack may be said to go the most first, which can run
ten miles the fonnd; notwithstanding the hounds separately,
may not be so speedy, as many others. Some hounds creep
through the fame han, instead of topping the fence, and follow
one another in a string, as true, as a team of cart-horses. Mr.
Beckford, with coincidences and neatness, has described in
what manner they ought to be 
like the horses of the Sun,
all arrayed." Five and twenty couple of hounds are sufficient
at any time to be taken into the field, as being a match for
any fox, sapping them readily, and their speed nearly equal.
Too many hounds always do more mischief than service.
When packs are very extensive, the hounds are fond of suf-
ficiently hunted to be good. Where many hounds are kept,
either a large pack must be taken out, or a great number of
hounds be left behind: in the first case, too many hounds in
the field will probably spoil the diversion, and, secondly,
hounds long idle, always get out of wind, and not unfre-
fently become riotous. Forty couple of hunting hounds
will admit of hunting three times a week, twenty-five couple
being the usual allotment for the field. Hounds to be steady
must be confantly hunted: young ones in particular should
never be left at home while able to hunt: the lame, the old,
those low in fleh, and such as idleness cannot injure, may be
suffered to remain quiet. Hounds that are meant to run well
together, should never have too many old hounds amongst
them; five or six feasons generally destroying their speed.

The breeding of hounds is an object of great importance.
In respect of the breed of hounds, no country equals
our own; and it is remarkable, that the hounds procured
from England should degenerate in another climate. In
order to preserve this superiority, the size, shape, colour,
conformation, and natural disposition, as well as the inmens
of the nose, the flatness and method of hunting of the dog,
from which the breed is taken, should be duly considered.

Nothing is more essential to the having a good pack of
hounds, than a proper care of the whelps, and of the par-
ents from which they are to be bred.

The bitches, in particular, should be carefully chosen,
and should be such as are the strongest and best proportioned;
they must also have large ribs and flanks.

The best feason for the coupling of hounds is in January,
February, or March; for then they will litter in a good
time of the year, that is, in spring; so that they will be
fit to enter in due course, without loss of time, or of the
season; for if bitches litter in winter, it is very difficult
to bring up the whelps, the cold killing them if there is
not great care taken of them. If possible, have no whelps
later than April, as late puppies seldom thrive. Of the
early ones five or six should be kept: of the late ones,
ot more than half the number.

The dogs that line the bitches must not be above five
years old; for if they are older than this, the young ones
will be dull and heavy. Care should be taken to have
a proper dog ready the first time of the bitch's going proud;
for it is affirmed by many, who say they have experience
for it, that whatever kind of dog lines a bitch the first
time, there will be one puppy at half in all her succeeding
litters that will have some resemblance of him.

On no account breed from a hound that is not fit, that
is not tender-nosed, or that is either a babler or a skitter.
Babling is one of the worst faults of which a hound can
be guilty; and skitting hounds, where game is plentiful,
are always changing, and occasion the loss of more foxes
than they kill. It is the judicious crosf that renders the
pack complete: the imperfection on one side may be rec-
circled on the other, and if this be attended to, and a
cross hit found, purify it. The breeding from young dog-
hounds after the first season, who have beauty and goodness
to recommend them, to see what whelps they get, is a
proper trial. Never put an old dog to an old bitch, and
take care that those from which you breed be in good
health. In breeding, the best bitches should be sent to
the best dogs, wherever they may be; and thus those who
breed only a few hounds may have a good pack, whilst
those who breed many, (if at the same time they under-
stand the business,) reduce it to a certainty.

The first litter of puppies that a bitch brings, are never
effomed so good as the second or third. When a bitch
has been lined, and grows big with whelps, she is not to be
suffered to hunt among the pack, nor to take any other
violent exercise; for that would endanger her carry-
ning her whelps; she should be kept up and fed well, and a
good place should be provided for her to litter in.

As soon as she has littered, those which are intended
to be kept, should be selected out, and the rest immediately
drowned. There is great difficulty in choosing the best
at this early time; but the general opinion gives it for
those which are the lightest, that they will be the swiftest
and best as they grow up.

Others take all the whelps away; and having determined
what number they will keep, they settle the choice on
those which the bitch carries back first to the place where
she littered. But all this seems very uncertain. Others
select that which was pumped last.

Should one bitch have more whelps than she can rear,
some of them may be put to another bitch, and thus a
favourite fort may be preserved. In like manner, if only
one or two are produced, by shifting those puppies to
another bitch, the former will be foun fit to hunt again:
but she should be first phyickened, and her dogs washed
with brandy and water. Should the bitch refuse to take
the strange puppies, by killing one of her own, and rub-
bining the strangers with a little of the blood, the will lick
and immediately receive them. The bitches should be well
fed with flesh, and have also plenty of milk, nor should
the puppies be taken from them till they are able to feed
themselves. When the puppies are taken away, the bitches
should have three purging balls given them, one every
other morning, and plenty of whey the intermediate day.

The
The whelps must have good fresh straw to lie in, and it must be often changed. They are to be kept in a place where neither the rain nor sunshine can be troublesome to them; and once a week it will be proper to anoint them all over with a little nut-oil, with some saffron infused in it. This will prevent the flies from annoying them so much as they otherwise would, and will kill worms of all kinds. When they are thirteen days old, it is the custom to worm them, and a week after one joint of their faem should be twilled off. As soon as they can feed, they should have milk given them to lap; and at first two or three months old they must be weaned, keeping them wholly from the bitch; they must at this time be well kept, but not too high fed; and it is proper to put some cumin seed into their food, to keep the wind out of their bellies.

Many let the whelps of their hounds fuch three months, and then fend them away to villages to be bred up till they are ten months old, cautioning those people who have the care of them, not to let them eat carrion, nor frequent warrens.

Rye-bread is a very good food for young hounds, and is particularly recommended by many, but wrongly; for it soon pafles through them, and gives them very little nourishment. When they are fed confantly with this, in the time of their growing up, they always become narrow-backed; and this is a great fault in this fort of dog; a broad back being one of the greatest recommendations in a hound. Wheat-bread is greatly preferable on all accounts for the food of the young hound, giving him strength and firmness.

At ten months old they are to be taken home, and put into the company of the others, to live as they do, and after a few weeks keeping company with the rest, they are to be coupled, and to go out to hunt. Hounds are commonly named when first put out, and the usual mode is to name all the whelps of one litter with the fame initial letter as that of the dog that got them, or the bitch that bred them. Young hounds ought to be fed twice a day, morning and evening. It is advisable not to round them till they are well settled in the kennel, nor in very hot weather, left they bleed too freely. It may perhaps be better to round them, whilst at walk, when about six months old; if it were done sooner, it would make their ears tuck up. They should not be rounded whilst they have the difter, as the lofs of blood would too much weaken them. (See Difepals of Dogs.) If any of the young dogs be thin over the back, or more quarrclome than others, it will be of ufe to cut them. Such bitches also as are ill lonned, and that are not wanted for the purpofe of breeding, should be fpayed: they are then continually serviceable, fouter, and always in better order. Besides, if a pack hunt late in the spring, it will be very short without hounds of the above defcription. The operation fhould be performed by a perfon of skill. There is a difference of opinion whether a bitch fhould be fpayed before or after she has had a litter of puppies; both periods have an- wered: the best time is 14 or 15 days after she has taken the dog, and when the puppies juft begin to be knotted within her: all the roots of the veins fhould not be taken away, as her strength and firmness will be injured by doing: they fhould be kept low for fever al days before the operation is performed, and fed on thin meat for fome time after.

For the method of entering young hounds, fee Entrance.

For the terms used with respect to hounds, their noises, &c. see Hunting.

The hounds mostly used for hare-hunting are the deep-tongued, thick-lipped, broad and long-fung southern hounds: the fleet sharp-nosed dog, ears narrow, deep-chelled, with thin shoulders, having a quarter crofs of the fox-hound: the rough wire-haired hound, thick quartered, well hung, and not too much flecb on his shoulders: and the rough or smooth beagle. Each of these harts has its excellencies, nor can one be justly commended as superior to the other; the preference must depend on the prevalent inclination of the sportsman.

He that delights in a fix hours chace, and to be up with the dogs all the time, fhouid fend from the Southern hounds firft mentioned, or from that heavy fort which gentlemen ufe in the wold of Suffolk; their cry is a good and deep bafe muffic, and confidering how dirty the country is, the diversion they afford to thofe who are on foot for a day together, renders them in high estimation; they generally pack well from their equality of speed, and at the leat default, every noise is upon the ground in an instant to recover the feent.

In an open country, where there is good riding, the fcond fort is to be preferred; their tongues are harmonious, and at the fame time they go fo fast, as to prevent a hare from playing many tricks before them; they seldom allow her time to loiter and make much work; the mulk run and continue her foiling, or change her ground; if the latter she is soon killed, for fresh ground, efpecially on turf, is, in fome degree, one continued view. It is difficult, however, to procure a pack of faft hounds that run evenly together; some are uually found to tail, and their exertions to keep up to the leading hound, make them of little ufe, farther than enlarging the cry, unlefs when the fcent is fpread, then hounds thrown out or tailed, often come up, and hit off the fault.

It is very common for the fleetest hound to be the greffest favourite, but let a hound be ever fo good in his own nature, his excellence is obscured in that pack which is too flow for him. At moft times there is work enough for every hound in the field, and each ought to bear a part; but this it is impoffible for the heavy hounds to do, if run out of wind by the disproportionate speed of a leading hound; for it is not sufficient for hounds to run up, which a good hound will labour hard for, but they fhould be able to do fo with cafe, with retention of breath and spirits, and with their tongues at command; it can never be expected that any fcent can be well followed by hounds that do not carry a good head. It is too frequent a practice in numerouf kennels, to keep some for their muffic, others for their beauty, who at belt are silly and trifling, without noise or fagacity; this is wrong, for it is a certain maxim, that every dog which does no good, ferves only to foil the ground and confound the feent, by scampering before or interrupting their better in the moft difficult points. Five couple of truly hounds will do more execution than thirty where half of them are eager and head-frong.

The third fort are scarce; and an entire kennel of them seldom fenn; they are of Northern breed, and by many efteemed for the chance of the otter and marten, and in fome places are encouraged for that of the fox; but they are bad to breed from, being fubjeft to produce thick, heavy-shouldered dogs unfit for the chase. See Beagle.

In the choice of a hound the dog of a middling size is recommended, with his back broader than round: nose large with wide noirtres, cheek deep and capacious, illets great and high, haunches large, hams straight, feet round, the folc hard and dry,
HOUND.

dry, claws large, ears wide, thin, and more round than sharp, eyes full, forehead prominent, and upper lips thick and deeper than the lower jaw.

Much may be said for or against the several kinds of hounds. The English hounds of any sort are defensible; whoever has them of nearly equal age and speed, with the further requisites of a long nose, and the affection, will find them a more pleasing company; but the foreigner, the foxhound, the Northern, the Foxhound, or the Basset, can boast an advantage in the diversions, which few gentlemen (with every attention to their health) will ever obtain, but at a great expense of both time and money.

As to the method of breeding hounds, too much care cannot be taken in the choice of the sire from which the whelps are wanted; a very little inattention spoils the litter, which sometimes proves degenerate, although from such a sire a dog and bitch as can be put together, and where every danger of a furious crosf has been completely guarded against.

Young hounds should be entered as near the time when they are a twelvemonth old as possible, and they should be entered at the game they are designed to hunt, as mott dogs prefer that game where they are bred blooded with, and encouraged to pursue. See Hare Hunting.

2. The greyhound, or harrier, or eos canis canis, might deserve the first place, on account of his felicitous, strength, and sagacity, in pursuing his game; such being the nature of this dog, that he is speedy and quick of foot to follow, fierce and strong to overcome, yet silent, coming upon his prey unawares.

Dr. Caius derives his name from the greyhound, or gre-hound, from its being the first in rank among dogs, and that it was formerly so esteemed, appears from the report of some Caius, or Caius, that, one under the degree of a gentleman should presume to keep a greyhound. The varieties of this species are the Italic greyhound, which is small and smooth, and the Oriental, which is tall and slender, with very pendulous ears, and very long hairs on the tail, hanging down a great length. There was formerly a variety, called the Highland greyhound, which is now become very scarce, of a very great size, strong, deep-clefted, and covered with long and strong hair. See Dog.

The make and proportions required in a good greyhound, arrived at the age of two years, when he is fully grown, are, that he has a fine skin, a body neither too long nor too broad, a strong and pretty large, a long lean head, with a nose sharp from the eyes downwards, sparkling eyes, with large eye-lids, a long neck, bending like a drake, and sharp teeth, little ears, with thin girths in them, a straight, broad, and strong breast, a back straight and square, with a rising in the middle, his fore legs straight and flint, his hind legs long and straight, a round foot with large clefts, broad shoulders, round ribs, with a long space between his hips, fleasy buts, but not fat, and long tail, strong and full of sinews. The old couples that describe this species of dogs were exact in the points they recommended, as necessary to form a complete greyhound.

"Head like a flake,  
Neck'd like a drake,  
Back'd like a beam,  
Sides like a beam,  
Tailed like a rat,  
And footed like a cat."

Of this kind, those are always fittest to be chosen among the whelps that weigh lightest; for they will be fonder at the game, and stand背上 it, hindering its swiftness, till the heavier and strong bounds come into offer their assistance; whence, besides what has been already said, it is requisite for a greyhound to have large sides, and a broad forehead, that he may take his breath in and out the more easily; his belly should also be small, which otherwise would obstruct the swiftness of his course; and his hairs thin and soft.

The huntsman is to lead these hounds on his left hand, if he be on foot, and on the right, if on horseback. The best time to try and test them to the game, is at twelve months old, though some begin sooner; and enter and try the females at ten months old, which last are said to be generally more swift than the dogs; they should be kept in a clip while abroad, till they see their course; neither should you loose a young dog till the game has been a considerable time on foot, he being apt, by over eagerness at the prey, to strain his limbs.

The greyhound is the best used in open countries where there is little covert; in these places there will sometimes be a course after a hare of two miles or more, and both the dogs and the game in fight all the while. It is generally supposed, that the greyhound bitch will beat the dog in running; but this seems to be an error, for the dog is both longer made, and considerably stronger than the bitch of the same kind.

In the breeding of these dogs the bitch is principally to be regarded; for it is found by experience, that the best dogs with a bad bitch, will not get so good puppies as an indifferent dog with a good bitch. The dog and bitch should be as nearly as can be of the same age; and that the breeding of perfect and fine dogs, they should not be more than four years old; an old bitch may be used with a young dog, but the puppies of a young bitch and an old dog will never be good for any thing.

The general food of a greyhound ought to be chippings or rapsings of bread, with soft bones and gristles; and these chippings ought always to be soaked in beef or mutton broth; and when it is nearly cool, some milk should be added: this given the dog morning and evening will keep him in good heart and spirits; he must never have any hard bones given him, because they harden his mouth, and hurt his teeth. If the dog grows slick and weakly upon this diet, then take sheep's heads with the wool on, wash them clean, and boil them in a sufficient quantity of water, to make a very rich and strong broth, and add a large quantity of oat-meal to it. When the meat is very tender, and the broth thick, it is good and fit for the dog; and giving him sometimes the one, and sometimes the other, will very soon recover him. The kennel should be airy, and the door towards the south, the benches 2 or 3 feet, with holes bored to carry off the urine; the straw on the benches should be frequently changed, and the kennel kept extremely clean. See Kennel.

If one of these dogs is to run for a wager, or on any particular occasion, he may be dieted with the following bread: take half a peck of good wheat, and the same quantity of the finest and driest oat-meal; grind these together, and let the meal be sifted very fine, then add as much liquorice and aniseeds, in powder, as will not give it too disagreeable a flavour; and knead the whole into dough with the whites of eggs and new ale. This should be baked in small loaves considerably hard; and when the dog is to be fed with it, it is to be soaked in beef or other broth. He is to be led out to walk half an hour after fun-rise every morning, and half an hour before sun-set every evening, and at his coming in fed with this soaked bread. The proper exercise for a greyhound is the courting him three times a week, and rewarding him with the blood of the hare, which will animate him in the highest degree, and encourage him to profess his game. But the hare also should ever have fair play: he should
HOUND.

should have the law, as it is called, that is, have leave to run twelve score yards before the dog is flapped at her, that he may have some difficulty in the course, and not pick up the game too easily. If he kill the hare he must not be suffered to tear her, but the must be taken from him, his mouth cleaned of the wool, and the liver and lights given him by way of encouragement. Then is he to be led home, and his food to be washed with butter and beer, or rather with water and salt, and about an hour after he is to be fed. See Entrance.

When the dog is to be taken out to course, he should have nothing in the morning but a toast and butter, and then is to be kenneled till taken out to the field. The kennelling of these dogs is of great use, always giving them spirit and nimbleness when they are let loose; and the best way of managing a fine grey-hound is never to let him flit out of the kennel, except at the times of feeding, walking, or courting.

With respect to the swiftness of the grey-hound, the following questions were submitted to a gentleman, whose greyhounds are known to be as swift as any in the kingdom. Whether the speed of a grey-hound is equal to that of a first-rate race horse for the distance of a mile, or for a greater or a smaller distance? and, whether the speed of any hare (supposing the dog and hare to be started without the law) usually allowed to the hare in courting) is equal to that of the grey-hound, and to what distance, within that of a mile, the hare could exert that superiority of speed, supposing the hare to be the fastest animal of the two? His opinion was, that upon a flat, a first-rate horse would be superior to the grey-hound, but in a hilly country, as in Wiltshire, a good grey-hound would have the advantage; on the second point, that although he had seen many hares go away from grey-hounds, laid close in with them, without a turn, yet he believes a capital grey-hound (to laid in) would not suffer a hare to run from him without turning her. An incident, however, occurred in December 1820, which brought the speed of the grey-hound and race horse into competition. A match was to have been run over Doncaster course for one hundred guineas, but one of the horses having been drawn, a mare started alone to make good the bet, and after having gone the distance of about a mile, a grey-hound bitch started from the side of the course, and ran with her the other three miles, keeping nearly head to head, which produced a singular race, and when they arrived at the distance-poll, five to four was betted on the grey-hound; when they came to the fland it was even betting. The mare won by about a head.

In February 1820, a brace of grey-hounds in Lincolnshire ran a hare from her feet to where killed, a distance, measuring straight, upwards of four miles, in twelve minutes; during the course there was a great number of turns, which very considerably increased the space gone over; the hare ran herself dead before the grey-hounds touched her; this extensive course, in so short a time, is a strong proof of the strength and swiftness of the hare. Horses have been as much distressed in keeping up for their riders to see a course, as in much longer chases with hounds. The compiler (says Mr. Daniel) recollects a hare being found close to the town of Boffingham, in Cambridgeshire, and which took away for the fix mile bottom, twenty-two horses started, but only one could make a gallop at the conclusion of the course; the hare (who was within fifty paces of the cover) was dead some yards before the grey-hounds, who were obliged to be led to recover them.

The remark made during his troubles, by the unfortunate Charles I. upon the grey-hound's affability, was just as applied to the animal, and a keen satire upon those that surrounded him; a discourse arose respecting what sort of dogs deserved page-eminence, and every one allowed it to belong to the spaniel or the grey-hound. The monarch gave his opinion in the grey-hound's behalf, because (said he) it has all the good nature of the spaniel, without the forenoon.

Many influences might be mentioned of the high spirit and courage, as well as uncommon accuracy and velocity of greyhounds. If it be asked, what is allowed at the present day to be the best breed of them? The blood of the late lord Berkeley's dogs engraven into those of Wiltshire and Yorkshires has turned out the best grey-hounds. Allowing for some exceptions, it is generally imagined that grey-hounds crossed from the fore-mentioned blood have proved themselves superior to others.

3. The grey-hound, or bragh, is a dog more beholden to the sharpness of his sight, than his nose or smelling; by virtue of which he makes excellent sport with the deer and hare. He is also noted as exquisite in controlling one that is not lone or lean, but full, fat, and round which, if it happen to return, and be manged again with the residue of the herd, he will soon fpy out, and leave the rest untouched, never ceasing, after he has separated it from its company, and till he has wearied it to death.

These dogs were much used in the north of England, and on champain ground; rather than bulky and woody places, and by horsemens more than footmen. If at any time he happen to take a wrong way, upon the usual sign made by his master, he immediately returns, takes the right and ready course, beginning his chase afresh, with a clear voice, and swift foot, following the game with as much courage as at first.

This species, which was the aggenus of Dr. Caius, says Mr. Pennant, is now lost, or at least unknown to us; and it is very different from the aggenus of Oppian, which is our bragh, which see. See also Doc.

4. The blood-hound, or canis sager of Linneus, differs nothing in quality from the Scottis' flat bound, derived from the Saxon flat, the impression which a deer leaves of its foot in the mire, and hound, a dog,aying that it is longer shaped, and not always of the same colour, but sometimes red, rued, black, white-spotted, &c. though most commonly either brown or red.

Their nature is, that being fit on by the voice and words of their leader, to call about for the fitting of the present game, and having found it, they will never cease pursing it with full cry, till it be tired, without changing for any other.

They seldom bark, except in their chase, and are very obedient and attentive to the voice of their leader. Those that are really good, when they have found the hare, make how thereof to the huntsman by running more speedily, and with gesture of head, eyes, ears, and tail, winding to the form or hare's male, never giving over prosecution, and running with a gallant noise.

They have good and hard feet, and lately flamings, and are very properly denominated singularly or blood-hounds, on account of their extraordinary scent; for if their game be not first wounded, so that it escapes the huntsman's hands, or if it be killed, and never so clearly carried away, these dogs, by their exquisite smell, will discover it, and not be wanting, either by nimbleness or greediness, to come at it, provided there be any stains of blood. Nay, though by all the cunning and foresight imaginable, a beast be conveyed away without spot or blood, yet through the rough and most crooked ways and incantors, this dog will find out the deer—
The blood-hound was in great request on the confines of England and Scotland, where the borders were continually preying on the herds and flocks of their neighbours. The true blood-hound, says Mr. Pennant, was large, strong, muscular, and broad-breasted, of a stern countenance, of a deep tan-colour, and generally marked with a black spot above each eye. See Dog.

5. The terrier, or terriers, only hunts the fox or badger; being thus called, because after the manner of a ferret in searching for conies he leaps into the ground, and affrights or attacks the beasts, either tearing them in pieces, or halting them out by force; or, at least, driving them out of their harbours to be taken in a net, or otherwise. See Dog.

The huntsmen have commonly a couple of terriers, that they may put in a fresh one, as occasion serves, to relieve the other.

The time of entering the terrier is when he is near a twelve-month old: if it be not done within that time, he will hardly be brought to take the earth. This entering and flushing of them may be performed several ways. First, when the foxes and badgers have young cubs, take an old terrier, let him into the ground, and when he begins to bay, hold the young one at the hole or mouth of the earth, that he may listen and hear the old one's bay. The old fox or badger being taken, so that nothing remains within but the cubs, couple up the old ones, and put in the young in their steads, encouraging them by crying to him, to him. If they take any cubs within, let them do it with what they list; not forgetting to give the old terriers their reward, which is blood and livers, fried with cheese, and some of their grease;ewing them also heads and skins to encourage them.

Hound-fish, in Ichthyology, (see Squalus mustelus,) the smooth hound-fish, or hound-fish.

Hound Point, in Geography, a cape of Scotland in the Frith of Forth, and N. coast of the county of Linlithgow; seven miles W.N.W. of Leith.

Hound's Tongue, in Botany. See Cynoglossum.

Hounds, in a Ship, are those parts of a mast-head which gradually project on the right and left side, beyond the cylindrical or conical surface, which it preserves from the partners upwards. The hounds, whose upper parts are also called cheeks, are used as shoulders to support the frame of the top, together with the top-mast and rigging of the lower masts.

Hounsblow, in Geography, a town, partly belonging to the parish of Helton, and partly to that of Ilcworth, in the hundred of Offullon, and county of Middlesex, England. It is chiefly supported by its great thoroughfare, and abounds with inns and public-houses for the accommodation of travellers. Here was formerly a market, which is now discontinued: but a fair is held here every Trinity Monday. At the western extremity of the town is a chapel of ease, which formerly belonged to a priory, that was founded in the thirteenth century. The architecture, and some ornaments in the chapel, indicate the age of the building to have been coeval with the foundation of the priory. In the chancel is a monument for Whitelocke Bullfride, e.q., who died November 27, 1724. Adjoining the town is a large tract of waite land called Hounslow-heath. According to a survey made in the year 1746, this heath contained 4293 acres, nearly the whole of which was then waste, and almost useless. It continued in this state till within the last 20 years, but an act of parliament has been recently obtained to inclose and cultivate it. Many acres are now under tillage, and will consequently be rendered beneficial to the community, and profitable to the proprietors. (See Middleton's Agricultural Survey of Middlesex.) This heath has been noted in the annals of military history, and also in those of Newgate. Velliges of ancient encampments are still visible, and it is related that the military forces of the kingdom have frequently been assembled and brought to action here. In 1267, the earl of Gloucester, leading the Londoners against king Henry III. assembled them on Hounslow-heath. King Charles's army, after the memorable battle of Brentford in 1647, entrenched themselves here. On the 3d of August 1747, the parliamentary forces, amounting to 20,000 foot and horse, under Sir Thomas Fairfax, were assembled on this heath, when the speakers of both houses of parliament were present. Several other influences might be cited.

In the year 1723, barracks were erected here to contain above 400 soldiers, with horses, &c. Large gun-powder and oil mills are standing upon the banks of the old river. The former have several times taken fire, and several buildings have been blown up. Lysons's Environs of London, vol. iii.

HOU-QUANG, a province of China, occupying nearly the centre of the empire; bounded on the N. by Honan, on the E. by Kiang-fu and Kiang-nan, on the S. by Quang-fu and Quang-tong, and on the W. by Szechuen and Koo-chou, about 480 miles from N. to S. and 350 from E. to W. The river Yang-tsekiung traverses this province from W. to E., and divides it into two parts, the northern and southern. The greater part of the province is level, watered by lakes, canals, and rivers, and celebrated for its fertility. By the Chinese it is called the fore-house of the empire, and among them it is a common saying, that "the abundance of Kiang-fu could furnish all China with a breakfast; but the province of Hou-quang alone could supply enough to maintain all its inhabitants." People boil much of their cotton cloths, simple, gold-mines, wax, and paper made of the bamboo reed. The capital of the whole province is Youtchang, and its population, as stated by Sir George Staunton, 27 millions. The northern part of the province contains eight cities of the second and third. The southern comprehends seven of the first and 54 of the second and third, exclusive of forts, towns, and villages, which are in every where abrupt.

HOUR, in Chronology, an aliquot part of a natural day, usually 24th, sometimes 12th.

The origin of the word hora, or hour, so comes, according to some authors, from a turnage of the sun, the father of hours, whom the Egyptians call Horus. Others derive it from the Greek ἀξίων, to contain, distinguis, &c. Others from the word aporo, urine; pretending that Threfmegitus was the first that settled the division of hours; which he did from observation of an animal consecrated to Serapis, named the cynocephalus, which makes water twelve times a day, and as often in the night, at equal intervals.

An hour with us is a measure or quantity of time, equal to a twenty-fourth part of the natural day, or nycthemeron; or it is the duration of the twenty-fourth part of the earth's diurnal rotation. Fifteen degrees of the equator answer to an hour; though not precisely, but near enough for common use.

The hour is divided into sixty minutes, the minute into sixty seconds, &c.

The division of the day into hours is very ancient; as is shown by Kircher, Geis. Egypt. tom. ii. part ii. clav. vii. cap. 8, though the passages he quotes from Scripture do not prove it. The most ancient hour is that of the twelfth part of the day. Herodotus, lib. ii. observes, that the Greeks learnt
learnt from the Egyptians, among other things, the method of dividing the day into twelve parts. The astronomers of Cathay, &c. bishop Beveridge observes, still retain this division. They call the hour chag; and to each chag they give a peculiar name, taken from some animal: the first is called with, mouse; the second chu, bullock; the third cen, leopard; the fourth mau, hare; the fifth chin, the crocodile, &c.

The division of the day into twenty-four hours was not known to the Romans before the Punic war. Till that time they only regulated their day by the rising and setting of the sun.

They divided the twelve hours of their day into four; viz. prim, which commenced at six o'clock, second at nine, third at twelve, and none at three. They also divided the night into four watches, each containing three hours.

There are divers kinds of hours, used by chronologers, astronomers, dialists, &c.

Sometimes hours are divided into equal and unequal.

Hours, Equal, are the twenty-four parts of a day and night precisely; that is, the time wherein the fifteen degrees of the equator mount above the horizon.

These are also called equinoctial hours, because measured on the equinoctial; and astrological, because used by astrologers.

They are also differently denominated, according to the manner of accounting them in different countries.

Hours, Astronomical, are equal hours, reckoned from noon, or mid-day, in a continued series of twenty-four.

Hours, Babylonian, are equal hours, reckoned from funris in a continued series of twenty-four.

Hours, European, are equal hours, reckoned from midnight; twelve from thence till noon, and from noon till midnight twelve more.

Hours, Jewish, or Planetary, or Ancient, are twelfth parts of the artificial day and night.

Hence, as it is only in the time of the equinoxes that the artificial day is equal to the night, it is then only that the hours of the day are equal to those of the night: at other times they will be always either increasing or decreasing.

They are called ancient or Jewish hours, because used by the ancients, and still among the Jews. They are called planetary hours, because the astrologers pretend, that a new planet comes to predominate every hour; and that the day takes its denomination from that which predominate the first hour thereof: as Monday from the moon, &c.

Hours, Italian, are equal hours, reckoned from sun-set, in a continued series of twenty-four.

The geographical solution of this problem is performed by projecting stereographically on the plane of the meridian the oblique-angled spherical triangle, which is made by the complement of the latitude, the complement of the sun’s altitude, and the sun’s distance from the elevated pole.

To find the hour of the day, when the latitude of the place, the sun’s declination, and his altitude, are given. Thus, suppose the latitude is 51° 32’, the sun’s declination 18° north, and his altitude 40°, to find the hour of the day.

The geometrical solution of this problem is performed by projecting stereographically on the plane of the meridian the oblique-angled spherical triangle, which is made by the complement of the latitude, the complement of the sun’s altitude, and the sun’s distance from the elevated pole. Thus with the chord of 60° (Plate XVI. Astrology, § 142.) draw the primitive circle Z O N H; quarter it; also draw the axis P C P through the poles, and the equinoctial E C Q; likewise the parallel of declination D O d equal 18; then draw parallel to the horizon H O, the almanac or parallel of the fun’s altitude A a = 40°, to cut the parallel of the fun’s declination in C, the place of the fun at that time. Then through O draw two great circles, one through Z and N the poles of the horizon, and the other through P and P the poles of the equinoctial, as Z O N, and P O P; which form the oblique-angled spherical triangle P Z O; and the angle P Z O, measured on the line of half tangents, gives the hour of the day from twelve, viz. 47° 20’ equal to three hours nine minutes nearly, or to 51 minutes after eight in the morning, or 51 minutes before four in the afternoon. But by spherical trigonometry, having three sides given, that is, Z P, 38° 28’, the complement of the latitude, Z O, 50° 03’, the complement of the sun’s altitude, and P O, 72° 00’, the sun’s distance from the elevated pole (which is the declination added to 90°, when the latitude and declination are of a contrary name; but if of one name, it is the complement of the declination); and the angle Z P O, the hour of the day, is found by case 11. of spherical trigonometry, as follows.

First add the complement of the latitude, complement of the fun’s altitude, and the fun’s distance from the elevated pole, into one sum. Secondly, from half that sum subtract the complement of the sun’s altitude, noting the half sum, and the remainder; then the complement arithmetical of the fines of the complement of the latitude, and the fun’s distance from the pole, and the fines of the said half sum and remainder, added together; the fine of half this sum, doubled, and subtracted from 180 degrees, gives the hour from noon.

Which doubled gives 132° 40’.

Vol. XVIII.
This subtracted from 180°0′ leaves 47°20′ equal to three hours nine minutes nearly; the same as before.

By the same operation you may find the sun's azimuth P Z C, if instead of the complement of the sun's altitude you subtract the sun's distance from the pole, noting the half fun and remainder as before. And the rule will stand thus: to the complement arithmetical of the fin of the complement of the latitude, and complement of the fun's altitude, add the fin of the aforesaid half sun and remainder; then the half of the total these four, doubled, and taken from 180 degrees, gives the sun's azimuth from the north, in north latitude; and from the south, in south latitude.

If the hour of the night is required, the height of some star must be taken. And it is found by adding to, or subtracting the right ascension of that star from that of the sun.

To find the hour of the day or night by the globe, see GLOBE.

Hour, in Mining, is used by several foreign writers to express 1/24th part of the circumference or horizon, or 15° of azimuth; the fourth and the north being called twelve hours, the east and well six hours; and in describing the course or range of a vein or stratum, they say, if N.W. and S.E., that it has a nine o'clock range, &c. In the same manner, English colliers, speaking of the prevailing dip of the strata, say, that the meanres generally dip to the ten o'clock fun; and the colleris of Derbyshire are found by Mr. Fawby generally to face the two o'clock fun, or the lines or lengths ways joints, at right angles to these, tend to the eight o'clock fun, which is the deep end or the rife-end of the works, according as the slate dips towards the N.W. or S.W. or vice versa.

Hours, Hora, in the Ancient Mythology, were certain goddesses, the daughters of Jupiter and Themis; at first only three in number, Eumena, Dike, and Irene; to which were afterwards added two more, Carpo, and Thalatte.

Homer makes them the door-keepers of heaven. Ovid allot them the employment of harrowing the horses of the fun:

"Jungere equos Titan velocibus imperat Hori."

And speaks of them as standing, at equal distances, about the throne of Sol:

"et pollices spatia equibus, Hora."

Hours, Hora, in the Romish Church, are certain prayers performed at stated times of the day; as matins, vespers, lauds, &c.

The former hours, are prime, terce, sext, and none. They are called hours, or canonical hours, as being to be rehearsed at certain hours preferred by the canons of that church, in commemoration of the mysteries accomplished at these hours. These hours were anciently also called coarse, cursus. P. Mabilioi has a dissertation on them, entitled de Curfu Gallicano.

The first constitution enjoining the observance of the canonical hours, is of the ninth century, being found in a capitular of Heito, bishop of Brazil, directed to his curates, importing, that the priets shall never be absent at the canonical hours, either by day or night.

Hours, Prayers of forty, are public prayers continued for the space of three days successively, and without intermission before the holy sacrament, to obtain the aflnitude of heaven or some important occasion.

In these days, care is taken, that the holy sacrament be exposed forty hours, viz. thirteen or fourteen hours each day.

Hour-circles, or Horary Circles, in Astronomy, &c. are great circles, meeting in the poles of the world, and crossing the equinoctial at right angles; the same as meridians. They are supposed to be drawn through every fifteenth degree of the equinoctial and equator, and on both globes are supplied by the meridian hour-circle and index. See GLOBE.

The planes of the hour-circles are perpendicular to the plane of the equinoctial, which they divide into twenty-four equal parts.

Hour-glass, a popular kind of chronometer or clepsydras, serving to measure the flux of time, by the defcending or running of sand out of one glass vielded into another.

The bolt hour-glasses are those, which, instead of sand, have egg-shells well dried in the oven, then beaten fine and filled into the glass.

Hour-glasses are much used at sea for reckoning, &c.

There is also a sort of Hour-glasses, which depend on the flux of water, or some other liquid, more properly called elopidera. See CLEPSYDRA.

Hour-lines, on a Dial, are lines which arise from the intersections of the plane of the dial, with the several planes of the hour-circles of the sphere, and therefore must all be right lines. See DIAL.

Hour-scale, a divided line on the edge of Collins's quadrant, being only of tangents of forty-five degrees each, set together in the middle. Its use, together with the lines of latitude, is to draw the hour-lines of dials that have centres, by means of an equilateral triangle, drawn on the dial-planes. See Dialling lines, and Scale.

HOURA, in Geography, a small island near the W. coast of Scotland. N. lat. 57° 56'. W. long. 5° 16'.

HOURIS, in Modern History, is a name given by the Mahometans to those females that are designed for the faithful in paradise. These are not the same with whom they have lived on earth, but formed for this purpose, with singular beauty and undecaying charms.

HOURSAK, in Geography, a town of Persia Armenia; 130 miles E.N.E. of Eivan.

HOUSAGE, a fee which a carrier, or other person, pays for laying up goods in a house.

HOUSANABUD, in Geography, a town of Hindoostan, in Bahar.

HOUSANGUNGE, a town of Hindoostan, in Oupe; 40 miles N. of Manicopaun.

HOUSTONICK, or HOUSTONXEC, signifying in the Indian language "over the mountain," a river of Connecticut, which has two sources; one in Laneborough, the other in Windor, both in Berkshire county, Massachusetts. These branches unite in Pittsfield, and the river, after falling through a number of towns, discharges itself into Long Island Sound, between Stratford and Milford, in Connecticut. It is navigable about 12 miles to Derby. Between Salisbury and Canaan, this river forms a cataract 150 yards wide, and 60 feet in perpendicular fall. Several useful mills and iron works are erected on the falls of this river.

HOUSE, a habitation, or a building constructed for sheltering a man's person and goods from the inclemencies of the weather, and the injuries of ill disposed persons. Houses differ in magnitude, being of two or three, and four stories,
stories, in the materials of which they consist, as wood, brick, or stone, and in the purposes for which they are designed, as a manor-house, farm-house, cottage, &c. Ancient Rome consisted of forty-eight thousand houses, all inhabited or detached from one another.

For the number of houses, and of inhabitants to a house in England, &c. see the article Expectation of Life. See also each county and town, under its respective appellation.

A pleasure house, or country house, is that built for occasional residence, and for the pleasure and benefit of retirement, air, &c. This is the villa of the ancient Romans; and what in Spain and Portugal they call quinta; in Provence, caffine; in some other parts of France, élodie; in Italy, villa.

The citizens of Paris have also their maisons de bottailles, bottle houses, to retire to, and entertain their friends; which in Latin might be called mica; the emperor Domitian having a house built for the like purpose, mentioned under this name by Martial, lib. ii. ep. 59.

It is a thing principally to be aimed at, in the site or situation of a country house, or seat, that it have wood and water near it.

It is far better to have a house defended by trees than hills; for trees yield a cooling, refreshing, sweet, and healthy air and shade, during the heat of the summer, and very much break the cold winds and tempests from every point in the winter. The hills, according to their situation, defend only from certain winds; and if they are so situated in the north-side of the house, as they defend from the cold air in the winter, so they also deprive you of the cool refreshing breezes, which are commonly blown from thence in the summer. And if the hills are situate on the south side, they then prove also very inconvenient.

A house should not be too low seated, since this precludes the convenience of cellars. If you cannot avoid building on low grounds, let the first floor above the ground the higher, to supply what you want in your cellar in the ground; for in such low and moist grounds, it conduces much to the dryness and healthiness of the air to have cellars under the house, so that the floors be good and cleft underneath. Houses built too high, in places obvious to the winds, and not well defended by hills or trees, require more materials to build them, and more also of reparations to maintain them; and they are not so commodious to the inhabitants as the lower-built houses, which may be built at a much easier rate, and also as complete and beautiful as the other.

In buildings or houses not above two stories with the ground-room, and not exceeding twenty feet to the raifon-place, and upon a good foundation, the length of two bricks, or eighteen inches for the heading course, will be sufficient for the ground-work of any common structure, and six or seven courses above the earth to a water-table, where the thickness of the walls is abated, or taken in, on either side the thickness of a brick, namely, two inches and a quarter.

For large and high houses, or buildings, of three, four, or five stories with the garrets, the walls of such edifices ought to be from the foundation to the first water-table three heading courses of brick, or twenty-eight inches at least; and at every story a water-table, or taking in on the inside for the summers, girders, and joints, to rest upon, laid into the middle, or one quarter of the wall at least, for the better bond. But as for the innermost or partition wall, a half brick will be sufficiently thick; and for the upper stories, nine inches, or a brick length, will suffice.

The parts, proportions, &c. of the houses in London, are regulated by statute. See Building, and article Fire-locks.

Every man has a right to air and light in his own house; and therefore if any thing of an infectious smell be laid near the house of another, or his lights be stopped up and darkened by buildings, &c. they are nuisances punishable by our laws; but no action lies for merely obstructing the opening of a prospect. If a man's house be attacked with intent to kill, and the owner or his servants kill the thieves in defending him and his house, this is not felony, and incurs no forfeiture. One man may compel another to repair his house in several cafes, by the writ de domo reparanda. The doors of a house may not be broke open on arrears, except in cafes of treason or felony, &c. The riotously pulling down of a house is felony excluded clergy. Stealing lead, or iron bars, or rails fixed to houses, &c. is felony punishable by transportation, by 4 Geo. cap. 32. The hundred is liable to damages by the burning of houses.

9 Geo. cap. 32. See Asison, Burglary, &c.

House-cricket, in Entomology. See Gryllus domesticus.

House, Hot. See Hot-house and Stove.

House, Green. See Green-House.

House, Ice. See Ice.

House-lamb, in Rural Economy, a name given to that fort of lamb which has been reared and fattened in the house.

See Lamb-fuckling.

House, Summer, a little edifice erected at the corner of a garden, and contrived so as to let air in on all sides; or to exclude it, as you find proper.

House, Town, or Hall, is a place where the officers and magistrates of a town or city hold their meetings, for the due administration of their laws and policy. See Hall and Guild.

House, Work. See Work-house and Bridewell. See also the article Raphaelus.

House of Correction. Justices of the peace in feoffons are to make orders for erecting or enlarging houses of correction, and for the maintenance and government of the same, and for the punishment of offenders committed thereto; on presentment of the grand jury, or of a Justice on his own view or knowledge, that such houses are wanted. (7 Jac. I. c. 4. 17 Geo. II. c. 5. 14 Geo. II. c. 35. 22 Geo. III. c. 64. 24 Geo. III. feff. 2. c. 55.) In every county of England there shall be a house or houses of correction, built at the charge of the county, with all conveniences for the letting of people to work. The expence of building, repairing, and purchasing land, &c. for houses of correction, and maintaining them, shall be defrayed by order of the justices in feoffons, by the monies raised in the same manner as the general county-rate; and when the amount thereof shall exceed one-half of the amount of the ordinary annual assessment for the same, (computed at a medium for the last five preceding years), they may borrow on mortgage of the said rates, any sum not less than 50l. nor more than 100l. each, ordering the interest to be paid off yearly, and so much of the principal sum as shall at least be equal to the interest, until the whole shall be discharged; provided that the whole money borrowed be fully paid within 14 years from the time of borrowing the same. (17 Geo. II. c. 5. 22 Geo. III. c. 64. 24 Geo. III. feff. 2. c. 55.) The justices at their quarter feoffons shall nominate one or more justices, within their respective districts as visitors and inspectors, who shall report to the next quarter feoffons. And the justices in feoffons are to appoint governors or masters of such houses of correction, and their salaries, &c. which are to be paid quarterly out of the county rate. They may also allow such
governors some proportion of the profits earned by the prisoners. The salaries shall be fixed with a reference to the quantity of work done. (22 Geo. III. c. 64. 31 Geo. III. c. 76.) These governors are to let the persons lent on work, and to punish offenders (except by whipping); and in case of repetition of offences to report to the visiting justices, who shall order such offenders to be punished, either by moderate whipping, repeated whippings, or close confinement for any term not exceeding one month. Governors are to yield a true account every quarter-seas of persons committed to their custody; and if they suffer any to escape, the justices may fine them.

The justices, at some general or quarter-seas, at which five justices, at the leat, shall be present, may make such rules and orders for receiving, separating, classing, dieting, clothing, maintaining, employing, reforming, governing, managing, treating, and watching offenders during their confinement in penitentiary houses, according to 19 Geo. III. c. 47. (See Penitentiary Houses, and Transportation.) Such rules and orders are to be submitted to the judges of assize, &c. 31 Geo. III. c. 46. If persons ordered to hard labour shall escape, or be afflicted in escaping, or refused, every such offence shall be punished in the same manner as the like offence would be punished by 19 Geo. III. c. 74, concerning penitentiary houses. Separate apartments shall be provided by 22 Geo. III. c. 64. By the same act, the governor or keeper of every house of correction shall employ persons, not committed to hard labour, in some work that is not severe, and allow them half their earnings, to be paid at the time of their discharge. The justices in seassions may also appoint, at pleasure, a minister of the church of England, residing near the house of correction, to perform divine service there every Sunday, and appoint him a salary not exceeding 20l. a-year. No governor or assitant shall fell, or be licenced to fell, or have any benefit from the sale of any wine, ale, beer, spirituous or other liquors; nor shall such liquors be brought into the house of correction, to be drank there, unless for a medical purpose, by a written direction, under the hand of the apothecary or surgeon attending such house, under a penalty of 50l. The master shall deliver to the justices, at every general quarter-seas, a written account of the persons in custody, with the offence of each, time of commitment, distinguishing the age and sex of those committed to hard labour, theibus in which they have been employed, and the behaviour of each during confinement.

The house of correction is for the employing and punishing of idle and disorderly persons, parents of bad children, beggars, errants running away, trefpassers, rogues, vagabonds, &c. Poor persons refusing to work, are there to be whipped, and let to work and labour; and any person who lives extravagantly, having no visible way to support himself, may be sent to the house of correction, and let to work there, and may be kept there, until he gives the justice satisfaction in respect to his living, but not to be whipped. A person ought to be convicted of vagrancy, &c. before he is ordered to be whipped.

Whereas doubts may arise where authority is given to any justice or justices, to commit offenders to the house of correction, for offences cognizable before them out of seassions, how long offenders may be there detained, and in what manner treated, when the time and manner of their punishment is not by law expressly limited; it is enacted by 17 Geo. II. c. 5, that when any offender shall be committed as aforesaid, by virtue of any law in being, or to be made, and the time and manner of their punishment are not expressly limited, the said justice or justices shall commit such offenders to the house of correction, there to be kept to hard labour until the next general or quarter-seas, and until discharged by due course of law: and two justices (of whom the justice who committed him to be one) may discharge the said offender before the seassions if they see cause: and if he shall not be so discharged, the said seassions may either discharge him or continue him farther, not exceeding three months. A table of rules and orders for the government of houses of correction, is ordered to be fixed in some conspicuous place of such houses by 22 Geo. III. c. 64, of which the following is an copy:

"Rules, orders, and regulations to be observed and enforced at every house of correction provided and established, or to be provided and established, under the authority of the acts of the 7th year of the reign of his late majesty king James I. the 17th of king George II. and the 22d of king George III.

1. That the several persons who shall be committed to the house of correction to be kept to hard labour, shall be employed (unless prevented by ill health) every day during their confinement (except Sundays, Christmas day, and Good-Friday), for so many hours as the day-light in the different latitudes of the year will admit, not exceeding twelve hours, being allowed thereout to rest half an hour at breakfast, an hour at dinner, and half an hour at supper, and that the intervals shall be noticed by the ringing of a bell.

2. That the governor of every house of correction shall adapt the various employments, which shall be directed by the justices at their quarter-seas, to each person in such manner as shall be best suited to his or her strength and ability, regard being had to age and sex.

3. That the males and females shall be employed, and shall eat and be lodged in separate apartments, and shall have no intercourse or communication with each other.

4. That every person so committed shall be fullfilled with bread, and any coarse but wholesome food and water; but persons under the care of the physician, surgeon, or apothecary, shall be fullfilled with such food and liquor as he shall direct.

5. That the governor, and such other persons (if any) as shall be employed by the justices to assist the governor, shall be very watchful and attentive in seeing that the persons so committed are constantly employed during the hours of work; and if any person shall be found remiss or negligent in performing what is required to be done by such person to the best of his or her power and ability, or shall wilfully waste, spoil, or damage the goods committed to his or her care, the governor shall punish every such person in the manner hereafter directed.

6. That if any person so committed shall refuse to obey the orders given by the governor, or shall be guilty of profane cursing or threatening; or of any indecent behaviour or expression; or of any insult, quarell, or abusive words, to or with any other person: he or she shall be punished for the same in the manner hereafter directed.

7. That the governor shall have power to punish the several offenders for the offences herein before described, by closer confinement; and shall enter in a book, to be kept by him for the inspection of the justices at the quarter-seas, and the visiting justice or justices, the name of every person who shall be so punished by him, expressing the offence, and the duration of the punishment inflicted."

Bridewell is a prison for correction in London, and offenders may be sent thither. See Bridewell and Hospital.

House is also used for a convent or monastery. Regular priests give the name. Houses they refer
refide in, and not that of convents or monasteries, which properly belong to hontuble friars. Thus we say the Jesuits’ house, and the Barnabites or Theatins’ house.

The Jesuits have both professed houses, and colleges for novices, which they call houses of probation. They have also houses of retreat for spiritual exercises, where they receive secular persons and ecclesiastics disposed to practice the same with them for eight or ten days.

House is also used for one of the cities of the kingdom assembled in parliament.

Thus we say, the house of lords, the house of commons, &c. See Commons, Parliament, and Peers.

House is also used for a noble family; or a race of illustrious persons issued from the same stock. See Genealogy.

In this sense we say, the house or family of the Stuarts, the house of Bourbon, the house of Hanover, of Austria, of Savoy, &c.

House, in Astrology, a dodecathemary, or 12th part of the heavens.

The division of the heavens into houses is founded on this, that the stars and planets, when found herein, are supposed to have certain influences, either good or evil, upon the human body; and to each house is assigned its particular virtue or influence; upon the consideration whereof they draw horoscopes. See Horoscope.

This division is made by fix great circles, called circles of position, which cut each other in the common intersection of the meridian and horizon, in the ordinary way of demitting, which is that of Regiomontanus: for the ancients had three other ways.

Thee circles divide the equator into 12 equal parts, of 30 degrees each, without any regard to the zodiac. The horizon and meridian are two circles of the celestial houses, which divide the heavens into four equal parts, each whereof comprehends three houses. There are fix above the horizon, and as many below it; and fix eastern and fix western houses. The scheme or figure of the heavens consists of 12 triangles, which are likewise called houses; wherein are laid down the stars, signs, and planets, comprièd within the respective spaces of the circles of position.

Each planet has two certain houses, whereof they say it exerts itself with peculiar vigour. Leo is the sun’s house, and Cancer that of the moon; Capricorn is Saturn’s, &c.

Some call the houses dodecathemaries; but that name is more immediately appropriated to the twelve signs or divisions of the zodiac. See Dodecathemary.

The Astrological houses have their particular names according to their qualities. The first is the house of life, being the ascendant, and containing five degrees above the horizon, the ten degrees below it; the second is the house of riches; the third, the house of children; the fourth, the lowest part of heaven, the house of relations, and the angle of the earth; the fifth, the house of children; the sixth, the house of health; the seventh, the house of marriage, and the angle of the world; the eighth, the house of death, and upper gate; the ninth, the house of plenty; the tenth, the house of offices; the eleventh, the house of friends; and the twelfth, the house of enemies.

It is popularly, and as it were poetically, said, that the sun had 12 houses, by which are meant the 12 signs, though in reality it has only one sign, viz. Leo: besides, the division of houses is accommodated to the equator, and not the zodiac.

They begin numbering the houses with the ascendant, and pass them to the innum contemplation of the tenth.

Houses, Differences of, in Heraldry. See Differences.

House, in Literature, a place of assembly for the residence of certain persons, or the place where they hold their meetings. It is the place of residence of a noble family.

Still when the name of house is used of a family, it is the family house, or the city where they dwell.

Another use of the term is the house of parliament, where the commons and the lords assemble together.

Good house, in Genealogy, a family distinguished for its ancient origin.

Jesuitical house, a family of the Jesuits, or the house of the Jesuits.

Jesuit, a member of the society of Jesus.

House, in Mines, a place of residence of the inhabitants of a coal, or any other valuable coal, or stone, or other coal, and is the place of residence of the inhabitants of a coal, or any other valuable stone.

House, in Geography, one of the Shetland islands, about seven miles long and one broad. N. lat. 60° 44′. W. long. 1° 35′.

House, in Literature, a place of residence of certain persons, or the place where they hold their meetings. It is the place of residence of a noble family.

House, in Literature, a place of assembly for the residence of certain persons, or the place where they hold their meetings. It is the place of residence of a noble family.

House, in Literature, a place of residence of certain persons, or the place where they hold their meetings. It is the place of residence of a noble family.

House, in Literature, a place of residence of certain persons, or the place where they hold their meetings. It is the place of residence of a noble family.

HOUSE OF RECOVERY.

necessarily tend to propagate itself to an indefinite extent. And such, in fact, has been the actual state of the cafe, in all large and crowded towns, until within a very few years. The inhabitants of the cellars and garrets in the dirty alleys and lanes in Manchester, Liverpool, London, Dublin, &c. &c. have been found to suffer severely from the generation of infectious fevers in their apartments, or from the re-}

ready propagation of it, whenever introduced.

From the nature of the accommodation of the poor in their lodging-houses, from their inability to preserve cleanliness, and from the contiguous nature of the different apartments of these houses, and the fact that a small-pox fever is contagious, it is also readily propagated, and becomes an irremovable inmate, as it were, of the house. "When a fever either arises in, or is introduced into, the house of a poor person, every circumstance favourable to its progress, generally attacks the family in succession: their clothes, and the woollen and cotton part of their furniture become infected, retain the infection tenaciously, and are capable of communicating the disease for a long time. These can neither afford to purify or destroy. Thus their dwellings and persons continually breathe contagion; and where this is the situation, not of one family only, but of a great number, it is hardly possible to prevent a communication of the disease to the families of the rich, among whom it would never have been produced." (Ferrari’s Med. Hist. and Reflected. vol. i. p. 243.) The same author, speaking of the situation of some of these habitations of the poor in Manchester, observes, "In these houses a very dangerous fever constantly subsists, and has fulfilled for a considerable number of years. I have known nine patients confined in fevers at the same time in one of these houses, and crowded into three small dirty rooms, without the regular attendance of any friend or even of a nurse. Four of these poor creatures died, absolutely from want of the common offices of humanity, and neglect in the administration of their medicines. As soon as one dies, or is driven out of his cell, he is replaced by another, who soon feels, in his turn, the consequences of breathing infected air. In most of these places lodgers are received; the consequence is a perpetual succession of fever patients among them." That these representations are faithfully correct, those who have had an opportunity of visiting the sick poor in this metropolis can evince. We have seen the inhabitants of the same house attacked, several successive times, by the influence of their own contagion. Even the convalescents, from their confinement in the midst of infection, have frequent relapses, so that the disease would sometimes continue on the same spot for several months together.

It must be obvious, that these evils of contagion are constant fountains of danger to the public, and that diseases may be communicated even to distant quarters of the town, by the sale of clothes, impregnated with it in its most active form (see Dr. Willan on Scarletina), and by the public coaches, &c. And it must be not less clear, that the mere removal of a few infected individuals to the public hospitals, is altogether inadequate to strike at the root of the evil, although it may preserve the lives of some of the individuals thus removed. A striking illustration of these points is afforded in a case mentioned by the late Dr. T. A. Murray. He was called upon to visit a poor man in a close alley leading from Shoe-lane, who was ill of typhus-fever. This patient occupied a back room, on the ground floor, together with his wife and five female children, the eldest of whom was sixteen years of age, the youngest two. There was but one bed-lid in the room, but some bedding lay on the floor, between this and the fire-place; it was lighted by one window, which, from its construction, could not be opened. The room, the bedding, and the persons of the inhabitants were all filthy and offensive in the highest degree. It appeared, however, that the mother had been first attacked, in consequence, as she supposed, of having visited a person who died of the fever in one of the upper apartments. She had immediately obtained admission into a hospital, and remained there until she thought herself able to return to her family; though still retaining in her clothes, or person, enough of the contagion to infect them. Soon after her return her husband was attacked by the fever; then the second and third of her daughters; afterwards the eldest and the two youngest. Medicine, as might have been foretold, was of very little service in such a situation. The father of the family died on the fourth day after he was visited. The children continued to linger under the disease, when this report was made. The eldest of them was conveyed to a hospital in a huckerry coach; having, until the time of her removal, lain by the side of her father, on that part of the infected bed which the dead body of their father had previously occupied. See Remarks on the Situation of the Poor in the Metropolis, as Contributing to the Progress of Contagious Diseases, by Dr. Murray, published by the Society for the Benefit of the Poor, in 1821. p. 27.

On contemplating facts like this, and considering the danger then resulting to the public, and the misery inflicted on the families of the poor, we cannot but highly approve the nature of an institution, which has for its object at once the removal of the patients from such pestilential habitations (by means which secure the public), to a House of Recovery, and also the purification of the infected apartments, and the destruction of the contagion, in the clothes and furniture, and whatever else may be imbued with it. Such are the purposes accomplished by the institution of Houses of Recovery; and we shall briefly state the grounds upon which such establishments were proposed, the methods in which they have been executed, and the happy results which have accrued from them.

The first suggestion of the advantages of the establishment in question was made by Dr. Hargrath, at Cheltenham, about the year 1772, from a consideration of the nature of contagion and of the means and limits of its propagation. His own observations, supported by those of Sir John Pringle, Dr. Lind, and others, had taught him that contagious effluvia are particularly active in close and unventilated apartments; but that, in the open air, or when diluted by the free admixture of fresh air into the infected room, they become comparatively inert and harmless, and might be breathed for a long time with perfect impunity; and that even the concentrated infection of a close room might be required for a short time without producing fever, especially at a little distance from the person diseased. It had been shown too, by Dr. O’Ryan’s experiments at Montpellier, that the contagion of small-pox was limited in its operation to the distance of a few feet from the person infected; and by Dr. Ruffell, Dr. Mertens, &c. that even the contagion of the plague was harmless at a similar distance, particularly in the air of well-ventilated places. (See Contagion, where the evidence of these statements is adduced.) In short, Dr. Haygarth was irresistibly led to the conclusion, that contagion is not communicated to any distance through the air, and that, in a well ventilated and clean apartment in a house or hospital, persons affected with contagious fever might be received, without any risk to the occupants of other apartments in the same building, much less to the inhabitants of neighbouring or even adjoining houses. In consequence of these well-founded opinions, a
The fever-ward was opened in the infirmary at Cheltenham, in the year 1773, with the most beneficial effects; i.e. two wards were let apart for the reception of patients labouring under typhus-fever, and were continued open without any injury to the other wards of that hospital, or to the neighbourhood, but with a great diminution of contagious fever in the town.

During the mean time, the attention of the officers of the infirmary was directed to those apartments from which the sick had been removed; the furniture, clothes, &c. which had been about the persons of the patients, were purified, by washing, fumigation, &c. and the rooms cleaned and white-washed. The patients, after their recovery in the fever-wards, were sent home to their families in clean garments; being thus rendered secure from the chance of re-infection on their arrival, and incapable of communicating it to their inmates.

The success of this establishment led to the opening of fever-wards in the infirmary at Liverpool, under the direction of the late Dr. Currie, where the experiment was attended with the same success. The inhabitants of Manchester, from the preceding representations of Dr. Ferris, were induced to form a separate establishment, as already stated, in 1795; and similar houses have been instituted in several of the large towns both in England and Ireland, especially at Dublin, Waterford, Cork, &c. in London, Leeds, and other places; in all of which the principles of Dr. Haygarth have been invariably confirmed, and the most salutary benefits conferred upon the inhabitants.

Regulations of a House of Recovery — The following are the principal regulations adopted in the management of the House of Recovery, in Gray's-inn-lane Road, London, which was opened in 1802, under the patronage of the Society for bettering the Condition of the Poor; they are chiefly taken from those of the establishment at Manchester. See Dr. Ferris, loc. cit. vol. iii. p. 66.

1. The admittance of patients is left entirely to the physician, who, as soon he has ascertained the state of the person recommended, gives an order for that purpose; whence no time is lost by searching for the recommendation of governors, or by stated periods of admittance, as in the ordinary hospitals.

2. A fixed chair, or covered litter, provided with a movable lining, is kept at the house, in which all persons are carried thither at the expense of the institution; so that no public carriages can be thus infected.

3. All patients on admission have their infectious clothes changed for clean linen, and are washed with lukewarm water. The clothes brought into the house with them are properly purified and aired. During their continuance in the house, all linen and bed-clothes, on being removed from the bodies of the patients, are immediately immered in cold water, and all discharges are removed from the wards without delay.

4. The floors of the wards are washed daily near the beds, and twice a week generally; and fumigations with nitre and sulphuric acid are frequently employed; the walls are whitewashed once every three months with quicklime, fresh flaked in water, and while it continues bubbling and hot. The bed-sheets are of brown, without curtains, and the beds fluffed with straw for the convenience of being frequently changed.

5. The fumigation, just mentioned, the efficacy of which in destroying contagion, has been satisfactorily proved by M. Morveau, Dr. Johnstone, and Dr. C. Smyth (see FUMIGATION), is employed in the apartments which the patients have left; their walls are white-washed with hot lime, where that operation is deemed necessary; and such articles of clothing as are not capable of being purified are destroyed, and replaced at the expense of the institution. (See the Reports of the Institution for the Cure and Prevention of Contagious Fever in the Metropolis, Ferriar, Med. Hist. and Rel. vol. iii p. 66.)

The advantages of such institutions have become almost immediately apparent wherever they have been adopted. Great apprehensions were at first entertained (found on popular prejudices and mistakes in regard to the nature of contagion), that the neighbouring dwelling-houses might be infected through the air, where a house of recovery was established. But it was soon perceived that no such infection took place; but, on the contrary, that the neighbourhood of the houses (at Manchester for instance), was the first part of the town to be purified from the contagion which it heretofore cherished. This apprehension was also strongly expressed in London, where the House of Recovery was originally a private dwelling-house, standing in a row, and of course contiguous to dwelling-houses on both sides.

But the experience of nine years has completely removed all the fears of the adjoining inhabitants.

In respect to the establishment at Manchester, it is stated that "the beneficial effects of the House of Recovery are almost beyond belief; the facts are, however, established by authentic documents. The number of fever-patients in the pile of buildings in the neighbourhood of the House of Recovery, for the two preceding years and eight months, were 256, something more than an average of four hundred a year; those in the same district, from July 1796 (a period commencing two months after the establishment of the House of Recovery), to July 1797, being twelve months, were only twenty-six." Again, in January 1796 (before the establishment of the House of Recovery), the whole number of home-patients visited by the physicians of the Manchester Infirmary was 256, of which 226 were cases of fever; in January 1797, the number of their home-patients was 161, and of these only 57 were cases of fever. (See Reports of the Society for bettering the Condition of the Poor.

Both at Manchester and at Dublin (where the number of feverers is much greater, and the establishment upon a more extensive scale), the diminution of fevers has been so great, as to enable those institutions to comprehend a much wider district than in the outset. In London, many of the alleys and courts near Gray's-inn-lane, Saltiron-hill, and other crowded districts, in which contagious fever was generally extant, have been, for several years, since the purifying measures of the House of Recovery were put in execution, altogether free from fever.

Dr. Ferris remarks, while enumerating the benefits derived from these institutions, "I can also perceive, that a salutary impression has been made upon the minds of the poor respecting the utility of cleanliness in their houses. The idea of fever comprehends, among them, that of ruin to their circumstances, and desertion by their neighbours; it may, therefore, be expected, that they will catch at every means within their reach to avoid so dreadful an evil." (Loc. cit.)

Notwithstanding the ample and demonstrative evidence which now exists of the advantages and perfect security with respect to the public, of these institutions, the prejudiced and erroneous notions of the communication of contagion through the air, continue to prevail with great numbers of persons, and to prevent the establishment of fever-wards and houses of recovery. Those who wish for satisfactory proofs upon this subject, may consult Dr. Haygarth's Letter to Dr. Perdvi on the Prevention of Contagious Fevers: Dr. Currie's Reports on the Effects of Water; Dr. Ferris's Med. Hist. and Reflections, vol. ii. and iii.: the Reports of the Houses of
of Recovery of Dublin, London, &c.; and of the Society for bettering the Condition of the Poor. And in the collection of papers (2 vol.) published by Dr Clarke of Newcastle, may be found the almost unanimous opinions upon the utility of each establishment, from a multitude of the most able and respectable physicians and surgeons in the island.

House-in. See Window

House-water, in Mining, is used when steam-engines are employed on mines, or collieries, for the water which is necessary for condensing, which often is obtained at very considerable expense, particularly in deep lead mines, in rocky districts, where the water that is pumped from the bottom of the mine can otherwise be discharged into a fough at a great distance below the surface; in such situations, the high-premature engines of Trevethick, which want no condensing water, have been found very serviceable. At Yateloop, mine, near Whitchurch, in Shropshire, they have several large erected a large steam-engine under ground, on this fough, to avoid the lifting of house-water.

House-wife's Club, is a middle sort of linen cloth between fine and coarse, fit for family use.

HOUSED-IN, is Ship Building. The seaman lay of a ship, which, after the breadth of her bearing is brought in too narrow to her upper-works, that she is housed-in, or pinched too much.

House is also applied to the situation of the great guns of a ship, when they are secured at sea by their tackles and breechings.

HOUSE, in the Mango. See Housing.

HOUSELEEN, in Botany. See Semprevivum.

HOUSELEEN, Letter. See Sedum.

HOUSELEEN, Small Annual. See Tillaea.

HOUSELEEN, Water, of Egypt. See Pistia.

HOUSEHOLD, the family or domestics of a prince, or private person.

The principal officers of the king's household are the lord steward, lord chamberlain, groom of the stole, master of the great wardrobe, and major of the horse.

The civil government of the king's house belongs chiefly to the lord steward of the household, who has an annual salary of £400. He has authority over all officers and servants of the king's house, except those of the chapel, chamber, and stable, who are under the jurisdiction of the lord chamberlain, master of the horse, and dean of the chapel, and he is the judge of all crimes committed within the court, or the verge. See Court.

Under the lord steward are a treasurer of the household, whose place is £200. a-year; comptroller, with the same salary; paymaster, with £500. a-year; maller of the household, at £400. a-year; clerks of the household, assistant clerks, clerks comptrollers, &c.; the officers and servants belonging to the almonry, the marshalled, the verge, the kitchen, gardener, purveyor, &c.

The next principal officer of his majesty's household is the lord chamberlain, whose salary is £100. 4 months, in whose department are the vice-chamberlain, with a salary of £150. 8s. 4d. a-year; secretary and clerks, supervisor, of payments, groom of the stole, with an annual appointment of £200.; lords of the bed-chamber, grooms of the bed-chamber, gentlemen of the privy-chamber, master of the ceremonies with assistent and marshal, gentlemen usher of the privy-chamber, gentlemen usher who are daily waiters, to whom belongs black rod, assistant gentleman usher, grooms of the privy-chamber, gentlemen usher who are quarterly waiters in ordinary, pages of the back stairs, pages of the bed-chamber, master of the robes with groom and clerks, wardrobe-keepers, sergeants at arms, &c. the band of music, the medical department, houfe-keepers, tradesmen, artists, rangers and troopers of the forests, surveyors general of the king's woods, &c. chief justices in Eyre, officers of the royal chapels, chaplains in ordinary, ten priests in ordinary, sixteenth gentlemen of the chapel, royal painters at the king's chapel, Whitehall, organists, &c. subordinate to the master of the horse, whose salary is £160. 13s. 4d. the clerk-martial and first equerry; the equerries, pages of honour, clerk of the records, esquire of the crown, esquire of the crown, and yeomen riders. To the king's hunt belong the major of the flag-hounds, whose annual appointment is £200. a-year; the huntsman, fix yeomen picklers, and grand falconer, whose yearly salary is £200. The military department of the king's household consists of the yeomen of the king's guards, the honourable band of gentlemen-pensioners, and the troops of the household, comprising the horse and foot guards, &c.

Household Days, are four solemn festivals in the year, when the king, after divine service, offers a benediction of gold to God on the altar. See Besant.

The household days are Christmas, Easter, WhitSunday, and All Saints.

The household days are a part of the twelve collar and offering days.

Housing, in Agriculture, a term denoting the twilling or running together of hop-binding above the tops of the poles; by which means great injury is done to the crops.

It is likewise employed to signify the practice of putting of different sorts of live-stock into feds or other covered buildings, in order to protect them during the severity of the winter season.

Housing, or Houset, a cover laid over the saddle of a horse, in order to save it from the weather, dirt, &c.

The word is formed of the French houfle, which signifies the same thing; though it anciently denoted a kind of houset worn by country people.

The cavaliers appeared with their embroidered housings.

Housing, Boot, is a piece of stuff fastened to the hinder part of the saddle that covers a horse's croup; either for the sake of ornament to hide the horse's leannees, or to save the clothes of the rider from being daubed and foiled by the sweat of the horse.

Housing, Sboe, is a piece of cloth bordered with a fringe, oftentimes put round the saddle to cover the croup, and hang down to the lower part of the belly, to save the rockings of those who ride without boots.

Housing, among Bricklayers, a term used for a brick which is warped, or is cast crooked or hollow in burning; in such a cafe, they say it is housing.

Housing, or House-line, in Sea Language, denotes a small line formed of three fine strands or twills of hemp, smaller than rope-vine. It is chiefly used to seize blocks into their supports, to bind the corners of the sails, or to fall the bottom of a sail to its bolt-ropes, &c.

HOUSSA, in Geography, a country of Africa, lying N. and S. of the Niger, or Neel-Abeed, and placed in major Rennell's map of Africa S. of the Great Desert, or Sahara, and between Tromburto on the W., and Toucrur on the E., in lat. from about 15° to 17° 30', and E. long. from about 32° to 5°. The inhabitants, according to the account which Mr. Horneman received of them, are negroes, but not quite black; they are distinguished from their neighbours by an interesting countenance, and are represented as the most intelligent people in the interior of Africa; their stature is less disagreeable than that of the negroes, and they are much addicted to pleasure, dancing, and singing. Their disposition is benevolent and mild. They are described as indulgent.
diffusious and skilful in the culture of the natural productions of their country, and in this respect they excel the Fezzanese, who obtain their clothes and household implements from them. Their music, compared with that of the Europeans, is imperfect, but the Houffanian women possess musical powers sufficient to produce tears from their husbands, and to inflame their courage to the greatest fury against their enemies. The capital of this country is Houfia, situated in Remell’s map, in N. lat. 16° 30’. E. long. 4° 30’. It lies at a small distance N. from Nejd-Abeed. Mr. Park was informed by a there, whom he met with at Benoum, and who had travelled through a number of kingdoms, that he had visited Houffia, and that it was the largest town he had ever seen. Mr. Park was also informed by others, that of the chief towns of Jenne, Tombuctoo, and Houfia, situated on or near the banks of the Niger, the last was the most considerable, and that the heat of them was much larger than Sego. He was further told, that caravans frequently arrive both at Tombuctoo and Houfia, from the countries on the Mediterranean, travelling across the Defert by the way of Fezzan, with European goods and other merchandise.

HOUSTONIA, in Botany, named by Grenovius and Linnaeus after Dr. William Houston, P.R.S., who received several years ago the West Indies, and visited the Spanish main, from whence he sent various seeds to Miller and other botanists of that time, between the years 1758 and 3732, besides making several curious observations upon Contraversy, Jalap, and other medicinal plants. He died in Jamaica in 1732. Some engravings, by his own hand, of the parts of fructification of various new genera of plants, in the manner of Plumer, came into Miller’s hands, who lent an impression of them, in 1736, to Linnaeus. Most of these plates were purchased, with Miller’s herbarium and papers, by Sir Joseph Banks, who printed and liberally distributed an edition of them, with the Latin descriptions and remarks of the author, under the title of Reliquiae Houstonianae, in quarto, in 1781. A few of the plates were re-engraved, after impressions of some that had been lost.

Gen. Ch. Cal. Perianth half superior, of four small, upright, permanent teeth. Cor. of one petal, funnel-shaped; tube much longer than the calyx, cylindrical, slightly dilated at the top; limb in four deep, rounded or elliptical, spreading segments. Stam. Filaments four, in the neck of the tube, very small; anthers simple. Pfl. Germin half inferior, rounded, two-lobed, compressed; style simple, shorter than the tube; stigma small, acute. Peric. Capsule in the bottom of the calyx, surrounded by its teeth, rounded, didymous, bursling at the top transversely, of two cells, and two valves which are contrary to the partition. Seeds few, small, oval, attached to the partition.

Obf. Linnaeus appears, as Gartner remarks, to have mistook the receptacle covered with seeds for one single seed, owing probably to the unripe state in which he saw it.

Bay close to Simon’s bay; and the former, by another doile, with the great road leading from Cape Town to Simon’s bay. Hout bay affords safe and convenient anchorage for eight or ten ships; and has a rivulet of fresh water falling into it from the back part of Table mountain; but the getting out of the bay is supposed to be very difficult and precarious, on account of the eddy winds from the surrounding mountains when they are moderate in the offing, or from the south-easterly winds setting into the entrance, as well as from the constant westerly swell and wind prevailing from that quarter in the winter season. Hout bay is now defended with a battery and a blockhouse.

HOUT-TEHOU, a city of China, of the first rank, in the province of Tche-kiaung, is situated on a lake from which it takes its name. The quantity of silk manufactured here is almost incredible; and it is also the chief place in China for making writing pencils. Its district contains seven cities, one of which is of the second, and six of the third class. N. lat. 30° 53’. E. long. 119° 32’.

HOUTEVILLE, CLAUDE FRANCIS, in Biography, was born at Paris in 1668. He became a member and secretary of the French academy, and secretary to cardinal Dubois, whose friendship obtained for him the abbey of St. Vincent du Bourg-lur-mer, in the diocese of Bourdeaux. This was in the year 1723, and in the same year he was admitted a member of the French academy. He died in 1744, aged 54. His principal work is entitled “The Truth of the Christian Religion proved by Facts,” three vols. 4to.

Gen. Ch. Col. Spatha of four ovate, concave, obtuse, spreading leaves; spadix about as long as the spatha, oblong, covered with flowers; panicle none. Cor. none. Stem filaments generally seven, short, equal; another vertical, ovate, two-lobed. P. bt. Germen roundish, somewhat triangular; styles three, awl-shaped, short; figmas recurved, acute, downy on the upper side.—Frucht unvollständig.

H. cordata. Thunb. Jap. 234. t. 26. Doku Damo, or Syjunie, of the Japanese. Found by Thunberg, very abundantly, in ditches by the waysides, and about towns, between Mino and Jedo in Japan, flowering in May and June. The root is fibrous and annual. Stem herbaceous, erect, from a span to a foot high, simple, or slightly branched, rather zigzag, furrowed, leafy, scarcely downy; its lower joints throwing out numerous whirled fibres. Leaves alternate, stalked, heart-shaped, broad, pointed, entire, veiny, smooth, finely dotted; pale beneath. Stipulae roundish, united to the footstalks and clasping the stem. Flowers few, stalked, solitary, opposite to some of the upper leaves. Leaves of the involucre white, rather above half an inch long. Flowers purplish, with yellow anthers.

One of professor Thunberg’s own specimens, (indeed no other botanist, as far as we know, has gathered the plant) flows very plainly the three recurved figmas, with the stile, in each flower, and has enabled us to correct the character and classification of the genus. The Houttuynia seems to occupy in Japan the place of our Sagittaria, to which its flowers bear a not very remote resemblance, however different in botanical characters. The leaves look somewhat like those of Arthrobis Olandtii.

HOW, in Agriculture, a term which frequently denotes a small round hilllock, or small hill of the artificial kind.

How, in Geography, a town of Poland, in the palatinate of Lencie; 32 miles N.E. of Lencie.

HOWAN SOUND, a flaw of the sea, between the islands of Eglitha and Rowfa, two of the Orkney islands.

HOWARD, THOMAS, in Biography, Earl of Surrey, and duke of Norfolk, an eminent commander in the reign of Henry VIII., was born in 1473. He was brought up to arms, and soon after the accession of Henry was decorated with the knighthood of the garter. He served with his brother Sir Edw., against Sir Andrew Barton, a Scotch free-booter, or pirate, who perished in the action. When his brother, Sir Edw., was killed in an action near Breil, in 1513, he was appointed to the office in his stead, and in the capacity of high admiral he effectually cleared the channel of French cruisers. The victory of Flodden-field, in which the king of Scotland was slain, was chiefly owing to his valour and good conduct. For this his father was restored to the title of duke of Norfolk, and the title of earl of Surrey was conferred on him. In 1521 he was sent to Ireland as lord-lieutenant, chiefly for the purpose, it was thought, of having him out of the way during the proceedings against his father-in-law, the duke of Buckingham. Here he was very instrumental in suppressing the rebellion, and having served there two years, he returned, and had the command of the fleet against France. By the death of his father, he succeeded to the title and estates as duke of Norfolk. Notwithstanding his great services, Henry, at the close of his royalised life and reign, caused the duke to be sent to the Tower on a charge of high treason, and his son to be beheaded in his presence. The death of the king faved the duke’s life. (See Henry VIII.) He was, however, detained prisoner during the whole of the reign of Edward VI., but one of the first acts of Mary, after her accession to the throne, was to liberate this faithful servant of her late father. He was, after this, the principal instrument in suppressing the rebellion excited by Sir Thomas Wyatt. He died in August 1554, having passed his eighteenth year. Hume’s Hill.

HOWARD, HENRY, earl of Surrey, son of the preceding, a nobleman of considerable accomplishments, and one of the early English poets, was born about the year 1520. In his youth, he resided at Windsor as companion to the young duke of Richmond, natural son to Henry VIII., whom he afterwards accompanied to Wofford’s new college at Oxford. He then made the tour of Europe, under the impulsion of a romantic passion for the daughter of the earl of Kildare, whom he characterizes with the epithet of “Fair Geraldine.” In the spirit of chivalry, he published at Florence a general challenge at tilting to all persons who should dispute the supremacy of her beauty. He came off victorious, and as a reward, was presented with a shield by the grand duke of Tuscany. On his return to England, about 1541, he was decorated with the order of the garter. In 1542 he acted as lieutenant-general in the army with which his father invaded Scotland. He accompanied the king in his expedition to France in 1544, and was field-marshal of the army before Boulogne. After serving his country with great valor, he fell
fell a victim to the jealousy of Henry VIII., who pretended to  
select him of a design to marry his daughter Mary. He  
and his father, as we have already seen, were sent to the  
Tower, and the son was beheaded on Tower-hill, in the year  
1547, leaving behind him two sons and three daughters. His  
sonnets are printed in Anderson’s collection of British Poets.  
His eldest son, Thomas, was the Duke of Norfolk, who was  
so conspicuous in the reign of Elizabeth for his negotiations  
with Mary, queen of Scots, terminating in his ruin. The  
earl of Surrey translated the second and fourth books of  
Virgil’s Æneid, which were published in 1557. According to  
Warton, “Surrey, for juxtae of thought, correctness of style,  
and purity of expression, may justly be pronounced the  
first English classical poet.”

Howard, Charles, lord Effingham, and earl of Nottingham,  
a distinguished naval commander, was born in 1536;  
his son, William of Effingham, and grandson to  
Thomas, second Duke of Norfolk. In his youth he served  
in several expeditions under his father, then lord-admiral,  
and, in 1559, he was sent as ambassador to France, and after  
his return he was elected knight of the shire for Surrey. In  
1568 he was appointed general of the horse. The same year  
he displayed great valour in the north, against the rebels  
commanded by the Earl of Northumberland and Westmoreland.  
The following year he had the command of a large force with  
which he escorted, from Zeland to Spain, Anne of Auvernia,  
daughter of the emperor Maximilian, who was betrothed to  
Philip of Spain. In 1572 he succeeded his father as lord  
Effingham, and not long after was made knight of the garter.  
He had, as we have seen in some preceding articles, the  
important command of the English fleet when the Spanish  
Armada entered the channel, and by his great skill and  
prudence contributed principally to its destruction. For this  
important service he was created earl of Nottingham, and  
enjoyed the queen’s confidence to her death. (See Elizabeth.)  
In the rebellion excited by the Earl of Essex, lord Nottingham  
commanded the force which invested Essex-house, and brought  
him to submission. At the coronation of king James,  
the earl officiated as lord high-steward, and he was soon after  
appointed ambassador to the court of Spain. His last service  
in the capacity of admiral, was the conveying to Flushing  
of the princes Elizabeth, married in 1613 to the elector  
Palatine. After his return, he lost the king’s favour, and  
resigned the post to the Duke of Buckingham. He died in  

Howard, for Robert, an English writer, was the son of  
Thomas, earl of Berkshire, and educated at Magdalen  
College, Oxford. He suffered considerable losses during the  
civil wars, but at the restoration he was knighted, and made  
judge of the exchequer. He was a zealous friend of the  
Revolution, and died about the year 1700. As an author,  
he wrote several plays; the History of the Reigns of Edward  
and Richard II.; the History of Religion, 1654.

Howard, John, born at Hackney, or Engfield, in 1729,  
was son of a carpet-warehouseman, and Upholsterer in  
London. The father died during the infancy of his son, who  
was left in the hands of guardians, by whom he was apprenticed  
as an upholsterer. He did not serve his time out, but bought  
his indentures, and indulged his curiosity in a tour to France and  
Italy. Upon his return, he fell into a weakly state of health,  
which, with his attachment to reading and the study of  
nature, induced him to withdraw into privacy in the country.  
From a motive of gratitude, he married the perton with whom  
he lodged, and who had carefully attended him, though she  
was sickly, and twice his age, and even remonstrated against  
the inequality of such an union. He palled three years with  
her in conjugal harmony, and upon her death, in 1756, sat out  
upon another tour to the continent. In this, his leading  
object was to view the ruins of Lisbon, lately desolated by an  
atmospheric. He was defeated in his plan by the capture of  
the vessel in which he failed, and by being carried a prisoner  
into France. The sufferings which he underwent, and to  
which he was witness in others, made a deep impression on  
his mind; this was probably the principal cause of the  
philanthropical exertions which afterwards employed so large  
a portion of his life. Upon his liberation, he laid the plate of  
his fellows-sufferers before the commissioners of the sick and  
wounded, who received his information with gratitude. In  
1758 he married the eldest daughter of Mr. Serjeant Leeds,  
of Croxton, Cambridgeshire. His principal residence for  
some years was at Cardington, near Bedford, where he put  
in practice those schemes for the good of the poor neighbours  
and tenants, in which he ever took delight. He built  
upon his estate a number of very neat and comfortable  
cottages, to each of which he annexed a little ground for a  
broken. These he peopled with sober and industrious  
tenants, over whose welfare he watched with the vigilance of  
a parent. In 1765 his domestic happiness was irreparably  
injured by the death of his wife, soon after she had borne him  
her only child. The care of his son and his usual benevolent  
objectives centering in employing him till the year 1775,  
when he was selected to serve the office of high-sheriff for  
the county of Bedford. In the course of his official duties  
he found that a multitude of abuses prevailed, which he knew  
not how to remedy; he determined, however, to obtain every  
possible information on the subject. He began by visiting  
most of the county gaols in England; and on a second  
journey he extended his researches into town-prison and  
houses of correction, and so diligently did he pursue his ob-  
ject, that he was enabled, in the month of March 1774, to  
lay before the house of commons a large mass of information  
for which he received the public thanks, and on the credit of  
his testimony, two bills were passed during the same session  
of parliament, one, “For the Relief of acquitted Prisoners  
in Matters of Fees”; the other, “For preferring the  
Health of Prisoners.” The heads of these bills, with the  
several regulations contained in them, Mr. Howard procured  
to be printed, and sent to every keeper of a gaol throughout  
England. He now felt the high importance of the business  
in which he had engaged, and resolved to devote himself  
and his fortune to the improvement of this part of civil polity.  
With this view he made two tours on the continent, travelled  
to Scotland and Ireland, and the fruit of his researches was  
given to the public in 1777, under the title of “The State  
of the Prisoners in England and Wales, with Preliminary  
Observations, and an Account of some Foreign Prisons.” As  
soon as this work appeared, the world was aminated at the  
views of valuable materials accumulated by a private, unnamed  
disciple, through a course of prodigious labour, and at the  
consequent hazard of his life, in consequence of the infectious  
diseases prevalent in the scenes of his inquiries. He was  
from this moment, looked on as one of the extraordinary  
characters of the age, raised up by providence for the  
purpose of meliorating the condition of that wretched part of  
the community for whom he interested himself. He was  
anxious to correct their vices, which he thought would be  
best effected by gentle and strict discipline, accompanied  
with all the comforts of which their wretched situation was  
unfleece. His zeal was seconded by the exertions of  
parliment, and a bill was brought in for the establishment of  
houses of correction, according to his ideas. He now made  
another tour on the continent, and took a still more accurate  
view of all the prisons in every part of England, Wales,  
Scotland, and Ireland, including in his observations whatever  
related
belonged to hospitals. He every where noted down the structure and regulations of these several kinds of buildings, and procured plans and draughts where he thought they might suggest something useful for imitation. These researches furnished him with materials for an appendix to his former work, which was printed in the year 1780. About this period he accepted the office of one of the three supervisors appointed for establishing penitentiary houses. He made it a condition of his acceptance that Dr. Fothergill should be one of his associates, but the death of the doctor, and some difference of opinion concerning the situation of the site of these buildings, caused him, in 1781, to resign his office, but it was only for his far greater exertions in the same noble cause. He travelled through the whole of the northern kingdoms of Europe, and revisited the prisons of his own country; he seemed resolved to take no repose while anything remained in which he thought his farther labours might serve the interests of humanity. The progress of contagion, in prisons and hospitals, had led him to consider all the means useful for checking it, and he expected to find these practised in their full extent in the prevention of the plague; he therefore resolved to examine all the lazarettos in Europe. Personal risk never, in his estimation, stood in the way of duty: he did not hesitate to expose himself to all the dangers which attended those who approach the most alarming pestilence. He set out in 1785, accompanied by a servant, but this time without the protection of his more elevated interlocutors to guard against the dangers which, for the public good, he was willing to undergo. He took his way by the south of France, through Italy, to Malta, Zante, Smyrna, and Constantinople. From the last named city he returned to Smyrna, where he knew the plague then prevailed, for the express purpose of going to Venice with a "Foul Bill," as it is called, that he might be subjected to all the rigour of a quarantine in a lazaretto, in order that he might practically know its rules. Such an enterprising and heroic conduct in the great cause of humanity excited the attention of almost every thinking individual of Europe. On his return by Vienna, the emperor Joseph expressed a desire of seeing him: the interview passed as between an enlightened sovereign desirous of information, and a man independent gentleman, above the awe of rank or the vanity of being noticed. During his absence on this journey, a subscription was entered into for the purpose of erecting a statue, and it was soon filled with names of the first distinction. As soon as he heard of the scheme, he expressed such a decided averton from what he denominated being "dragged out in public," that it was reluctantly abandoned. On his return he revisited once more the prisons, workhouses, and lazarettos of his own country, which occupied his attention during the course of two years. The year 1789 was chiefly devoted by him to the methodizing and printing the important matter which he had collected since his last publication. This appeared in a quarto volume, entitled "An Account of the principal Lazarettos in Europe, with various Papers relative to the Plague, &c." At the close of this publication he declared his intention of again quitting his native country, for the purpose of revisiting Russia and Turkey, and extending his travels in the East. He quitted England in the summer of 1789, and proceeded through Germany, to Petersburg and Moscow; at all places the prisons and hospitals were thrown open to him, as if the governments of the earth were ready to second his humane and benevolent designs, and hailed his presence as that of a general censor of that part of the police, whose authority was recognized in every civilised country. He next proceeded to the new Russian settlements on the Black sea, and took his station at the town of Cherson.

At this place a fever of a most malignant kind prevailed; among the victims of which was a young lady whom he had been requested to visit, being supposed to possess medical skill of a superior kind in those cafes. From her he probably received the contagion which carried him off on the 20th of January 1790, about the age of sixty-three. He was buried in the neighbourhood of Cherson, and all honours were paid to his memory by prince Potemkin and other men in office. For a more full and very interesting account of this gentleman, who has been frequently characterized, and justly so, as "The noblest of all the Howards," the reader is referred to Dr. Aikin's "View of the Character and Public Services of the late John Howard, eq. LL. D. F. R. S." 1792. Dr. Aikin expresses himself in the following terms in the General Biography: "The bare recital of what Mr. Howard did in the cause of humanity, is sufficient to place him among the greatest benefactors of mankind, as well as the most extraordinary private characters recorded in biography. He was, indeed, singularly calculated for the task which he undertook. Accustomed to the most rigorous temperance, so as to discard from his diet animal food and fermented liquors, he found no difficulty in living in the poorest countries. In all other respects his mind was equally matter of his body, and he incurred hardships of every kind without repugnance. In temper he was calm and resolute, but firm and resolute; proof against every allurement or intimidation that might divert him from his purpose. Economical in private expenses, he knew no bounds in his expenditure on objects of public utility, and regarded money only as an instrument of beneficence. In honour, integrity, and attachment to principles, he was not surpassed by any human being. His talents were rather of the useful than the shining kind, but peculiarly adapted for that collection of facts and observations in which he employed himself. The testimony of public respect which he refuted when living, has been conferred upon his memory, and his monumental statue was one of the first of those by which the cathedral of St. Paul's has been made a receptacle of national worthies."

We cannot close this article without subjoining the eloquent eulogium pronounced upon Mr. Howard, by Mr. Burke in his "Speech at Bristol, previous to the election in 1780." Having occasion to mention him, he adds, "I cannot name this gentleman without remarking, that his labours and writings have done much to open the eyes and hearts of mankind. He has visited all Europe,—not to survey the fumptuosity of palaces, or the flatlairs of temples; not to make accurate measurements of the remains of ancient grandeur, nor to form a scale of the curiosity of modern art; not to collect medals, or collate manuscripts;—but to dive into the depths of dungeons; to plunge into the infection of hospitals; to survey the maimings of forrow and pain; to take the gage and dimensions of misery, dejection, and contempt; to remember the forgotten, to attend to the neglected, to visit the forlorn, and to compare and collate the distresses of all men in all countries. His plan is original; and it is as full of genius as it is of humanity. It was a voyage of discovery; a circumnavigation of charity. Already the benefits of his labour are felt more or less in every country; I hope he will anticipate his final reward, by seeing all its effects fully realized in his own. He will receive not by retail, but in gros, the reward of those who visit the prisoner; and he has foreclosed and monopolized this branch of charity, that there will be, I trust, little room to merit by such acts of benevolence hereafter."

Howard, Samuel, brought up in the king's chapel,
took his degree of doctor of music at Cambridge at the time of the installation of the duke of Grafton as chancellor of that university. Dr. Howard had studied much under Dr. Pepusch at the Charter-house, and was well acquainted with the mechanical rules of counterpoint. His overture in the "Amorous Goddess," a happy imitation of Handel's overture in "Alcina," particularly the muflute and minuet, was long very popular in the theatres and public gardens. But his ballads, which were long the delight of natural and inexperienced lovers of music, had the merit of facility; for this honest Englishman preferred the style of his own country to that of any other so much, that he never flagged in his belief of its being the best in the world, by listening to foreign artists or their productions, for whom and for which he had an invincible aversion.

He began to flourish about the year 1740, and from that time till Arne's Vauxhall songs were published under the title of "Lyric Harmony," they were the most natural and pleasing which our country could boast.

After the decease of Michael Christian Felting, Dr. Howard took the lead in managing the affairs of the musical fund; but not with equal address and intelligence.

He was a dull, vulgar, and unpleasant man; and by overrating his own importance, and reigning paramount over his equals, he rendered the monthly meetings disagreeable, and cooled the zeal of many well-thiners to the society.

He being labourd under a droopy, yet walked about with legs of an enormous size, during several years. But it was not this disorder which put an end to his existence, at last, but repeated paralytic strokes. He died about the year 1783.

Howard's Point, in Geography, a cape on the N. W. coast of the island of Egmont, or New Guerney. S. lat. 10° 42'. E. long. 164° 18'.

Howard, a township of America, in the county of Suffolk, Upper Canada, W. of Oxford; watered on the N. by the Thames and on the S. by Lake Erie.

HOWASSE, a town of Hindoostan, in Malwa; 10 miles N.E. of Tandia.

HOWDEN, also called Hoveden, a market town in the division of Howdenshire, in the East Riding of the county of York, England, is 25 miles N.E. of the city of York, 25 W. of Hull, and 184 N. of London. In the year 1801 the town contained 325 houses and 1352 inhabitants. In the reign of Edward the Confessor this town, with the church and lands around it, belonged to the monastery of Peterborough. William the Conqueror, however, seized them, and gave the whole to the bishop of Durham; in consequence of which the bishop built a palace here. And some of them made it their principal residence. The following prelates died here: Hugh Padley in 1195; Walter de Kirkham in 1260; and Walter de Skirlaw in 1405. Le-land describes the bishop's palace as built partly of timber and partly of brick and stone. What remains is now converted into a farm house, near which are the ruins of several large buildings, and a long range of granaries. King Henry III. granted the bishop the following privileges attached to this manor: the goods of all persons who committed felony-de-fe; of wrecks cast on the shores of the Ouse; of tollage and laitage; of having a clerk of the market; and a corne, &c. This town has been much improved lately, in the erection of new buildings, paving the streets, and in other respects. In the market place is a large edifice called the Moot-hall; in which is the council house, a place for keeping courts. The bishops of Durham are required by ancient custom to maintain a bull-ring in the market place, and to provide ropes for securing the bulls when baited. In the year 1791 a large work-house was built here by subscription. The Domusday survey notices a church at the place; but the present building is of different ages. The tower was built by bishop Skirlaw about the year 1299, and the same prelate also erected a chapter-house on the south side of the choir. This church is collegiate, and is built in a cruciform shape, with a nave, transepts at the eastern end, and a chancel, tower in the centre. It displays some interesting specimens of ancient ecclesiastical architecture. It is much to be regretted that the inhabitants have suffered the elegant chapter-house to fall in ruins: and the chancel part is also in a shameful dilapidated state. Here are a weekly market on Saturdays, and five annual fairs, one of which, commencing on the 25th of September, ending on the 3d of October, is considered the greatest mart for horses in England. In the parish are two chapels of ease, one at Barmley, and the other at Laxton. A chapel for Methodists, and another for Independents, are established here. This place gave birth to Roger of Howden, who was monk of the abbey. Savage's History of Howden Church, 12mo. 1799, and Hutchinson's History, &c. of Durham.

HOWE, John, in Geography, a learned English nonconformist, was born at Loughton, in Leicestershire, in the year 1630. His father, who was minister of the place, being ejected by archbishop Laud, on account of connecting himself with the Puritans, removed with his son to Ireland, where they continued, till the rebellion in that country obliged them to return to England, when they settled in Leicestershire. The son received a good classical education, and was sent at an early age to Chrift's college, Cambridge. He continued at Cambridge till he took his degree of B. A., and then removed to Oxford, where he was appointed bible-clerk of Brazen-Nose college in 1643.

In this situation he so distinguished himself in learning and piety, that he was elected fellow of Magdalen college. In 1652 or 3, he became a preacher, and was ordained at the church of Winwick, Leicestershire, after which he was chosen minister of Great Tarrington in Devonshire, where he discharged the functions of his office in the most exemplary manner. Having occasion to take a journey to London, he went as a hearer to the chapel at Whitehall. Cromwell was present, and, with his deponent and perfon, sent a messenger to inform him that he wished to speak with him when the service was over. In the course of the interview he desired him to preach before him the following Sunday: he requested to be excused: the protector would not be denied, and even undertook to write to his congregation a sufficient apology for his absence from them longer than he intended. This led to the appointment of Mr. Howe to the office of his domical chaplan, and he accordingly removed with his family to Whitehall. He was soon appointed lecturer of St. Margaret's church, Westminster, where he was much admired and followed as a preacher.

In this situation of importance and influence Mr. Howe embraced every occasion that offered of promoting the interest of religion and learning, and was always ready to do kind offices to men of merit among the royalists. He was so zealous in behalf of the interests of others, that Cromwell once asked him if he never meant to think of himself; "I wonder," says he, "when the time is to come, that you will move for any thing for yourself, or your family." To some of the peculiar notions of Cromwell Mr. Howe could not assent, and in one particular instance he thought it right to preach against them in his presence, because he believed they might lead to præfetical ill consequences. The friends of the preacher were alarmed for him, and one of them predicted, that he would find it difficult.
difficult, if not impossible, to regain his favour. "I have," said the worthy man, "discharged my conscience, and the event must be left to God." From this period the friendship of Cromwell was very ascendant, and his manners cool and reserved, but he never mentioned the subject to him. Upon the death of Oliver, he was continued by his son Richard in the same situation, as domicil chaplain at Whitehall, and upon the deposition of Richard, he returned to his people at Torrington. In 1662, he was ejected from his living under the act of Uniformity; but after he had been dismissed by the law, he continued to preach occasionally in the private houses of his friends and acquaintance, till a process was taken out against him. He was summoned before the bishop of Exeter, who did what he could, as a friend, to persuade him to conform, but when he found that his admonitions were in vain, the prelate dismissed him with strong assurances of his continued regard. In 1671, Mr. Howe removed to Ireland, to become chaplain to lord Maffarene, who lived at Antrim, by whom he was received and treated with great respect and attention. On account of his learning, and true Christian temper, he acquired the particular friendship of the bishop of Antrim, who, together with his metropolitan, gave him leave to preach in the parish church every Sunday in the afternoons without facing conformity. In the year 1683, the Difenters being cruelly persecuted in every corner of the kingdom, Mr. Howe accepted of an invitation from lord Wharton to accompany him on his travels into foreign countries. During these travels he had the satisfaction of seeing most parts of Europe, and of conversing freely, not only with a number of learned Papists, but several eminent Protestant divines, both Lutherans and Calvinists. In 1686, he settled at Utrecht, where he took his turn in preaching at the English church in the city, and affixed the English students in the university, by his instruction and advice in the prosecution of their studies. Here he became acquainted with several eminent personages of his own country, and among others with Dr. Burnet, afterwards bishop of Salisbury, with whom he was accustomed to speak freely upon a variety of topics. In a conversation they once had respecting non-conformity, Dr. Burnet told him that it would not last long; but that when Mr. Baxter, Dr. Bates, and himself (Mr. Howe) were laid in their graves, it would sink and come to nothing. Mr. Howe said it could not be so, because it did not depend on person but principles, which, when adopted on grounds approved of after serious, and sincere enquiry, would not be laid aside by men of conscience. While he continued in Holland, Mr. Howe was admitted to frequent audiences by the prince of Orange, afterwards king William III. of England, who always maintained a sincere respect for him. Mr. Howe returned home in 1687 upon the king James's declaration for liberty of conscience, but learly was he quietly settled when he was called on by his brethren to consider what was to be done in that crisis, and he without hesitation gave his opinion against the king's dispensing power. After the Revolution he discharged the duties of his pastoral office with unwearied diligence, labouring most zealously to promote the interests of real practical religion, and to diffuse a spirit of candour, charity, and mutual forbearance, among his diffenting brethren. He died in 1705, when he had nearly completed his seventy-fifth year. Mr. Howe was a person of distinguished piety and virtue, of eminent intellectual endowments, and of extensive learning. According to Granger, "He was one of the most learned and polite writers among the Difenters. His reading in divinity was very extensive; he was a good Orientalist, and understood several of the modern languages." His works are numerous and truly excellent; the whole have been collected and printed in two volumes folio, 1724, with a life of the author prefixed, to which the reader is referred for more particulars than can be given in this article. Perhaps the principal of his pieces are "The Blessings of the Righteous laid open," and "The Living Temple: or a Designed Improvement of that Notion that a Good Man is the Temple of God." Bis. Brit. Neil's History of the Puritans.

HOWE, Richard, Earl, born in 1755, was the second son of lord viscount Howe. He was educated at Eton, which he left when he was only fourteen years of age, to enter the service of his country on board the Severn, commanded by the honourable captain Legge, which made a part of commodore Anson's squadron defined for the south seas. At twenty years of age he was appointed to the command of a fleet of war; in this he beat off two large French frigates after a gallant action, for which he was made post-captain. He was now appointed to a frigate, and afterwards made captain of admiral Knowle's own ship of eighty guns in Jamaica, with which, at the peace in 1748, he returned to England. On the renewal of the war he was appointed to the Dunkirk of sixty guns, making part of admiral Boscawen's squadron, and he captured, off Newfoundland, the Alcide French man-of-war of fifty-four guns. In 1757, he sailed under admiral Hawke, and in the following year was appointed commodore of a squadron, with which he destroyed a number of ships and magazines at St. Malo. Prince Edward, afterwards duke of York, served on board his ship, and on the tenth of August, of the same year, he took Cherbourg, and destroyed the bason. About this time, by the death of his brother, he became lord Howe, and shortly after had a considerable share in the victory over the French fleet commanded by Conflans. When admiral Hawke presented him to the king, his majesty said, "Your life, my lord, has been one continued series of services to your country." On the return of peace he was appointed a lord of the admiralty, and afterwards treasurer of the navy. In 1770 he was promoted to the rank of rear-admiral of the blue and commander-in-chief in the Mediterranean. In 1775 he rose in succession to vice-admiral of the blue; at this time, lord Hawke gave the following feaman-like testimonio to his merit in the house of lords, "I advised his majesty," said he, "to make the promotion, I have tried my lord Howe on important occasions: he never asked me how he was to execute any service, but always went and performed it." In the contest with America, it was the policy of minillers to employ, in high commands, officers whose public principles had led them to be favourites of popular rights, and the opposers of coercive measures. Among these none found higher than lord Howe, and his brother the general. These, by embarking in the cause, were probably actuated with the persuasion that they could settle the difficulties without having recourse to the sword. Lord Howe went out with limited instructions, and every attempt at pacific measures proved to be in vain. He was now obliged, by his naval character, to follow such a plan as would do honour to his profession. When the French joined the American cause, lord Howe had an opportunity of exhibiting his great talents as a commander; in 1778, through the intention of the administration, he was left with a force very inferior to that of the enemy, and the English fleet was brought into a situation of much danger, but by the skilful exertion of his lordship, the French thought prudent to pull away, without putting their strength to a trial. The enemy's fleet now invested Rhode Island, but by the manœuvres of lord Howe its plans were again defeated. Disguiled, probably, with the cause in which he never cordially
dially embarked, and detracting the principles of an administration who were deacons of destroying the rights of their countrymen across the Atlantic, lord Howe resigned in 1778, and remained unemployed till 1782, when, upon the change of administration, he was advanced to the rank of admiral of the blue, created a vice-admiral of Great Britain, and appointed to the command of a fleet fitted out for the relief of Gibraltar, which he performed in the teeth of the combined fleets of France and Spain, who shunned an action, though far superior in force and numbers. At the conclusion of the war he was made first lord of the admiralty, an office which he held with a short intermission by a change of administration, till 1788, when he was created an English earl. In 1793, when the war with France broke out, his lordship, at the king's particular desire, accepted the command of the channel fleet, and on the glorious 1st of June, as it is now called, he obtained a most decisive victory over the French Fleet, took seven men of war, and rendered the others incapable of farther opposition. On the part of the British not a ship was destroyed, or taken, or even much injured, and this vast success was obtained with the loss of but few men, though the slaughter among the enemy's crews was very great. The gratitude and enthusiasm of the nation was proportioned to the importance of the service, and the 1st of June is confiaged, by the epitaph already noticed, to futurity, among the most splendid days of our national calendar. In 1795 lord Howe was appointed general of the marines, and in 1797 he resigned his naval command, and was decorated with the order of the garter. His lordship died in 1799, at the age of seventy-three, having served his country with the highest reputation for a long period of almost three-score years. Lord Howe was ever distinguished by cool and steady valour, sound judgment, and consummate seamanship. Month. Mag. Gent. Mag.

Howe, The, in Geography, a small island in the English channel, near the N.W. coast of the island of Guernsey.

Howe's Foreland, the northern point of a peninsula on the N.E. coast of Kerguelen's land. S. lat. 48° 48'. E. long. 69° 28'.

Howe's Island, an island in the South Pacific ocean. S. lat. 31° 36'. W. long. 159° 4'.

Howe's Island, an island in the South Pacific ocean, discovered by Captain Wallis in 1767, on which a few coconut trees were growing. It is about ten miles long and four broad. S. lat. 16° 46'. W. long. 154° 8'.

Captain Cook observed it in his passage from Uliette to the Friendly islands, in 1774, and found it to be a small reef-island of a circular form, about four leagues in compass, composed of several small patches connected by breakers, the largest lying on the N.E. part. It appeared to have no inhabitants.

Howe's, or Lord Howe's Island, one of the chaffers, called Queen Charlotte's islands, separated from Egmont island by a passage extending about 11 leagues, and about four miles broad. Lord Howe's island lies in S. lat. 11° 10'. E. long. 164° 43'.

Cape Byron, the N. E. point of Egmont island, in S. lat. 16° 40'. E. long. 164° 49'.

Both these islands appear to be fertile, and have a pleasant appearance, being covered with tall trees of a beautiful verdure. The inhabitants of Egmont island are extremely nimble, vigorous, and active, and seem to be almost as well qualified to live in the water as upon the land, as they were in and out of their canoes almost every minute.

Howe's Sound, a bay or inlet in the gulf of Georgia. The entrance is in N. lat. 49° 23'. E. long. 237'.

HOWELL, James, in Biography born in Carmarthenshire about 1596, was educated at Jesus College, Oxford, and at the close of his studies he came to London to seek employment, being unable, through frightened circumstances, to remain at the university the usual period. Through the interest of sir Robert Mansel he was appointed steward to a patent glass manufactory, it being requisite to send an agent abroad to procure the best materials and workmen. He left England in 1619, and visited many commercial towns in Holland, Flanders, France, Spain, and Italy. In this journey he laid in a large stock of knowledge of men and things, and obtained an acquaintance with modern languages very unusual at that period. His love of literature did not prevent him from performing his duty to his employers. He negotiated a supply of the best barilla, at a cheap rate, from Alicaut, and engaged some able workmen at Venice and other places. He returned to London in the winter of 1621; in the following year he went to Spain, and during his absence was chosen fellow of Jesus college. In 1624 he had acquired such reputation that he was made secretary to lord Scrope, president of the North, and in 1627 was chosen member of parliament for Richmond, Yorkshire. In 1630 he accompanied Robert, Earl of Leicester, who was appointed ambassador extraordinary to the court of Denmark, in quality of his secretary, and displayed his oratorical talents in Latin speeches before the king of Denmark and some German princes. He was afterwards employed in state affairs, and in 1640 became clerk of the council; but in 1643 his papers were seized by order of parliament, and he was committed to the Fleet, where he supported himself by his pen. His writings were numerous, but chiefly of a temporary kind. He is chiefly known as an author by a Collection of Letters, in one volume, octavo, containing much of the history of the times. In the reign of Charles I. he was esteemed a royalist, but his remarks upon the fatal catastrophe which terminated that inglorious reign showed that he felt nothing for the fate of the monarch. He flattered Cromwell, and by his bending temper he was made historiographer to Charles II. He died in 1666, and the following inscription is to be seen on his tomb in the Temple church: "Jacobus Howell, Cambro-Britannus, Regius Historiographicus (in Anglia primus); qui po sufficiente peregrinatione tandem naturae curium peregrinatos, fatus etiam eorum in fama, domi forisque: huc usque erat suis erat, hic est annis. 11. Biogr. Brit."

HOWILEMUR, in Geography, a town of Persia, in the province of Gilan; 90 miles N.W. of Refid.

HOWITZERS, in Artillery, are a kind of mortars, invented by the Germans about the year 1593 or 1594, which are mounted upon carriages like travelling gun-carriages, and have their trunnions placed nearly in the middle. The construction of howitzers is as various as that of mortars, excepting the chambers, which are all cylindrical. They are distinguished by the diameter of the bore, e. g. a ten inch howitzer is that, the diameter of which is 10 inches. Howitzers are capable of doing great execution, by firing shells and grape of shot, in a large where the distance is small, and in the field, if they were placed in the flanks or between the batteries. They are also more easily carried from one place to another than mortars. For the dimensions of different howitzers, and remarks on their construction, the reader may consult the article CANNONS.

HOWKER, or HICKER, a vessel much used by the Dutch; built something like a pink, but rigged and sailed like a hoy. Howkers carry from 50 to 200 tons; and, with a small number of hands, will go to the East Indies. They are commonly navigated with two masts, viz. a main-mast and a
HOWE L.E., in Ship-Building. When the foot-hooks of a
ship are feared into the ground-timbers, and bolted, and the
then the planks laid on them up to the orlop, the carpenters say,
they begin to make the ship howl.

HOWSTACK, in Geography, one of the smaller Shet-
land islands, near the E. coast of Mainland. N. lat. 60° 25'.
W. long. 2° 10'.

HOWTH, a peninsula on the W. coast of Ireland, which
to the eastward, on the north of Dublin bay. The
hill of Howth is an important guide to the mariner, and a
light-house has been erected on it in a conspicuous situation.
As, however, the bay of Dublin is often difficult of access,
and as the bar is a great impediment to the sailing of the
packets at a fixed hour, the attention of government has been
directed to the forming of an harbour on the north side
of the peninsula of Howth; and a very fine pier is now
(1811) erecting for this purpose under the direction of
able engineers. It is expected that this new harbour will not
only answer as a much better station for the packet-
boats, but will also contribute to improve the trade of
Dublin. The pier commences nearly under the small town
of Howth, and extends towards Ireland's eye. The point
of Howth is in N. lat. 53° 21'. W. long. 6° 5'.

HOWR, a small poit-town of the county of Dublin,
province of Leinster, Ireland, on the northern side of the
peninsula noticed in the last article. It is seven miles from
Dublin.

HOXTER, a town of Westphalia, belonging to the
abbey of Corvey, three miles N.W. of it, but given to the
king of Prussia in 1802.

HOY, one of the larger Orkney islands, about 11 miles
long and more than three broad, separated from Pomona
by a channel about a mile and a half wide. Round the coast
are several bays, in which there is good fishing. The prin-
cipal places are Hoy and Southwall. N. lat. 58° 43'.
W. long. 3° 7'.

HOY, a small seaport or bark, usually rigged like a fop,
and employed for carrying passengers and luggage from one
place to another, particularly on the sea-coast. In Holland
the hoy has two masts; in England it has but one, when the
main-fall is sometimes extended by a boom, and sometimes
without it.

Hoy Head, in Geography, a cape on the W. coast of the
island of Hoy. N. lat. 58° 38'. W. long. 5° 12'.

HOY, in Botany, named by Mr. Brown in honour of
Mr. Thomas Hoy, F.L.S. an experienced botanist, and able
Aceph. 15. Prodr. Nav. Holl. v. i. 459. — Clasf and order,

Eff. Ch. Corolla wheel-shaped, five-leaf. Crown of the
flowers in five depressed fleshly leaves, whose inner angle
extends into a tooth on each anther. Anthers terminated
by a membrane; filaments of pollen attached by their base,
Seeds comose.

A genus of twining or decumbent shrubs, with opposite
leaves, and many-flowered umbels flanging between the
foot-flanks. Two species only are defined by Mr. Brown,
though he suspects the third of them may prove, when
properly understood, to comprehend several hitherto confounded.

H. carnea. (Aclepia carnea; Linn. Suppl. 1750.
Exot. Bot. v. 2. 21. t. 70. Stapelia chinenfis; Linn.
Cochinch. 205.) — Leaves elliptico-oblong, fleshly, Corolla
downy. Leaflets of the crown furrowed underneath.

Native of various parts of Asia, as well as of New Hol-
land, within the tropics. The late Hon. Mrs. Barrington
received the living plant from the straits of Sunda, and it
flowered in her hove for several successive seasons, from
May to July. The whole flower is succulent and smooth.
Stem climbing, round, downy above. Leaves two or three
inches long, highly revolute, pale beneath, on thick flakcs.
Flowers extremely beautiful and fragrant, in large globose
umbels, resembling a mixture of honey and the lelia of
Heliotrope. They are blush-coloured, with a purple centre;
the corolla downy; the stamens crown smooth and polished,
like porcelain.

2. H. viridispora. (Aclepias valubulis; Linn. Suppl.
1750. Watia-kaka-codi; Rhede Malab. v. 25. t. 15.)

Leaves ovate, pointed, membraneous, smooth, as well as the
corolla. Crown without flurrows. Brown Native of woods
in Ceylon, A. gymn. Smooth in all its parts. Leaves ovate
or heart-shaped. Flowers green, without scent.

HOYA, in Geography, a principality of Germany, bounded
on the N. by the county of Dahlenhorft, the territory of
Bremen, and the Wefer, on the E. by the principalities
of Lüneburg and Calenbg, on the south by the principality
of Minden, and on the W. by the county of Diepholz;
about 32 miles long and 29 broad. In this district the heaths
are large and the land sandy; nevertheless it contains some
good pastures in arable lands, producing wheat, rye,
better, oats, flax, and buckwheat. On the sides of the
rivers are good meadows. The chief rivers are the Wefer
and the Aler. The inhabitants are partly employed in
agriculture and breeding of cattle, and rearing of bees,
and partly in manufacturing linen, woollen, stockings, &c.
Most of the peasants are bonndies. The county com-
prehends 54 parishes, in which Lutheranism is professed.
Hoya was annexed to the dominions of the elector of Han-
over in 1705; a small part excepted, which belonged to
Heife-Caffel. It contains 17 small towns, besides the capital
of the same name, situated on the Wefer. N. lat. 52° 51'.
E. long. 9° 12'.

HOY, La., a town of Mexico, in the province of New
Biscay; 90 miles N.W. of Parral.

HOYACHU, in Botany, the name given by the Chinese
to the acacia tree. They make great use of this tree in
arts and medicine. They have a way of striking a lime yellow
upon paper with its flowers; and they give the seeds in se-
feral diseases, in some of which, as in the dysentery and
hemorrhages, they are of great service. But, beside these,
they make an odd medicine of them, which they take
with great readiness for purposes it can never answer. They
pick out the seeds carefully from the pods, as soon as ripe;
they put these into a flat vessel, and cover them with ox's
gall; this is to be set for a hundred days to dry, in a place
where the sun does not come; after this, one of these seeds
is to be swallowed every day before the first meal; and,
by continuing this a proper time, they say the eye-light, if loth,
is restored, and their gray hair becomes black. Obscr. fur
les Comptes de l'An 21, p. 240.

HOYER, in Geography, a town of Denmark, in the
duchy of Sleswig, with a harbour for small vessels, situated
on the coast of the North sea, celebrated for its salt-
fishery; 6 miles W. of Tondern.

HOYERSWEDA, a town of Luflia, on the river
Eltin; 34 miles N.N.E. of Dreniv. N. lat. 51° 26'.
E. long. 14° 16'.

HOYLAND, a town of Norway, in the diocese of
Drontheim; 92 miles N.N.E. of Drontheim.

HOYLE LOUTH, one of the many large lakes in the county
county of Wexford, province of Leinster, Ireland, and
remarkable for the circumstance of two rivers flowing in op-
posite directions from it. This lake is about 3 miles N. from
Mullingar.

HOZA, a town of Lithuania, in the palatinate
of Troki; 8 miles N. of Grodno.

HOZARDARA, a town of Perșia, in the province
of Itrak; 21 miles S. of Isfahan.

HOZIER, Peter d', Seigneur de la Garde, in Prov-
ence, a gentleman distinguished by his genealogical and his-
torical researches, was born at Marseille in 1592. He re-
ceived a good education, and then entered into the army under
the count de Crequi, the genealogy of whose family he drew
up. His success in this attempt caused him to be em-
ployed by several other noble families in a similar service.
To favour his pursuits, he obtained, in 1623, a place among
the gentlemen of the king's household. He was raised to
other polls of honour, and in 1628 the order of St. Michael
was conferred upon him by Lewis XIII. He was, imme-
diately after this, pensioned by the court, expressly for the pur-
pose of affording him leisure for his curious researches con-
cerning the illustrious families of the kingdom, of which, by
his long labours, he had acquired a particular knowledge.
In 1642, he was made maître-d'hôtel to his majesty,
and in 1654, was raised to the dignity of counsellor of state.
He died at Paris in 1660. He was author of
A History of Britanny, in folio, and a number of
genealogies, some of which were printed, and others
left in MS. His private character was highly estimable;
and so good was his memory, that he was able to
answer at once any question concerning arms, contracts,
affinities, dates, &c. relative to all the families which had
been the subjects of his enquiries, so that it was said jokingly,
"that he might have been proficient at all the mar-
rriages and baptisms in the universe." He left a son Charles
Reynet, who succeeded him in the office of judge of arms,
and was honoured by the duke of Savoy with the knight-
thood of St. Maurice. He died at Paris in 1732, and had
been distinguished by his knowledge of heraldry. He
had written several works by order of Lewis XIV., par-
icularly Le Nobiliaire de Champagne." The nephew of this
gentleman, Lewis Peter d'Hozier, was also his successor in
office: he died in 1767. During the period of his admin-
istration appeared "L'Armorial ou Registres de la Noblesse de

HOZING of Dogs, the cutting out the balls of their
feet. See EXPEDITION.

HOZOW, in Geography, a town of Poland, in the
palatinate of Kiev; 30 miles S.W. of Bialacierz.

HRADNITZ, a town of Bohemia, in the circle of Kon-
giugratz; 12 miles S.E. of Konigigartz.

HRADISCH, or Hradista, a town of Moravia,
capital of a circle of the same name, seated on an island
in the river Morav, famous for its excellent wine and fruit;
30 miles S. of Olmuzt. N. lat. 49° 5', E. long. 17°
24'.

HRADITZ, a town of Bohemia, in the circle of Ra-
konitz; 15 miles S.W. of Rakonitz.

HRASGRAD, a town of European Turkey, in Bulga-
ria; 32 miles S. of Ruzcek.

HREBNIA, a town of Lithuania, in the palatinate of
Minik; 16 miles S.S.E. of Minik.

HRESK, sown of Lithuania, in the palatinate of Novo-
grodok; 10 miles N.N.E. of Sluck.

HROZOW, a town of Lithuania, in the palatinate of
Novogrodok; 18 miles N. of Sluck.

HUA. See FAIFO.

HUB

HUACRE-CHUCO, a town of Peru, in the audience
of Lima, and jurisdiction of Guamalies.

HUACLE, or Huacene, one of the Society
islands, in the South Pacific ocean, situated in S. lat. 16°
45', W. long. 150° 2', first discovered by Cook in 1769,
and visited again in 1777, when he left Omaia, after his visit
to England, in possession of a house and land, which he took
care to provide for him. This island is distant from Otaheite
about 31 leagues, in the direction of N. 58° W., and is
about seven leagues in compass. Its surface is hilly and un-
evenc, and it has a safe and commodious harbour, called by
the natives "Owalle," or "Owahre," lying on the W. side,
under the northern most high land, and within the north end
of the reef, which passes along that side of the island. This
harbour may be entered by two inlets or openings through
the reef, about 14 mile distant from each other: the
furthermost being the wider, and having on the south side of
it a very small sandy island. The productions of this
island are much the same with those of Otaheite, but about
a month forwarder. Of the coco-nuts the inhabitants
make a food which they called "Poë," by mixing them
with yams; they scrape both fine, and having incorporated
the powder, they put it into a wooden trough, with a number
of hot stones, by which they make a kind of oily hasty-pud-
ing, which the English sailors liked very well, especially
when fried. The inhabitants are nearly the same with those
of Otaheite, with regard to person, dress, language, and other
circumstances pertaining to their disposition and character.
They are, however, of a larger size, and of a flouter struc-
ture. Mr. (Sir Joseph) Banks measured one of these men,
and found him to be six feet three inches and a half high;
but they are invisibly lazy. The women were fairer than
those of Otaheite, and in general more handsome. Perfumes
of both sexes seemed to be left timid and less curious.
Although they were not strictly homely, yet it is acknow-
ledged, to their honour, that when they understood that one
of their number had been detected in the act of stealing,
they manifested strong signs of disapprobation, and pre-
ferred a good beating for the thief, which was immediately
administered. In this island they observed a kind of chaff or
ark, the lid of which was nicely sewed on, and thatched
very neatly with palm-nut leaves, it was fixed upon two poles,
and supported on little arches of wood neatly carved; the
poles served to remove it from one place to another.
In one part of it was a square hole, in the middle of which was a
ring, touching the sides, and leaving the angles open, so as
to form a round hole within a square one. See Ark.

HUACLE, a town of Arabia, in the province of Had-
fjar, on the W. coast of the Persian gulf. N. lat. 25° 45',
E. long. 55'.

HVALSOE, a small island on the North sea, near
the coast of Norway. N. lat. 69° 40'.

HUANACO, in Zoology, a Peruvian animal of the
camel tribe. See Camelus Huancas.

HUARTE, John, in Biography, a native of French
Navarre, who was distinguished in the seventeenth
century by a Spanish work of great merit, entitled, "A Trial of
the Wits, or a Treatise on the Different Kinds of Genius among
Men, with Rules and Directions, shewing to what Kind of
Study any Perfon is best Adapted." The book has been
translated into English. Moreri.

HUBAIAN, in Geography, a town of Perßia, in the
province of Farzilatan; 50 miles E. of Baiza.

HUBALD, Hubald, or Hubald, in Biography, a
monk of St. Amand, in Flanders, who preceded Guido
more than a hundred years, was contemporary with Remi,
and author of a treatise on music, which is still subsisting in
the
the king of France's library, under the title of "Enchiridian Musicæ," No. 7232, transcribed in the eleventh century. In this work there is a kind of gamut, or expedient for delineating the several sounds of the scale, in a way wholly different from his predecessors; but the method of Guido not only superseded this, but, by degrees, effaced the knowledge and remembrance of every other that had been adopted in the different countries and convents of Europe. However, the awkward attempts at finging in consonance, which appear in this tract, are curious, and clearly prove that Guido neither invented, nor, ruder as it was before his time, much contributed to the improvement of this art.

Hubald places the whole force of his diaphonies, or harmony, upon fourths and fifths.

The good monk, if to these two parts two more are added in the octave, the harmony will be complete; and then writes, after his manner, the same fragment of melody over again, with a very small change at the end in the accompaniment, which he calls organum; which fee. It is easy for a professed musician to divine what a strange effect such a combination of sounds would have. At length, however, growing still more daring in his experiments, in the eighteenth chapter the question is, "How much higher the principal melody may go than the organum," and the ingenious monk determines the point by allowing that while one voice remains in the same tone, the other may wander about at its pleasure. The succession of four 3ds in the next example, renders it more like music of this world, in point of harmony, than any of the rest. And, indeed, a very few alterations in the under part would make the whole fragment supportable to modern ears.

Hubald, the respectable author of these curious specimens of crude harmony, was not only a musician but a poet; and an idea may be formed of his patience and perseverance, if not of his genius, from a circumstance related by Sigebert, the author of his life, by which it appears that he vanquished a much greater difficulty in poetry than the lipogrammatici of antiquity ever attempted: for they only exchanged a single letter of the alphabet from a whole poem; but this determined monk composed three hundred verses in praise of baldhes, which he addressed to the emperor Charles the Bald, and in which he obliged the letter C to take the lead in every word, as the initial of his patron's name and infirmity, as thus:

"Carmina Clarifone Calvis Cantate Camene."

These examples will sufficiently indicate the infant state of counterpoint previous to the time of Guido, and enable the reader to judge whether it was much improved by his discoveries.

Hubald died in 930, at the age of ninety. See Counterpoint.

HUBARA, or Houbara of Buffon, in Ornithology, the ruffed buffard of Latham. See Otis.

HUBARLIK, in Geography, a town of Pruissen Lithuaniæ; 25 miles E. of Bialacerkew.

HUBBARDSTON, a township of America, in Worcester county, Mallasuchetts, incorporated in 1767; containing 1115 inhabitants; 60 miles W. of Bolton.

HUBBER, a small island in the Baltic, between the island of Ufedom and the continent. N. lat. 54° 38'. E. long. 13° 40'.

HUBBERTON, a township in Rutland county, Vermont, containing 572 inhabitants; 70 miles N. of Bennington.

HUELI, a town of Hindoostan, in the country of Sanore; 20 miles N.W. of Sanore. N. lat. 25° 53'. E. long. 75° 24'.

HUBER, John-James, in Biography, a celebrated anatomist, was born at Balle in 1707. He was a pupil of the great Haller at Berne in 1730: after which he studied at Strasburgh, and in 1733 took the degree of M.D. at his native place. He visited Paris in 1735; and in the same year was appointed physician to the court of Baden Dourch. At the request of his predecessor, Haller, who had removed to Göttingen, he examined the Granbund mountains of Switzerland, and transmitted to him his collection of plants found in that district, previous to the publication of Haller's work on the botany of Switzerland. The author acknowledged the service of Huber in his preface, and invited him to Göttingen, in 1738, to be his assistant. He speedily rose to considerable reputation, being made extraordinary professor of anatomy in that city in 1739; professor in the Caroline college at Caffel, with the rank of court-physician, in 1747; and counsellor of state and body-physician to the prince, in 1748; whose office he continued to fill during thirty years, and died in 1778. He had the honour of being elected, without his knowledge, into the most celebrated of the learned societies of Europe. The chief objects of his researches were the structure and ramifications of the spinale marrow, and the nerves originating from it; the supposed influence which the imagination of the mother has over the child; and the cause of miscarriages. His principal works are entitled, "Commentatio de Medulla Spinali, speciatis de Nervis ab ea provenientibus," sum icon. Gött. 1741, 46o. "Commentatio de Vaginis Uteri, structura rugosa, nee de Hymene," 1742, 4to. He published a letter in the Philos. Transactions, vol. 46. "De cadaver aperto in quo non exitit vesica fellea, et de Sterno gibbofo." Gen. Biog.

HUBERT, Matthew, was born of humble parents, at Chatillon, on the Maine, in the year 1630. He was educated for the church, and was admitted into holy orders as soon as he had attained the proper age. His eloquence as a preacher caused him to be noticed, and followed by vast crowds. His popularity did not produce in his mind any ill effects: he was distinguished for piety, humility, and a general kindness and fulness of manners. He was not alarmed, at the highest pitch of his popularity, by his low origin, or of the obligations he had been under to his friends. Meeting once, in company, with a person of distinction, who endeavored to gain his confidence, he recognized in Hubert an old fellow-attendent; he replied, with emotions of pure and unaffected gratitude, "That is a circumstance which I can never forget, for you had the goodness not only to furnish me with books, but to bestow on me a part of your clothes." He died in 1717 at the age of 77. Six volumes of his sermons were published by father Monteuil in 1725, which were, at one time, as much read in the closet, as they had been admired from the pulpit. Moreni.

HUBERT, St., anciently Andainum, or Andagiam, in Geography, an ancient town of France, in the department of the Forets, situated in the foreest of Ardenes, on the small river Homme. It took its name from an abbey of Benedictines, where the remains of St. Hubert were deposited in 825, in compliance with the decree of a council, held at Aix-la-Chapelle; 25 miles N.W. of Aix. N. lat. 50° 1'. E. long. 5° 27'.

HUBERT, St., Order of, an order of knighthood, instituted, in the days of Juliers, by Gerard V., duke of Juliers, in memory of a victory gained by him over Arnold of Egmont, on St. Hubert's day, in the year 1147. In 1709 it was revived by John-William, elector-palatine of the Rhine. The reigning elector-palatine is grand master. It was also used at Wurtemberg, where the reigning duke of Wur-
temberg was grand master. The collar of the order is a chain of gold, to which is pendent a cros patée, set with jewels, from the angles of which issue rays of gold; on the centre is a medallion of gold enamelled, with a portrait of St. Hubert, kneeling before a crucifix, placed between the horns of a stag standing in a wood, all proper. The knights also wear, on the left side of their coat, a circle surrounded with rays, embroidered in gold; and in the middle of it, on a red ground, some German words, signifying “Keep firm in the Faith.” At all times, except festival days, they wear the cros tied to a red ribbon, which passes scarlet from the left shoulder to the right thigh.

HUBKOW, in Geography, a town of Poland, in Volhynia; 64 miles N.W. of Zyтомiers.

HUBNER, John, in Biography, a German historian and geographer, born in 1668, was celebrated likewise as an instructor of youth, and became rector of the school of Hamburg. He died in 1732, and is known to posterity by several useful compendiums in history, geography, &c., which have been translated into several languages. His chief works are, “Bibliotheca Historica Hamburgeri”; “Museum Geographicum.”

HUBS, in Rural Economy, a term applied in some districts to the names of wheels of certain kind.

HUCAMYBUFF, in Agriculture, a term applied in some places to such coarse tufty grass as remains after eating down the more luxuriant pasture lands by live stock, and which is afterwards mown and made into rough for hay. This sort of work is in other districts often denominated “hopping.” It is often pronounced “hagusty” by the farmers.

HUC-HOI-LO-TCHUAN, in Geography, a town of Corea; 600 miles E.N.E. of Peking. Lat. 42° 27’.

Huch, or Hucho, in Ichthyology. See Salmo Hucho.

HUCKABACK, in Commerce, is a kind of linen, on which the figures are raised.

HUCKÉSWAGEN, in Geography, a town of the duchy of Berg; 24 miles E.S.E. of Düllefeldorff.

HUCKLE BONE, the hip-bone. See Coxe Osfa.

HUCQUELERS, in Geography, a town of France, in the department of the departments of Calais, and chief place of a canton, in the district of Montmorency; nine miles N.E. of it. The place contains 710, and the canton 11,967 inhabitants, on a territory of 2,424 square miles in 24 communes.

HUCKSTER, one that sells provisions or small wares by retail.

HUD SHEAF, in Agriculture, the name by which the sheaf that covers the top of the haystack is frequently known. See Hubber.

HUDDE, John, in Biography, a burgomaster of Amsterdam, who flourished in the eighteenth century, and died in 1734, was eminent in his character of magistratte, and possessed a commanding genius for mathematical studies. Much was expected from his talents as a man of science, but he was diverted from the pursuit by state affairs. He nevertheless the author of several excellent little pieces “On the Reduction of Equations”; “De Maximis et Minimis,” and his “Commentary on the Geometry of Descartes.” &c. Moreri.

HUDDLEGUR, in Geography, a town of Hindooistan, in Orilis; 15 miles N. of Boid.

HUDDER, in Agriculture, a name given, in many counties, to the sheaf by which the haystack is covered and protected at top from the effects of rain, &c.

HUDDERSFIELD, or HUTHERSFELD, in Geography, a market-town and parish in the West Riding of Yorkshire, England, is a large improving place, noted for being the centre of a manufacturing district. The parish consists of the following hamlets, or townships; Quarmby with Lindley, Longwood, Golcar, and part of Scamandal, Slaughtwhaite, and Marsden, all of which are chiefly occupied by persons engaged in different branches of the woollen manufacture. The goods made here consist chiefly of narrow plain cloths, both fine and coarse, with some broad cloths, cloths, beaverettes, kersey-meres, &c. For the display and sale of these, a commodious building, of a circular form, called the Cloth-hall, was erected here, in 1765, by Sir John Ramsden, who possessed nearly the whole of the land on which the town is built, and also a great many houses. The building consists of two stories, and is divided into two courts. All the windows open to these areas. A market is held here every Tuesday, which commences early in the morning, and is closed at half past twelve o’clock at noon. The retail of manufacturers, wool-binders, &c. to this mart, is very numerous, many of whom come from Leeds, Halifax, Wakefield, and other places in the vicinity. Besides the market here are three annual fairs. The police of the town is under a constable and his deputy, who are annually chosen, or rather appointed, by the Ramsden family at their court-leet held at Almonbury. Hudderfield is 14 miles west of Wakefield, and 188 from London. In the year 1800 it contained 1,939 houses, and 7,268 inhabitants. In the vicinity of the town are the following seats: Whitley-hall, belonging to the Beaumont family; Kirkles-hall, the property of Sir George Armitage, bart.; Fixley-hall, the seat of Thomas Thorhill, esq.; and Millsbridge, belonging to W. Radcliffe, esq. Mill of Almonbury is an eminence called Castle-hill, on the summit of which is an ancient entrenchment, supposed by some topographers to have been the Roman Cambodunum; but Mr. Watton, in his History of the Saxons, and thinks, that Slack, to the north of Huddersfield, was the site of that station. The Roman road from Manchester, Lancastria, to York, Eboracum, passed near Almonbury, and the name, and contiguity to the Roman road, are against Mr. Watton’s conjectures.

HUDDERSFIELD CANAL, an inland navigation in Yorkshire and Lancashire, begun in pursuance of acts of parliament passed in the years 1793 and 1800, of which we gave an account in our article Canal, and have here only to add, that the locks are 72 feet long, and nine feet wide, and generally rise about ten feet; there is a tunnel about 200 yards long, S.E. of Scout Mill, near Afton-under-lyne; an aqueduct of cast-iron, 50 or 60 feet long, having a stone bridge of one arch by its side for the towing-path: these were erected in 1801 and 1802. At Wright’s Mill the canal crosses the Tame, to its western side, just after it has entered Yorkshire, on a two-arch stone aqueduct. The canal has been now a long time completed, and is used, from its western end, about eight miles to Woolroyd, and from its eastern end to Diggle in Saddleworth; and at this time, the great tunnel 32 miles long and 250 yards beneath Pule Hill on the grand ridge, is, we believe, very nearly finished. The bridges on this canal have been improdently constructed, many of them, even under the public roads, without towing-paths under them, and must be taken down and widened. On the 29th of November, 1810, a second accident happened to the refervoir on Staneedge, containing 28 acres, burnt, and inundated the valleys below.

HUD-SJERA, a town of Arabia Felix, in the province of Yemen; 36 miles W.N.W. of Sana.
HUDSON, Henry, in Biography, a distinguished naval commander, of whom nothing is known till about the year 1627. At this period he was sent out on an expedition, by some London merchants, in a small vessel for exploring a north-east passage to Japan and China. This daring adventurer met with no accident, and proceeded beyond the 80th degree of latitude in the North sea, when, being tugged by the ice, they returned and arrived at England in the following September. In a second voyage he landed at Nova Zembla, but proceeded no farther east, and returned in August. In 1659 he was fitted out for a third voyage by some merchants of the Dutch-East-India company, and after another unsuccessful attempt to the eastward he steered for the American coast, and went down as far as Chesapeake-bay. His crew, dissatisfied with their want of success, prevented him from endeavouring to find a westerly passage through Davis's strait, and he returned in November. In a fourth voyage he came, June 14th 1657, within sight of Greenland, and proceeding westward, he reached, in fifty degrees of latitude, the mouth of the strait bearing his name. Through this he advanced along the coast of Labrador, to which he gave the name of Nova Britannia, till it issued in the vast bay which perpetuates the memory of Hudson. At first he thought he had discovered the long sought-for passage to the north-west, but experience taught him that it was only a bay, and he resolved to winter in it. They found provisions during the winter season, but at the approach of spring they were reduced to the utmost difficulties. The commander forgot his own sufferings in the hope of making new discoveries, but his crew, not having the same motives for patience and perseverance, began to mutiny, and he threatened to set them on shore. They, on the other hand, willing to anticipate the execution of his purpose, seized Mr. Hudson, his son, and seven others, who were most attached to him, and putting them on shore at the west end of the strait, left them to perish by the waves, or other hardships. Such was the end of Henry Hudson, a man illustrious in the annals of naval discovery.

HUDSON, John, was born in 1662 at Widehope, near Cockermouth, where he received the early part of his education, and at the age of fourteen he was admitted into Queen's college, Oxford. In 1684 he took his degree of M.A. and then removed to University college, of which, in two years after, he was chosen fellow. In 1701 he was elected head-keeper of the Bodleian library, against the competition of the learned Wallis, afterwards Arabic professor. He now took his degree of D.D., and in 1712 he was made principal of St. Mary-hall. He employed the advantages of his situation in editing several of the most valuable authors of antiquity. Of these the following may be mentioned, "Velleius Paterculus," "Thucydides," "Geographie Veteris Scriptores Graeci Minores," "Dionylius Halicarnassius," and "Longinus." The editions of Dr. Hudson are valued for their elegance and correctness. He never professed any ecclesiastical preferment, and died at St. Mary-hall in Nov. 1719. Biog. Brit.

HUDSON, Thomas, a portrait painter, who enjoyed for many years the principal repute and practice of the profession in London, after Richardson, under whom he studied, and Jervas were gone. Yet, though confessedly the best of his time, it is but small praise to say so of him; he will be longer remembered as the master of an illustrious pupil who soon eclipsed him, when he began to appear before the public, and who yet remains unrivalled, Sir Joshua Reynolds. Hudson certainly improved upon the taste of the artists who immediately preceded him, and who had fallen in succession from Kneller, into the utmost imbecility of practice as well as feeling in the art. For a while his successes were interrupted by Vanloo and Liotard, but the English gentry in general were faithful to their compatriot, and were content with his honest imitations, with fair tied wigs, velvet coats and white satin waistcoats, duly gilt and embroidered.

When Reynolds began to practice and gain fame, Hudson was advanced in years, and having acquired an independence in fortune, he retired and left the field to his youthful rival, after having finished his most capital performance, the family piece of Charles duke of Marlborough.

He went to reside at a beautiful villa which he built at Twickenham, where he died in 1779, at the age of 78. He was twice married, first to the daughter of his master Richardon, and afterwards, towards the close of his life, to a Mrs. Fiennes, a gentlewoman of good fortune, to whom he bequeathed his villa, with an excellent collection of cabinet pictures and drawings by the old masters.

HUDSON, William, one of the earliest Linnean botanists in England, was born in Wiltmoreland, about the year 1750. He served his apprenticeship to an apothecary in Panton street, Haymarket, to whose business he succeeded, and with whose widow and daughters he continued to reside. His acquaintance with the amiable and learned Mr. Benjamin Stillingfleet greatly advanced his taste and information in natural history. This gentleman directed his attention to the writings of Linnaeus, and gave his mind that correct and scientific turn, which caused him to take the lead as a classical English botanist, and induced him to become the author of the Flora Anglica, published in 1762, in one volume octavo. The plan of this book was, taking Ray's Synopsis as a ground-work, to divide his plants in order, according to the Linnean system and nomenclature, with such additions of new species, or of new places of growth, as the author or his friends were able to furnish. The synonyms of the most valuable authors, since the time of Ray or Dillenius, were superadded, as well as descriptions of new or rare plants; and even new specific characters, wherever the English specimens did not well answer to the definitions in Linnaeus. Some few generic alterations were also made; but for the most part the Linnean definitions in this department were relied on. Many synonyms also were copied from Linnaeus or other writers, as appears by errors of the press retained in the trancribing. Of this too common fault we have had occasion to take notice on some other occasions, but we by no means intend to affect that Mr. Hudson consulted none of the authors he quoted. On the contrary, we believe such blind transcription was more rarely practiced by him than by many other writers. The particular places of growth of the rarer species were given in Ray's manner, in English, though the title of the book was Latin. The elegant preface was written by Mr. Stillingfleet, and probably the concise, but not less elegant, dedication to the late duke of Northumberland, "aritium, tum utilium, tum elegantiorum, judicis et patronum."

This publication gave Mr. Hudson a considerable rank as a botanist, not only in his own country, but on the continent, and derived no small advantage from a comparison with Dr. Hill's attempt of the same kind. He had indeed previously, in the course of his medical practice, formed some valuable connexions, which were cemented by botanical taste, and he found leisure, from time to time, to visit several friends in the course of his botanical expeditions, especially in Devonshire. His correspondence with Linnaeus, Halter, and others, as well as amongst his countrymen, was frequent.
frequent and very useful to him in the course of his studies, which were extended not only to botany in all its cryptographic minute, but, with great ardour also, to insects, shells, and other branches of British zoology. He was elected a fellow of the Royal Society Nov. 5th, and admitted Nov. 12th 1761. He took the lead very much in the affairs of the Apothecaries' company, and was their botanical demonstrator in the Chelsea garden for many years.

Mr. Hudson, having never married, continued to reside in Panton street with the last-surviving daughter of his friend and master, an amiable and valuable woman, married to Mr. Hole; nor did he remain in his attention to science or business. There the writer of the present narrative often visited him, and experienced his kind, though somewhat reserved, communications and favour. His Flora being grown very scarce, infomuch that a copy had been sold for near twenty times its original price, he published, in 1778, a new edition, in two volumes, with many additions, and various alterations. Some of the latter, respecting the species or varieties of graffes, have been thought less advantageous than the rest.

On the whole, however, this edition was worthy of its author, and of the advanced state of the science. The Flora Scotiae of his contemporary Mr. Lightfoot, a man of more popular manners and style, will not bear a comparison with it for authenticity or originality, however pleasing and eligible for the graces it bestowed on even the driest parts of the science.

The merits of this subject of this article were of a higher order. In his social intercourse he courted not the many, but was warmly attached to a few. His moral character was without a flaw, and his mind was established on the foundest principles. His tranquillity received a dreadful shock in the winter of 1783, when his house, and the greater part of his literary treasures, were destroyed by a sudden fire, caught, as it was believed, by the villany of a confidential servant, who knew of a considerable sum in money which his master had received a day or two before. No traces of the gold were found amidst the ruins. The servant, after a treacherous application for affittance, on the pretence of being totally destitute, disappeared. The property had, by accident, been for a short time only, uninsured, and the loss was therefore considerable, in a pecuniary point of view, to a man whose resources were not extensive. He bore the whole like a philosopher and a Christian, giving up his practice, and retiring, with Mr. and Mrs. Hole, to a more economical residence in Jersey street, where he died May 23rd 1793, Mrs. Hole surviving him but a few months.

The accident of the fire entirely defeated a project Mr. Hudson had for many years kept in view, of publishing a Universal History, on the plan of his Flora, for which he had long been collecting materials. His taste for his favourite pursuit remained to the last, unimpaired and unembittered by these disappointments. He became a fellow of the Linnean Society early in 1791, liberally contributing to its infant funds, and attending the meetings as often as his now declining health would allow. His lungs had for many years been an ulcerated state, and he laboured under frequent impothumes in that part; but a succussion of paralytic attacks appear to have been the more immediate cause of his dilution. His resigned and placid exit was conformable to the tenour of his life. His remains were interred at the adjoining church of St. James's. "May the writer of this leave no more errors behind him, as an author, or as a man!" S.

Hudson City, in Geography, a port of entry and port-town of America, in the county of Columbia, and state of New York, on the E. side of Hudson river; 132 miles N. of New York city. This town was begun in 1783, on a spot, accessible by vessels of any size, and was laid out in squares, formed by spacious streets, crossing one another at right angles. Each square contains 30 lots, and each lot is 50 feet in front and 120 feet in depth. From the period of its commencement, the increase of this town has been wonderfully rapid: in two years 150 dwelling-houses were erected, with shops, barns, warehouses, and other buildings, a covered rope-walk, and one of the best distilleries in America; and the number of inhabitants collected in this short interval of time amounted to 1500. Since the year 1786, a printing-office has been established, several public buildings have been erected, with dwelling-houses, stores, &c. The town is abundantly supplied with water, conveyed by pipes to their cellars, from a spring at the distance of two miles. To the southward is a large bay, and it commands extensive views from the eminence on which it is situated. The river is a mile wide, and forms towards the north a number of creeks and bays. From the S.E. to the S.W. the city is bounded by hills, and the distant prospect is terminated by a chain of stupendous mountains, called the "Kanats Hill."

Here is a bank, called "the bank of Columbia," whose capital may not exceed 160,000 dollars, composed of 400 shares, at 400 dollars each. This city is governed by a mayor, recorder, four aldermen, four assessors, and other officers. The number of inhabitants in Hudson township is 3664. N. lat. 42° 14'.

Hudson, a flourishing town in Trumbull county, and state of Ohio, about 33 miles W. of Warren, containing about 200 inhabitants.

Hudson's Bay, an inland sea, so called from the voyager Hudson, who in 1610 discovered the straits which bear his name, and this inland sea, approaching the Baltic in size, which has, however, been denominated Hudson's bay. Hudson's bay may be considered as extending from W. long. 70°, to long. 115°, or 45° of longitude, which, allowing the degree only 30 miles, will be 1350 geographical miles in length, and its medial breadth about 350. The entrance of this bay from the ocean, after leaving to the N. Cape Farewell and Davis's straits, is between Resolution islands on the N., and Button's islands on the Labrador coast, to the S., forming the eastern extremity of the straits distinguished by the name of the discoverer. The shores are generally rocky and precipitous; with some large beaches; the islands of Salifulby, Nottingham, and Digges, are also very lofty and naked. The depth of water in the middle of the bay is 140 fathoms. From Cape Churchill to the S. end of the bay are regular foundings; near the shore shallow with a muddy or sandy bottom. To the N. of Churchill, the foundings are irregular, the bottom rocky, and in some parts the rocks appear above the surface at low water. From Moose river, or the bottom of the bay, to Cape Churchill, the land is flat, marshy, and wooded with pines, birch, larch, and willows. From Cape Churchill to Wager's water, the coasts are all high and rocky to the sea, and delicately of wood, except the mouths of Pockeryskeko and Seal rivers. The hills on their back are naked, nor are there any traces of trees for a great distance inland. The mouths of all the rivers are filled with shoals, except that of Churchill, in which the largest ships may lie; but 10 miles higher, the channel is obstructed with sand-banks; and all the rivers, as far as they have been navigated, abound with rapid and cataracts, from 10 to 60 feet perpendicular. As far inland as the Hudson-bay Company have settlements, which is 600 miles to the W., at a place called "Hudson Houfe," N. lat. 53°. W. long. 106° 27', is flat country. The climate
is almost always wintry, the hot weather in June, though violent, being of short duration. The snows begin to fall in October, and continue to fall at intervals during the winter; the ice on the rivers is eight feet thick. Pasture freezes in a solid mass, and branchy coagulates. The ice begins to disappear in May, and hot weather commences about the middle of June. Mock funs and halloes are frequent and brilliant; the night is lengthened with the Aurora Borealis; and the stars appear with a fiery redness. Thunder, though not frequent, is very violent. The sea does not abound with fish, but it furnishes the common whale, and the beluga or white whale is taken in considerable numbers in June, when the rivers on the south have discharged their ice. Large sturgeons are also caught near Albany. Shell fish are very rare, common muscles excepted, which are frequent. Multitudes of birds retire to this remote country, as well as to Labrador and Newfoundland, from places most remotely south, perhaps from the Antilles; and some even of the most delicate little species. Most of them, with numbers of aquatic fowls, are seen returning southward, with their young broods to more favourable climates. The favours partly regulate their months by the appearance of birds. All the great kinds, ravens, crows, hawks, buzzards, and Lapland fowl, brave the severest winter; and several of the falcons and owls seek shelter in the woods. The rein deer pass in vast herds towards the N. in October, seeking the extreme cold. The male polar bears rove out at sea, on the floating ice, most of the river, and till June: the females lie concealed in the woods, or beneath the banks of rivers till March, when they come out with their twin cubs, and bend their course to the sea in search of their comforts. The large tract of territory on the south of this sea is the property of the Hudson's Bay company, who derive their chief profits from furs. This sea has been repeatedly explored for a N.W. passage to no purpose. Chetserfield inlet, (see Chesterfield,) stretches far to the W., and terminates in a magnificent lake of fresh water, communicating with this sea by a broad river; the adjacent land being level, rich in pasture, and abounding with deer. It is probably believed, that the Hudson sea on the N.E. opens into the Arctic ocean, where the perpetual ice presents an insurmountable barrier to commercial adventurers. The gulf, or sea of Davis, may be considered as part of the sea of Hudson, and probably joins the Arctic ocean.

The regions around Hudson's bay and that of Labrador have been sometimes called New Britain (which see). The parts on the W. of Hudson's bay have also been called New North and South Wales; while that on the E. is called East Main. In the S., James's bay stretches inland about 300 miles by about 500 in breadth; and the most valuable settlements are in that vicinity, as Albany fort, Moose fort, and East Main factory. Further to the S. and on the confines of Upper Canada, are Brunswick house, Frederic house, and some others, belonging probably to the N.W. company. In the N., Severn house is at the mouth of a large river, which seems to flow from the lake of Winnipe. York fort stands on Nelson's river; and still further to the N. is Churchill fort, which seems to be the farthest settlement in that direction. To the W. the Hudson's Bay company had extended little further than Hudson's house; while the superior spirit of the N.W. company, established in 1784, has nearly approached the Pacific. The boundary between the Hudson's Bay company and Canada is understood to follow the ridge that gives source to the rivers flowing N. and S. as far as lake Missippe, so that lat. 49° is said to form the limit. The most important rivers in this country are, the Nelson, or Sackashawin, and the Severn: the comparative course of

Hudson's Bay Company. See Company, and the preceding article.

Hudson's House, a factory belonging to the Hudson's Bay company in North America, on the W. side of the Sackashawin river. N. lat. 53° W. long. 106° 27'.

Hudson's Point, a cape of the island of Antigua, on the S.E. coast. N. lat. 17° 12', W. long. 61° 23'.

Hudson's River, one of the largest and finest rivers in the United States of America, which rises in a mountainous country of New York, between the lakes Ontario and Champlain, and after pursing a southerly course within fix or eight miles of lake George, then a straight course E. and afterwards S. 12 or 15 W., discharges itself into York Bay. The whole length is about 250 miles; from Albany to lake George the course is 65 miles, which is navigable only for bateaux, and has two portages, occasioned by falls, of half a mile each. The passage through the highlands, of 16 or 18 miles, affords a wild romantic scene. The bed of this river, which is deep and smooth to a surprising distance through a hilly, rocky country, and even through ridges of some of the highest mountains in the United States, must have been produced by some signal convulsion of nature. The tide flows a few miles above Albany, which is 160 miles from New York. The river is navigable for fleets of 80 tons to Albany, and for ships to Hudson city. About 60 miles above New York the water becomes fresh. This river is filled with a variety of fish; and it affords singular advantages for carrying on the fur-trade with Canada, by means of the lakes; and its conveniences for internal commerce are very great.—Also, a river broad but short, emptying itself into Chesapeake bay, in Dorchester county, Maryland. Hill's Point, N.E. of it, closes the broad mouth of this river.

Hudson's Strait, or Freihofer's Miffaken Strait, the narrow sea between the Atlantic ocean and Hudson's bay, N. of Labrador. See Hudson's Bay.

Hudson's Bay Porcupine, in Zoology. See Hystrix Dorfetta.

Gen. Ch. Cal. Perianthus inferior, in three deep, lanceolate, obtuse, rather concave segments. Cor. Petals five, falciform, ovate-oblong, obtuse, shorter than the calyx. Stam. Filament 15 or 18, capillary, the length of the corolla; anthers roundish. Fil. Germann superior, ovate; style thread-shaped, the length of the filaments; stigma simple. Pers. Capsule cylindrical, half as long as the calyx, of one cell and three valves. Seeds three, rounded on one side, angular on the other.

Obf. The characters are corrected from the description of Bergius, which escaped the notice of Schreber; who merely copied the Manilla, in which there is said to be no corolla.
HUE.

1. H. ericifolia. Linn. Mant. 74. Wildd. Hort. Berol. v. 1. t. 15. Bergius in Act. Holm. for 1778. 19. t. 1; not 18. t. 2, as in Wilddenow. (Ericaerifolia virginiakensis, floribus exiguis, vasculo seminali oblongo trifarium diviso; Pluk. Mant. 68.)—The only known species, a native of Virginia and other parts of North America, yet Michaux has it not. We saw it alive and in flower at Kew in the spring of 1809. The stem is shrubby, procumbent, round, with very numerous, aeciding, compound leaf branches, greatly resembling a heath. Leaves scattered, small, needle-like, close-prefixed, somewhat imbricated, acute, hairy, especially on the younger roots. Flowers lateral, on slender, hairy, foliary, simple stalks longer than the leaves. Calyx externally downy, internally yellow. Petals and stamens of an uniform lemon-colour, much resembling some small Hypericum.

HUE, in Painting, signifies any degree of strength or vivadeas in a colour, from its greatest or deepest power to the weakest intimation of it.

HUE-AND-CRY, in Law, derived from the French hue and cry, which both signify to shout, or cry aloud, denotes the pursuit of one who has committed felony, &c. on the highway.

If a party robbed, or any in the company of one murdered or robbed, come to the constable of the next town, and require him to raise hue-and-cry, or to pursue the offender, describing him, and dwelling, as near as he can, which way he is gone, the constable is forthwith to call for aid from the parish to seek the felon; and if he is not found there, he is to give the next constable warning, till he be apprehended, or at least pursued to the sea-side.

The Normans had a pursuit with a cry after offenders, not unlike this; which they called clamor de haro. See CLAMOR.

Hue is also used alone, ann. 1 Edw. I. flat. 2. In ancient records it is called butium & clamor, which properly signify a pursuit by horn and by voice.

This procex of pursuing is mentioned by statute Welfm. 1. 3 Edw. I. cap. 9. and 4 Edw. 1. de officio coronatoris. But the principal statute relative to this matter is that of Wincheller, 13 Edw. I. cap. 1. & 4 which directs, that from thenceforth every county shall be so well kept, that immediately upon robberies and felonies committed, hue and cry shall be made from town to town, and they keep the town shall follow with hue and cry, with all the town and towns near; and if hue and cry shall be made from town to town, until they be taken and delivered to the sheriff. And that such hue and cry may more effectually be made, the hundred is bound by the same statute, cap. 3. to answer for all robberies therein committed, unless they take the felon, which is the foundation of an action against the hundred, in case of any lobs by robbery.

By flat. 27 Eliz. cap. 13. no hue and cry is sufficient, unless made with both hornfeme and footmen. And by flat. 8 Geo. II. cap. 16. the constable or like officer refusing or neglecting to make hue and cry, forfeits 5. and the whole vass or district is ill in strictness liable to be aernered, according to the law of Alfred, if any felony be committed therein, and the felon escape. Hue and cry may be raised either by precept of a justice of the peace, or by a peace officer, or by any private man that knows of a felony. (2 Hal. P. C. 100—104.) But if a man maliciously or wantonly raises a hue and cry, without cause, he shall be severely punished as a disturber of the public peace. 1 Hawk.

In supplement to this ancient established, for John Fielding's plan was instituted for the discovery of offenders, after they have escaped the fresh pursuit upon hue and cry, by sending immediate notice to a certain known office in London, from whence are issued weekly accounts to every part of the kingdom, describing the offence and the offenders with as much accuracy as the office will allow. By these means many notorious offenders have been apprehended, and much stolen property hath been recovered.

HUELAMO, in Geography, a town of Spain, in New Castile; 22 miles N.E. of Cuenga.

HUELBA, or HUELVA, a town of Spain, in the province of Seville, situated on the coast of the Atlantic; three miles W. of Moger. N. lat. 37° 13'. W. long. 7° 1'.
